DATASHEET

## X9110

FN8158
Rev 5.00
Dual Supply/Low Power/1024-Tap/SPI Bus, Single Digitally-Controlled (XDCP ${ }^{\text {TM }}$ ) Potentiometer

The X 9110 integrates a Single Digitally Controlled Potentiometer (XDCP) on a monolithic CMOS integrated circuit.

The digital controlled potentiometer is implemented using 1023 resistive elements in a series array. Between each element are tap points connected to the wiper terminal through switches. The position of the wiper on the array is controlled by the user through the SPI bus interface. The potentiometer has associated with it a volatile Wiper Counter Register (WCR) and four nonvolatile data registers that can be directly written to, and read by, the user. The contents of the WCR controls the position of the wiper on the resistor array though the switches. Power-up recalls the contents of the default data register (DRO) to the WCR.

The XDCP can be used as a three-terminal potentiometer or as a two terminal variable resistor in a wide variety of applications including control, parameter adjustments, and signal processing.

## Related Literature

- For a full list of related documents, visit our website
- X9110 product page

## Features

- 1024 resistor taps - 10-bit resolution
- SPI serial interface for write, read, and transfer operations of the potentiometer
- Wiper resistance, $40 \Omega$ typical at 5 V
- Four nonvolatile data registers
- Nonvolatile storage of multiple wiper positions
- Power-on recall, loads saved wiper position on power-up
- Standby current <5 $\quad$ A maximum
- System $\mathrm{V}_{\mathrm{Cc}}$ : 2.7 V to 5.5 V operation
- Analog V+/V-: -5V to +5 V
- $100 \mathrm{k} \Omega$ end-to-end resistance
- 100 year data retention
- Endurance: 100,000 data changes per bit per register
- 14 Ld TSSOP
- Dual supply version of the X9111
- Low power CMOS
- Pb-free (RoHS compliant)

FIGURE 1. FUNCTIONAL DIAGRAM

## Applications

## Circuit Level Applications

- Vary the gain of a voltage amplifier
- Provide programmable DC reference voltages for comparators and detectors
- Control the volume in audio circuits
- Trim out the offset voltage error in a voltage amplifier circuit
- Set the output voltage of a voltage regulator
- Trim the resistance in Wheatstone bridge circuits
- Control the gain, characteristic frequency and Q-factor in filter circuits
- Set the scale factor and zero point in sensor signal conditioning circuits
- Vary the frequency and duty cycle of timer ICs
- Vary the DC biasing of a pin diode attenuator in RF circuits
- Provide a control variable (I, V, or R) in feedback circuits

## System Level Applications

- Adjust the contrast in LCD displays
- Control the power level of LED transmitters in communication systems
- Set and regulate the DC biasing point in an RF power amplifier in wireless systems
- Control the gain in audio and home entertainment systems
- Provide the variable DC bias for tuners in RF wireless systems
- Set the operating points in temperature control systems
- Control the operating point for sensors in industrial systems
- Trim offset and gain errors in artificial intelligent systems

NOTES:

1. Add "T1" suffix for 2.5 k unit tape and reel option.
2. These Intersil Pb-free plastic packaged products employ special Pb-free material sets, molding compounds/die attach materials, and $100 \%$ matte tin plate plus anneal (e3 termination finish, which is RoHS compliant and compatible with both SnPb and Pb -free soldering operations). Intersil Pb-free products are MSL classified at Pb-free peak reflow temperatures that meet or exceed the Pb-free requirements of IPC/JEDEC J STD-020.
3. For Moisture Sensitivity Level (MSL), see product information page for X9110. For more information on MSL, see tech brief TB363.

## Bus Interface Pins

## SERIAL OUTPUT (SO)

SO is a serial data output pin. During a read cycle, data is shifted out on this pin. Data is clocked out on the falling edge of the serial clock.

## SERIAL INPUT (SI)

SI is the serial data input pin. All opcodes, byte addresses and data to be written to the potentiometer pot registers are input on this pin. Data is latched by the rising edge of the serial clock.

## SERIAL CLOCK (SCK)

The SCK input is used to clock data into and out of the X9110.

## HOLD (HOLD)

$\overline{\mathrm{HOLD}}$ is used in conjunction with the $\overline{\mathrm{CS}}$ pin to select the device. Once the part is selected and a serial sequence is underway, HOLD may be used to pause the serial communication with the controller without resetting the serial sequence. To pause, $\overline{\mathrm{HOLD}}$ must be brought LOW while SCK is LOW. To resume communication, $\overline{\text { HOLD }}$ is brought HIGH, again while SCK is LOW.

FIGURE 3. DETAILED POTENTIOMETER BLOCK DIAGRAM

If the pause feature is not used, $\overline{\text { HOLD }}$ should be held HIGH at all times.

## DEVICE ADDRESS (AO)

The address input is used to set the 8 -bit slave address. A match in the slave address serial data stream AO must be made with the address input (AO) in order to initiate communication with the X 9110.

## CHIP SELECT ( $\overline{\mathbf{C S}}$ )

When $\overline{\mathbf{C S}}$ is HIGH, the X9110 is deselected and the SO pin is at high impedance, and (unless an internal write cycle is underway) the device will be in the standby state. CS LOW enables the X9110, placing it in the active power mode. It should be noted that after a power-up, a HIGH to LOW transition on $\overline{\mathrm{CS}}$ is required prior to the start of any operation.

## HARDWARE WRITE PROTECT INPUT (WP)

The $\overline{\mathrm{WP}}$ pin when LOW prevents nonvolatile writes to the Data Registers.

## Potentiometer Pins

## $\mathbf{R}_{\mathbf{H}}, \mathbf{R}_{\mathbf{L}}$

The $R_{H}$ and $R_{L}$ pins are equivalent to the terminal connections on a mechanical potentiometer.

## $\mathbf{R}_{\mathbf{W}}$

The wiper pin are equivalent to the wiper terminal of a mechanical potentiometer.

## Bias Supply Pins

## SYSTEM SUPPLY VOLTAGE (Vcc) AND SUPPLY GROUND (VSS)

The $\mathrm{V}_{\mathrm{CC}}$ pin is the system supply voltage. The $\mathrm{V}_{\mathrm{SS}}$ pin is the system ground.

## ANALOG SUPPLY VOLTAGES (V+ AND V-)

These supplies are the analog voltage supplies for the potentiometer. The V+ supply is tied to the wiper switches while the V-supply is used to bias the switches and the internal P+ substrate of the integrated circuit. Both of these supplies set the voltage limits of the potentiometer.

## Principles of Operation

## Device Description

## SERIAL INTERFACE

The X9110 supports the SPI interface hardware conventions. The device is accessed via the SI input with data clocked-in on the rising SCK. $\overline{\mathrm{CS}}$ must be LOW and the $\overline{\mathrm{HOLD}}$ and $\overline{\mathrm{WP}}$ pins must be HIGH during the entire operation.

The SO and SI pins can be connected together, since they have three state outputs. This can help to reduce system pin count.

## ARRAY DESCRIPTION

The X9110 is comprised of a resistor array (Figure 3). The array contains the equivalent of 1023 discrete resistive segments that are connected in series. The physical ends of each array are equivalent to the fixed terminals of a mechanical potentiometer ( $\mathrm{R}_{\mathrm{H}}$ and $\mathrm{R}_{\mathrm{L}}$ inputs).

At both ends of each array and between each resistor segment is a CMOS switch connected to the wiper ( $\mathrm{R}_{\mathrm{W}}$ ) output. Within the individual array only one switch may be turned on at a time.

These switches are controlled by a Wiper Counter Register (WCR). The 10-bits of the WCR (WCR[9:0]) are decoded to select, and enable, one of 1024 switches.

## WIPER COUNTER REGISTER (WCR)

The X9110 contains a Wiper Counter Register (see Table 1) for the XDCP potentiometer. The WCR is equivalent to a serial-in, parallel-out register/counter with its outputs decoded to select one of 1024 switches along its resistor array. The content of the WCR can be altered in one of three ways: (1) it may be written directly by the host via the write Wiper Counter Register instruction (serial load); (2) it may be written indirectly by transferring the content of one of four associated Data Registers via the XFR Data Register; (3) it is loaded with the content of its data register zero (DRO) upon power-up.

The Wiper Counter Register is a volatile register; that is, its content is lost when the X9110 is powered-down. Although the register is automatically loaded with the value in DRO upon power-up, this may be different from the value present at power-down. Power-up guidelines are recommended to ensure proper loadings of the DRO value into the WCR.

## DATA REGISTERS (DR)

The potentiometer has four 10-bit nonvolatile Data Registers. These can be read or written directly by the host. Data can also be transferred between any of the four Data Registers and the Wiper Counter Register. All operations changing data in one of the Data Registers is a nonvolatile operation and will take a maximum of 10 ms .

If the application does not require storage of multiple settings for the potentiometer, the Data Registers can be used as regular memory locations for system parameters or user preference data.

DR[9:0] is used to store one of the 1024 wiper position (0~1023) (see Table 2).

## STATUS REGISTER (SR)

This 1-bit status register is used to store the system status (see Table 3).

WIP: Write In Progress status bit, read only.

- When WIP $=1$, indicates that high-voltage write cycle is in progress.
- When WIP $=0$, indicates that no high-voltage write cycle is in progress.

TABLE 4. IDENTIFICATION BYTE FORMAT

TABLE 5. INSTRUCTION BYTE FORMAT

## Device Instructions

## Identification Byte (ID and A)

The first byte sent to the X9110 from the host, following a $\overline{\mathbf{C S}}$ going HIGH to LOW, is called the Identification byte. The most significant four bits of the slave address are a device type identifier. The ID[3:0] bits is the device ID for the X9110; this is fixed as 0101[B] (refer to Table 4).

The AO bit in the ID byte is the internal slave address. The physical device address is defined by the state of the AO input pin. The slave address is externally specified by the user. The X9110 compares the serial data stream with the address input state; a successful compare of the address bit is required for the X9110 to successfully continue the command sequence. Only the device whose slave address matches the incoming device address sent by the master executes the instruction. The AO input can be actively driven by CMOS input signals or tied to $\mathrm{V}_{\mathrm{CC}}$ or $\mathrm{V}_{\mathrm{SS}}$. The $R / \overline{\mathbf{W}}$ bit is used to set the device to either read or write mode.

## Instruction Byte and Register Selection

The next byte sent to the X9110 contains the instruction and register pointer information. The three most significant bits are used provide the instruction opcode (I[2:0]). The RB and RA bits point to one of the four registers. The format is shown in Table 5.

Five of the seven instructions are four bytes in length. These instructions are:

1. Read Wiper Counter Register - This register reads the current wiper position of the selected pot.
2. Write Wiper Counter Register - This register changes current wiper position of the selected pot.
3. Read Data Register - This register reads the contents of the selected data register.
4. Write Data Register - This register writes a new value to the selected data register.
5. Read Status - This command returns the contents of the WIP bit, which indicates if the internal write cycle is in progress.
The basic sequence of the four byte instructions is illustrated in Figure 5 on page 7. These four-byte instructions exchange data between the WCR and one of the Data Registers. A transfer from a Data Register to a WCR is essentially a write to a static RAM, with the static RAM controlling the wiper position. The response of the wiper to this action will be delayed by $t_{\text {WRL }}$. A transfer from the WCR (current wiper position), to a Data Register is a write to nonvolatile memory and takes a minimum of $t_{W R}$ to complete. The transfer can occur between the potentiometer and
one of its associated registers. The Read Status Register instruction is the only unique format (see Figure 6 on page 7).

Two instructions require a two-byte sequence to complete (see Figure 4 on page 7). These instructions transfer data between the host and the X9110; either between the host and one of the Data Registers or directly between the host and the Wiper Counter Register. These instructions are:

1. XFR Data Register to Wiper Counter Register - This register transfers the content of one specified Data Register to the associated Wiper Counter Register.
2. XFR Wiper Counter Register to Data Register - This register transfers the content of the specified Wiper Counter Register to the specified associated Data Register.

See "Instruction Format" on page 8 for more details.

## Write in Process (WIP bit)

The content of the Data Registers are saved to nonvolatile memory when the $\overline{\mathbf{C S}}$ pin goes from LOW to HIGH after a complete write sequence is received by the device. The progress of this internal write operation can be monitored by a Write In Process (WIP) bit. The WIP bit is read with a Read Status command (see Figure 6).

## Power-Up and Power-Down Requirements

At all times, the $\mathrm{V}+$ voltage must be greater than or equal to the voltage at $\mathrm{R}_{\mathrm{H}}$ or $\mathrm{R}_{\mathrm{L}}$, and the voltage at $\mathrm{R}_{\mathrm{H}}$ or $\mathrm{R}_{\mathrm{L}}$ must be greater than or equal to the voltage at V -. During power-up and power-down, $\mathrm{V}_{\mathrm{CC}}, \mathrm{V}+$, and V - must reach their final values within 1 ms of each other.

| X9110 | . . 5 V $\pm 10 \%$ |
|  | 2.7 V to 5 |

CAUTION: Do not operate at or near the maximum ratings listed for extended periods of time. Exposure to such conditions may adversely impact product reliability and result in failures not covered by warranty.

NOTE:
7. $\theta_{\mathrm{JA}}$ is measured with the component mounted on a high effective thermal conductivity test board in free air. See Tech Brief TB379 for details.

## Analog Specifications Over recommended industrial (2.7V) operation conditions, unless otherwise stated.

| SYMBOL | PARAMETER | TEST CONDITIONS | MIN (Note 16) | TYP | MAX <br> (Note 16) | UNIT |

|  | Ratiometric Temperature Coefficient |  |  |  | 20 | $\mathrm{ppm} /{ }^{\circ} \mathrm{C}$ |
| $\mathrm{C}_{\mathrm{H}} / \mathrm{C}_{\mathrm{L}} / \mathrm{C}_{\mathrm{W}}$ | Potentiometer Capacitances | See macromodel |  | 10/10/25 |  | pF |

## NOTES:

8. Absolute linearity is utilized to determine actual wiper voltage versus expected voltage as determined by wiper position when used as a potentiometer.
9. Relative linearity is utilized to determine the actual change in voltage between two successive tap positions when used as a potentiometer. It is a measure of the error in step size.
10. $\mathrm{MI}=\mathrm{RTOT} / 1023$ or $\left(\mathrm{R}_{\mathrm{H}}-\mathrm{R}_{\mathrm{L}}\right) / 1023$, single pot
11. $\mathrm{V}_{\mathrm{CC}}, \mathrm{V}+, \mathrm{V}$ - must reach their final values within 1 ms of each other.
12. $n=0,1,2, \ldots, 1023 ; m=0,1,2, \ldots, 1022$.

DC Operating Specifications over the recommended operating conditions unless otherwise specified.

| $\mathrm{t}_{\text {PUW }}$ (Note 14) | Power-Up to Initiation of Write Operation |  | $\mathrm{m} / \mathrm{ms}$ |

## NOTES:

13. Limits established by characterization and are not production tested.
14. $t_{P U R}$ and $t_{P U W}$ are the delays required from the time the (last) power supply $\left(\mathrm{V}_{\mathrm{CC}}{ }^{-}\right)$is stable until the specific instruction can be issued.
15. ESD Rating on $R_{H}, R_{L}, R_{W}$ pins is 1.5 kV (HBM, 1.0 $\mu \mathrm{A}$ leakage maximum), ESD rating on all other pins is 2.0 kV .
16. Parts are $100 \%$ tested at $+25^{\circ} \mathrm{C}$. Over-temperature limits established by characterization and are not production tested.

## AC Test Conditions

warranted. Please visit our website to make sure that you have the latest revision.

| DATE | REVISION | CHANGE |
| :---: | :--- | :--- |
| October 28, 2016 | FN8158.5 | Added Related Literature section on page 1. <br> Updated fSCK maximum specification on page 12. |
| August 3, 2016 | FN8158.4 | Updated entire datasheet applying Intersil's new standards. <br> Updated Note 1 and added Note 3. <br> Changed the maximum limit for parameter Vcc Current (standby) ISB from 3 3 A to 5 5 A on page 11. <br> Added Revision History and About Intersil sections. <br> Updated POD to latest revision changes are as follows: <br> Updated drawing to remove table and added land pattern. |

## About Intersil

Intersil Corporation is a leading provider of innovative power management and precision analog solutions. The company's products address some of the largest markets within the industrial and infrastructure, mobile computing and high-end consumer markets. For the most updated datasheet, application notes, related documentation and related parts, please see the respective product information page found at www.intersil.com.
You may report errors or suggestions for improving this datasheet by visiting www.intersil.com/ask.
Reliability reports are also available from our website at www.intersil.com/support.
© Copyright Intersil Americas LLC 2005-2016. All Rights Reserved.
All trademarks and registered trademarks are the property of their respective owners.

For additional products, see www.intersil.com/en/products.html
Intersil products are manufactured, assembled and tested utilizing IS09001 quality systems as noted
in the quality certifications found at www.intersil.com/en/support/qualandreliability.html
Intersil products are sold by description only. Intersil may modify the circuit design and/or specifications of products at any time without notice, provided that such modification does not, in Intersil's sole judgment, affect the form, fit or function of the product. Accordingly, the reader is cautioned to verify that datasheets are current before placing orders. Information furnished by Intersil is believed to be accurate and reliable. However, no responsibility is assumed by Intersil or its subsidiaries for its use; nor for any infringements of patents or other rights of third parties which may result from its use. No license is granted by implication or otherwise under any patent or patent rights of Intersil or its subsidiaries.

For information regarding Intersil Corporation and its products, see www.intersil.com

## Package Outline Drawing

## M14.173

14 LEAD THIN SHRINK SMALL OUTLINE PACKAGE (TSSOP)
Rev 3, 10/09

SIDE VIEW

TYPICAL RECOMMENDED LAND PATTERN

For the most recent package outline drawing, see M14.173.

DETAIL "X"

NOTES:

1. Dimension does not include mold flash, protrusions or gate burrs. Mold flash, protrusions or gate burrs shall not exceed 0.15 per side.
2. Dimension does not include interlead flash or protrusion. Interlead flash or protrusion shall not exceed 0.25 per side.
3. Dimensions are measured at datum plane $\mathbf{H}$.
4. Dimensioning and tolerancing per ASME Y14.5M-1994.
5. Dimension does not include dambar protrusion. Allowable protrusion shall be 0.80 mm total in excess of dimension at maximum material condition. Minimum space between protrusion and adjacent lead is 0.07 mm .
6. Dimension in () are for reference only.
7. Conforms to JEDEC MO-153, variation AB-1.
