## Dual Supply/Low Power/1024-Tap/2-Wire Bus Single Digitally-Controlled (XDCP ${ }^{\text {TM }}$ ) Potentiometer

Rev 5.00
April 9, 2014

The X9118 is a single digitally controlled potentiometer (XDCP) on a monolithic CMOS integrated circuit.

The digital controlled potentiometer is implemented using 1023 resistive elements in a series array. Between each element are tap points connected to the wiper terminal through switches. The position of the wiper on the array is controlled by the user through the 2-wire bus interface. The potentiometer has associated with it a volatile Wiper Counter Register (WCR) and a four non-volatile Data Registers that can be directly written to and read by the user. The contents of the WCR controls the position of the wiper on the resistor array though the switches. Power-up recalls the contents of the default data register (DRO) to the WCR.

The XDCP can be used as a three-terminal potentiometer or as a two terminal variable resistors in a wide variety of applications including control, parameter adjustments, and signal processing.

## Features

- 1024 resistor taps - 10-bit resolution
- 2-wire serial interface for write, read and transfer operations of the potentiometer
- Wiper resistance, $40 \Omega$ typical @ 5 V
- Four non-volatile data registers for each potentiometer
- Non-volatile storage of multiple wiper positions
- Power on recall: Loads saved wiper position on power-up
- Standby current $<15 \mu \mathrm{~A}$ Max
- System $\mathrm{V}_{\mathrm{CC}}: 2.7 \mathrm{~V}$ to 5.5 V operation
- Analog $\mathrm{V}+/ \mathrm{V}-:-5 \mathrm{~V}$ to +5 V
- $100 \mathrm{k} \Omega$ end-to-end resistance
- Endurance: 100,000 data changes per bit per register
- 100 years data retention
- 14 Ld TSSOP
- Low power CMOS
- Pb-free (RoHS compliant)

NOTES:

1. These Intersil Pb-free plastic packaged products employ special Pb -free material sets, molding compounds/die attach materials, and $100 \%$ matte tin plate plus anneal (e3 termination finish, which is RoHS compliant and compatible with both SnPb and Pb -free soldering operations). Intersil Pb -free products are MSL classified at Pb -free peak reflow temperatures that meet or exceed the Pb -free requirements of IPC/JEDEC J STD020.
2. For Moisture Sensitivity Level (MSL), please see product information page for X9118. For more information on MSL, please see tech brief TB363.

## Functional Diagram

## Detailed Functional Diagram

## Circuit Level Applications

- Vary the gain of a voltage amplifier
- Provide programmable DC reference voltages for comparators and detectors
- Control the volume in audio circuits
- Trim out the offset voltage error in a voltage amplifier circuit
- Set the output voltage of a voltage regulator
- Trim the resistance in Wheatstone bridge circuits
- Control the gain, characteristic frequency and $Q$-factor in filter circuits
- Set the scale factor and zero point in sensor signal conditioning circuits
- Vary the frequency and duty cycle of timer ICs
- Vary the DC biasing of a pin diode attenuator in RF circuits
- Provide a control variable (I, V, or R) in feedback circuits

## System Level Applications

- Adjust the contrast in LCD displays
- Control the power level of LED transmitters in communication systems
- Set and regulate the DC biasing point in an RF power amplifier in wireless systems
- Control the gain in audio and home entertainment systems
- Provide the variable DC bias for tuners in RF wireless systems
- Set the operating points in temperature control systems
- Control the operating point for sensors in industrial systems
- Trim offset and gain errors in artificial intelligent systems

## Pin Descriptions

## Bus Interface Pins

## SERIAL DATA INPUT/OUTPUT (SDA)

The SDA is a bi-directional serial data input/output pin for a 2-wire slave device and is used to transfer data into and out of the device. It receives device address, opcode, wiper register address and data sent from a 2-wire master at the rising edge of the serial clock SCL, and it shifts out data after each falling edge of the serial clock SCL.

It is an open drain output and may be wire-ORed with any number of open drain or open collector outputs. An open drain output requires the use of a pull-up resistor. The user must account for the capacitance on the bus line and the desired rise and fall times when selecting a pull-up resistor. $2 \mathrm{k} \Omega$ to $2.5 \mathrm{k} \Omega$ are typical values when using the maximum clock frequency.

## SERIAL CLOCK (SCL)

This input is used by 2-wire master to supply 2-wire serial clock to the X9118.

## DEVICE ADDRESS (A1-A0)

The address inputs are used to set the least significant 2 bits of the 8 -bit slave address. A match in the slave address serial data stream must be made with the Address input, in order to initiate communication with the X9118. A maximum of 4 XDCP devices may occupy the 2-wire serial bus.

HARDWARE WRITE PROTECT INPUT ( $\overline{\mathrm{WP}}$ )
The $\overline{\mathrm{WP}}$ pin when LOW prevents nonvolatile writes to the Data Registers.

## Potentiometer Pins

$\mathbf{R}_{\mathrm{H}}, \mathbf{R}_{\mathrm{L}}$
The $R_{H}$ and $R_{L}$ pins are equivalent to the terminal connections on a mechanical potentiometer.

## Rw

The wiper pin is equivalent to the wiper terminal of a mechanical potentiometer.

## Bias Supply Pins

## SYSTEM SUPPLY VOLTAGE ( $\mathrm{V}_{\mathrm{CC}}$ ) AND SUPPLY GROUND

 (Vss)The $\mathrm{V}_{\mathrm{CC}}$ pin is the system or digital supply voltage. The $\mathrm{V}_{\mathrm{SS}}$ pin is the system ground.

## ANALOG SUPPLY VOLTAGES (V+ AND V-)

These supplies are the analog voltage supplies for the potentiometer. The V+ supply is tied to the wiper switches while the $V$ - supply is used to bias switches and the internal $P+$ substrate of the integrated circuit. Both of these supplies set the voltage limits of the potentiometer.

## Other Pins

## NO CONNECT

No connect pins should be left open. These pins are used for Intersil manufacturing and testing purposes.

## Principles of Operation

The X9118 is an integrated microcircuit incorporating a resistor array and its registers and counters and the serial interface logic providing direct communication between the host and the digitally controlled potentiometer. This section provides a detailed description of the following:

- Resistor Array Description
- Serial Interface Description
- Instruction and Register Description

FIGURE 1. DETAILED POTENTIOMETER BLOCK DIAGRAM

## Resistor Array Description

The X9118 is comprised of a resistor array. The array contains 1023, in effect, discrete resistive segments that are connected in series (see Figure 1). The physical ends of each array are equivalent to the fixed terminals of a mechanical potentiometer ( $R_{H}$ and $R_{L}$ inputs).

At both ends of each array and between each resistor segment is a CMOS switch (transmission gate) connected to the wiper ( $\mathrm{R}_{\mathrm{W}}$ ) output. Within each individual array only one switch may be turned on at a time. These switches are controlled by the wiper counter register (WCR). The 10 bits of the WCR (WCR[9:0]) are decoded to select, and enable, one of 1024 switches.

The WCR may be written directly. The Data Registers and the WCR can be read and written by the host system.

## Serial Interface Description

## SERIAL INTERFACE - 2-WIRE

The X9118 supports a bi-directional bus oriented protocol. The protocol defines any device that sends data onto the bus as a transmitter and the receiving device as the receiver. The device controlling the transfer is a master and the device being controlled is the slave. The master will always initiate data transfers and provide the clock for both transmit and receive operations. Therefore, the X9118 will be considered a slave device in all applications.

## CLOCK AND DATA CONVENTIONS

Data states on the SDA line can change only during SCL LOW periods. The SDA state changes during SCL HIGH are reserved for indicating start and stop conditions,
see Figure 3.

## START CONDITION

All commands to the X9118 are preceded by the start condition, which is a HIGH-to-LOW transition of SDA while SCL is HIGH. The X9118 continuously monitors the SDA and SCL lines for the start condition and will not respond to any command until this condition is met, see Figure 3.

## STOP CONDITION

All communications must be terminated by a stop condition, which is a LOW-to-HIGH transition of SDA while SCL is HIGH, see Figure 3.

## ACKNOWLEDGE

Acknowledge is a software convention used to provide a positive handshake between the master and slave devices on the bus to indicate the successful receipt of data. The transmitting device, either the master or the slave, will release the SDA bus after transmitting 8 bits. The master generates a ninth clock cycle and during this period the receiver pulls the SDA line LOW to acknowledge that it successfully received the eight bits of data.

The X9118 will respond with an acknowledge after recognition of a start condition and its slave address and once again after successful receipt of the command byte. If the command is followed by a data byte, the X9118 will respond with a final acknowledge, see Figure 2.

FIGURE 2. ACKNOWLEDGE RESPONSE FROM RECEIVER

## ACKNOWLEDGE POLLING

The disabling of the inputs during the internal nonvolatile write operation, can be used to take advantage of the typical 5 ms EEPROM write cycle time. Once the stop condition is issued to indicate the end of the nonvolatile write command the X9118 initiates the internal write cycle. The ACK polling, Flow 1, can be initiated immediately. This involves issuing the start condition followed by the device slave address. If the X9118 is still busy with the write operation no ACK will be returned. If the X9118 has completed the write operation an ACK will be returned and the master can then proceed with the next operation.

Flow 1. ACK Polling Sequence

## INSTRUCTION AND REGISTER DESCRIPTION

Device Addressing: Identification Byte (ID and A)
Following a start condition, the master must output the address of the slave it is accessing. The most significant 4 bits of the slave address are the device type identifier. The ID[3:0] bits is the device ID for the X9118; this is fixed as $0101[B]$ (refer to Table 1 on page 6).

The $A[1: 0]$ bits in the ID byte are the internal slave address. The physical device address is defined by the state of the A1A0 input pins. The slave address is externally specified by the user. The X9118 compares the serial data stream with the address input state; a successful compare of both address bits is required for the X9118 to successfully continue the command sequence. Only the device which slave address matches the incoming device address sent by the master executes the instruction. The A1 to A0 inputs can be actively driven by CMOS input signals or tied to $\mathrm{V}_{\mathrm{CC}}$ or $\mathrm{V}_{\mathrm{SS}}$. The $\mathrm{R} / \overline{\mathrm{W}}$ bit is the LSB and used to set the device for read or write operations.

## INSTRUCTION BYTE AND REGISTER SELECTION

The next byte sent to the X9118 contains the instruction and register pointer information. The three most significant bits are used to provide the instruction opcode (I[2:0]). The RB and RA bits point to one of the four registers. The format is shown in Table 2.

Table 3 provides a complete summary of the instruction set opcodes.

TABLE 1. IDENTIFICATION BYTE FORMAT

## Instruction and Register Description

## Device Addressing

## WIPER COUNTER REGISTER (WCR)

The X9118 contains a Wiper Counter Register (see Table 4) for the XDCP potentiometer. The WCR is equivalent to a serial-in, parallel-out register/counter with its outputs decoded to select one of 1024 switches along its resistor array. The contents of the WCR can be altered in one of three ways:

1. It may be written directly by the host via the write Wiper Counter Register instruction (serial load).
2. It may be written indirectly by transferring the contents of one of four associated Data Registers via the XFR Data register.
3. It is loaded with the contents of its Data Register zero (R0) upon power-up.
The Wiper Counter Register is a volatile register; that is, contents are lost when the X9118 is powered down. Although the register is automatically loaded with the value in DR0 upon power-up, this may be different from the value present at powerdown. Power-up guidelines are recommended to ensure proper loadings of the DRO value into the WCR.

## DATA REGISTERS (DR)

The potentiometer has four 10-bit non-volatile Data Registers. These can be read or written directly by the host. Data can be transferred between any of the four data registers and the Wiper Counter Register. All operations changing data in one of the Data Registers is a nonvolatile operation and will take a maximum of 10 ms .

If the application does not require storage of multiple settings for the potentiometer, the Data Registers can be used as regular memory locations for system parameters or user preference data.
Bit 9 to Bit 0 are used to store one of the 1024 wiper position ( 0 ~1023).

Four of the six instructions are four bytes in length. These instructions are:

- Read Wiper Counter Register - Read the current wiper position of the potentiometer.
- Write Wiper Counter Register - Change current wiper position of the potentiometer.
- Read Data Register - Read the contents of the selected Data Register.
- Write Data Register - Write a new value to the selected Data Register.
The basic sequence of the four byte instructions is illustrated in Figure 3. These four-byte instructions exchange data between the WCR and one of the Data Registers. A transfer from a data register to a WCR is essentially a write to a static RAM, with the static RAM controlling the wiper position. The response of the wiper to this action will be delayed by $t_{W R L}$. A transfer from the WCR (current wiper position), to a data register is a write to nonvolatile memory and takes a minimum of $t_{W R}$ to complete. The transfer can occur between the potentiometer and one of its associated registers.

Two instructions (see Figure 4) require a two-byte sequence to complete. These instructions transfer data between the host and the X9118; either between the host and one of the Data Registers or directly between the host and the Wiper Counter Register. These instructions are:

- XFR Data Register to Wiper Counter Register - This transfers the contents of one specified Data Register to the Wiper Counter Register.
- XFR Wiper Counter Register to Data Register -This transfers the contents of the specified Wiper Counter Register to the specified Data Register.

Refer to "Instruction Format" on page 8 for more details.

## Other

## POWER-UP AND POWER-DOWN REQUIREMENTS

At all times, the $V+$ voltage must be greater than or equal to the voltage at $R_{H}$ or $R_{L}$, and the voltage at $R_{H}$ or $R_{L}$ must be greater than or equal to the voltage at V -. During power-up and power-down, $\mathrm{V}_{\mathrm{CC}}, \mathrm{V}+$, and V - must reach their final values within 1 ms of each other.

## Recommended Operating Conditions

Commercial . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . $0^{\circ} \mathrm{C}$ to $+70^{\circ} \mathrm{C}$
Industrial . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$
Power Rating (each pot) . . . . . . . . . . . . . . . . . . . . . . . . . . . . . 50mW
Wiper current (max) . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . $\pm 3 m A$

CAUTION: Do not operate at or near the maximum ratings listed for extended periods of time. Exposure to such conditions may adversely impact product reliability and result in failures not covered by warranty.

NOTES:
3. $\theta_{\mathrm{JA}}$ is measured with the component mounted on a high effective thermal conductivity test board in free air. See Tech Brief TB379 for details.
4. For $\theta_{\mathrm{JC}}$, the "case temp" location is taken at the package top center.

Analog Specifications $\quad \mathrm{T}_{\mathrm{A}}=+25^{\circ} \mathrm{C}$, unless otherwise noted. Boldface limits apply across the operating temperature range, $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$.

| SYMBOL | PARAMETER | TEST CONDITIONS | MIN (Note 10) | TYP | MAX <br> (Note 10) | UNITS |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathrm{R}_{\text {TOTAL }}$ | End to End Resistance |  |  | 100 |  | $\mathrm{k} \Omega$ |
|  | End to End Resistance Tolerance |  |  |  | $\pm 20$ | \% |
| $\mathrm{R}_{\mathrm{W}}$ | Wiper Resistance | $\mathrm{I}_{\mathrm{W}}=\left(\mathrm{V}_{\mathrm{RH}}-\mathrm{V}_{\mathrm{RL}}\right) / \mathrm{R}_{\text {TOTAL }}, \mathrm{V}_{\mathrm{CC}}=3 \mathrm{~V}, \mathrm{~V}_{\mathrm{RL}}=-3 \mathrm{~V}$ |  | 150 | 500 | $\Omega$ |

| Vv- | Voltage on V- Pin | X9118 | -5.5 |  | -4.5 | V |
|  |  | X9118-2.7 | -5.5 |  | -2.7 | V |
| $\mathrm{V}_{\text {TERM }}$ | Voltage on any $\mathrm{R}_{\mathrm{H}}$ or $\mathrm{R}_{\mathrm{L}}$ Pin | $\mathrm{V}_{\text {SS }}=0 \mathrm{~V}$ | v- |  | V+ | V |
|  | Noise | Ref: 1kHz |  | -120 |  | dBV |
|  | Resolution |  |  | 0.1 |  | \% |
|  | Absolute Linearity (Note 5) | $\begin{aligned} & R_{w(n)(\text { actual })}-R_{w(n) \text { (expected) }} \text {, where } n=1 \text { to } \\ & 1023 \end{aligned}$ |  |  | $\pm 1.5$ | $\begin{array}{\|c} \text { MI } \\ \text { (Note 7) } \end{array}$ |
|  | Relative Linearity (Note 6) | $R_{w(m+1)}-\left[R_{w(m)}+M I\right]$, where $m=1$ to 1023 |  |  | $\pm 1.5$ | $\begin{array}{\|c\|} \hline \mathrm{MI} \\ \text { (Note 7) } \end{array}$ |
|  | Temperature Coefficient of $\mathrm{R}_{\text {TOTAL }}$ |  |  | $\pm 300$ |  | $\mathrm{ppm} /{ }^{\circ} \mathrm{C}$ |
|  | Ratiometric Temperature Coefficient | Wiper at middle point |  | $\pm 20$ |  | $\mathrm{ppm} /{ }^{\circ} \mathrm{C}$ |
| $\mathrm{C}_{\mathrm{H}} / \mathrm{C}_{\mathrm{L}} / \mathrm{C}_{\mathrm{W}}$ | Potentiometer Capacitances | See Macro model |  | $\begin{gathered} 10 / 10 \\ / 25 \end{gathered}$ |  | pF |

## NOTES:

5. Absolute linearity is utilized to determine actual wiper voltage versus expected voltage as determined by wiper position when used as a potentiometer.
6. Relative linearity is utilized to determine the actual change in voltage between two successive tap positions when used as a potentiometer. It is a measure of the error in step size.
7. $\mathrm{MI}=\mathrm{R}_{\mathrm{TOT}} / 1023$ or $\left(\mathrm{R}_{\mathrm{H}}-\mathrm{R}_{\mathrm{L}}\right) / 1023$, single pot.
8. $\mathrm{V}_{\mathrm{CC}}, \mathrm{V}+, \mathrm{V}$ - must reach their final values within 1 ms of each other.
9. $n=0,1,2, \ldots, 1023 ; m=0,1,2, \ldots, 1022$.

DC Operating Specifications $\mathrm{T}_{\mathrm{A}}=+25^{\circ} \mathrm{C}$, unless otherwise noted. Boldface limits apply across the operating temperature range , $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$.

| VoL | Output LOW Voltage | $\mathrm{IOL}=3 \mathrm{~mA}$ |  |  | 0.4 | V |

NOTE:
10. Parameters with MIN and/or MAX limits are $100 \%$ tested at $+25^{\circ} \mathrm{C}$, unless otherwise specified. Temperature limits established by characterization and are not production tested.

## Endurance and Data Retention

| PARAMETER | MIN | UNITS |
| :---: | :---: | :---: |
| Minimum Endurance | 100,000 | Data changes per bit per register |
| Data Retention | 100 | years |

## Capacitance

| SYMBOL | TEST | TYP | UNITS | TEST CONDITIONS |
| :---: | :--- | :---: | :---: | :---: |
| CIN/OUT <br> (Note 11) | Input/Output Capacitance (SI) | 8 | pF | $\mathrm{V}_{\text {OUT }}=0 \mathrm{~V}$ |
| $\mathrm{C}_{\text {IN }}$ (Note 11) | Input Capacitance (SCL, $\overline{\mathrm{WP}, \mathrm{A} 1 \text { and A0) }}$ | 6 | pF | $\mathrm{V}_{\text {IN }}=0 \mathrm{~V}$ |

## Power-Up Timing

| SYMBOL | PARAMETER | MIN | MAX |
| :---: | :--- | :---: | :---: |
| $t_{r} V_{\text {CC }}$ (Note 11) | $V_{\text {CC }}$ Power-up Rate | 0.2 | 50 |
| $t_{\text {PUR }}$ (Note 12) | Power-up to Initiation of Read Operation |  | 1 |
| $t_{\text {PUW }}$ (Note 12) | Power-up to Initiation of Write Operation |  | $5 / \mathrm{ms}$ |

## NOTES:

11. This parameter is not $100 \%$ tested.
12. $t_{P U R}$ and $t_{\text {PUW }}$ are the delays required from the time the (last) power supply $\left(\mathrm{V}_{\mathrm{CC}}\right)$ is stable until the specific instruction can be issued. These parameters are periodically sampled and not $100 \%$ tested.

## AC Test Conditions

| Input Pulse Levels | $\mathrm{V}_{\mathrm{CC}} \times 0.1$ to $\mathrm{V}_{\mathrm{CC}} \times 0.9$ |
| :--- | :---: |
| Input Rise and Fall Times | 10 ns |
| Input and Output Timing Level | $\mathrm{V}_{\mathrm{CC}} \times 0.5$ |

## Equivalent A.C. Load Circuit

SPICE MACROMODEL

## AC Timing High-Voltage Write Cycle Timing

| SYMBOL | PARAMETER | MIN | MAX | UNITS |
| :---: | :---: | :---: | :---: | :---: |
| $\mathrm{f}_{\text {SCL }}$ | Clock Frequency |  | 400 | kHz |
| $\mathrm{t}_{\mathrm{CYC}}$ | Clock Cycle Time | 2500 |  | ns |
| $\mathrm{t}_{\mathrm{HIGH}}$ | Clock High-Time | 600 |  | ns |
| tLOW | Clock Low-Time | 1300 |  | ns |
| tSU:STA | Start Setup Time | 600 |  | ns |

## Package Outline Drawing

## M14.173

14 LEAD THIN SHRINK SMALL OUTLINE PACKAGE (TSSOP) Rev 3, 10/09

SIDE VIEW

TYPICAL RECOMMENDED LAND PATTERN

NOTES:

1. Dimension does not include mold flash, protrusions or gate burrs. Mold flash, protrusions or gate burrs shall not exceed 0.15 per side.
2. Dimension does not include interlead flash or protrusion. Interlead flash or protrusion shall not exceed 0.25 per side.
3. Dimensions are measured at datum plane $\mathbf{H}$.
4. Dimensioning and tolerancing per ASME Y14.5M-1994.
5. Dimension does not include dambar protrusion. Allowable protrusion shall be 0.80 mm total in excess of dimension at maximum material condition. Minimum space between protrusion and adjacent lead is 0.07 mm .
6. Dimension in () are for reference only.
7. Conforms to JEDEC MO-153, variation AB-1.
