

## Triple Channel PWM Controller with Integrated Driver for IMVP8 Mobile CPU Core Power Supply

### General Description

The RT3601BC is an IMVP8 compliant CPU power controller which includes three voltage rails : a single phase synchronous Buck controller, the main VR, a 2/1 phase synchronous Buck controller, the auxiliary VR, and a single phase synchronous Buck controller, the VCCSA VR. The RT3601BC adopts G-NAVP™ (Green Native AVP) which is Richtek's proprietary topology derived from finite DC gain of EA amplifier with current mode control, making it easy to set the droop to meet all Intel CPU requirements of AVP (Adaptive Voltage Positioning). Based on the G-NAVP™ topology, the RT3601BC also features a quick response mechanism for optimized AVP performance during load transient. The RT3601BC supports mode transition function with various operating states. A serial VID (SVID) interface is built in the RT3601BC to communicate with Intel IMVP8 compliant CPU. The RT3601BC supports VID on-the-fly function with three different slew rates : Fast, Slow and Decay. By utilizing the G-NAVP™ topology, the operating frequency of the RT3601BC varies with VID, load and input voltage to further enhance the efficiency even in CCM. Moreover, the G-NAVP™ with CCRCOT (Constant Current Ripple COT) technology provides superior output voltage ripple over the entire input/output range. The built-in high accuracy DAC converts the SVID code ranging from 0.25V to 1.52V with 5mV per step. The RT3601BC integrates a high accuracy ADC for platform setting functions, such as quick response trigger level. Besides, the setting function also supposes this two rails address exchange. The RT3601BC provides VR ready output signals. It also features complete fault protection functions including over-voltage (OV), negative voltage (NV), over-current (OC) and under-voltage lockout (UVLO). The RT3601BC is available in the WQFN-52L 6x6 small foot print package.

### Features

- Intel IMVP8 Serial VID Interface Compatible Power Management States
- Single Phase (Main VR) + 2/1 Phase (Auxiliary VR) + Single Phase (VCCSA VR) PWM Controller
- 1 Embedded MOSFET Driver at the Main VR, 1 Embedded MOSFET Driver at the Auxiliary VR, and Embedded MOSFET Driver at the VCCSA VR
- G-NAVP™ (Green Native Adaptive Voltage Positioning) Topology
- 0.5% DAC Accuracy
- Differential Remote Voltage Sensing
- Built-in ADC for Platform Programming
- Accurate Current Balance
- System Thermal Compensated AVP
- Diode Emulation Mode at Light Load Condition for Multiple or Single Phase Operation
- Fast Transient Response
- VR Ready Indicator
- Thermal Throttling
- Current Monitor Output
- OVP, OCP, NVP, UVLO
- Slew Rate Setting/Address Flip Function
- DVID Enhancement

### Applications

- IMVP8 Intel Core Supply
- Notebook/ Desktop Computer/ Servers Multi-phase CPU Core Supply
- AVP Step-Down Converter

### Simplified Application Circuit

## Ordering Information

- RT3601BC □ □
- Package Type  
QW : WQFN-52L 6x6 (W-Type)
  - Lead Plating System  
G : Green (Halogen Free and Pb Free)  
Z : ECO (Ecological Element with Halogen Free and Pb free)

Note :

Richtek products are :

- ▶ RoHS compliant and compatible with the current requirements of IPC/JEDEC J-STD-020.
- ▶ Suitable for use in SnPb or Pb-free soldering processes.

## Marking Information

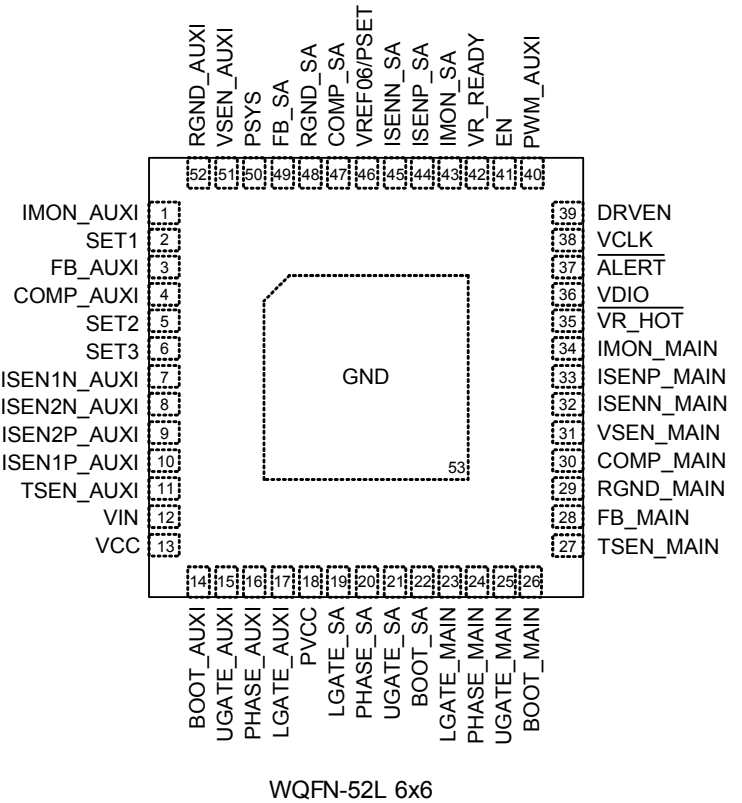

RT3601BCZQW : Product Number  
YMDNN : Date Code

RT3601BCGQW : Product Number  
YMDNN : Date Code

## Pin Configuration

(TOP VIEW)

## Functional Pin Description

Pin No	Pin Name	Pin Function
1	IMON_AUXI	Auxiliary rail VR current monitor output. This pin outputs a voltage proportional to the output current.
2	SET1	Platform setting. Platform can use this pin to set switching frequency, ki gain, QRTH and QR width and for Main VR. Connect the SET1 pin to 5V and turn-on the EN pin, if the soldering is good, VSEN_MAIN = VSEN_AUXI = 0.8V and VSEN_SA = 1V
3	FB_AUXI	Negative input of the error amplifier. This pin is for Auxiliary rail VR output voltage feedback to controller.
4	COMP_AUXI	Auxiliary rail VR compensation. This pin is error amplifier output pin.
5	SET2	Platform setting. Platform can use this pin to set switching frequency, ki gain, QRTH and QR width for Auxiliary VR.
6	SET3	Platform setting. Platform can use this pin to set switching frequency, ki gain zero load-line, QRTH and QR width for VCCSA rail. And it can be set Enable/Disable anti-overshoot function for each rail.
7, 8	ISEN[1:2]N_AUXI	Negative current sense inputs of multi-phase auxiliary rail VR Channel 1 and 2.
10, 9	ISEN[1:2]P_AUXI	Positive current sense inputs of multi-phase auxiliary rail VR Channel 1 and 2.
11	TSEN_AUXI	Thermal sense input for VR.

Pin No	Pin Name	Pin Function
12	VIN	VIN input pin. Connect a low pass filter to this pin to set on-time.
13	VCC	Controller power supply. Connect this pin to 5V and place a decoupling capacitor 2.2 $\mu$ F at least. The decoupling capacitor is as close PWM controller as possible.
14	BOOT_AUXI	Bootstrap supply for high-side gate MOSFET driver for auxiliary rail VR.
15	UGATE_AUXI	High-side driver output for auxiliary rail VR. Connect the pin to the gate of high-side MOSFET.
16	PHASE_AUXI	Switch node of high-side driver for auxiliary rail VR. Connect the pin to high-side MOSFE source together with the low-side MOSFET drain and inductor.
17	LGATE_AUXI	Low-side driver output for auxiliary rail VR. This pin drives the gate of low-side MOSFET.
18	PVCC	Driver power supply input. Connect this pin to GND by a minimum 2.2 $\mu$ F ceramic Capacitor.
19	LGATE_SA	Low-side driver output for VCCSA VR. This pin drives the gate of low-side MOSFET.
20	PHASE_SA	Switch node of high-side driver for VCCSA VR. Connect the pin to high-side MOSFE source together with the low-side MOSFET drain and inductor.
21	UGATE_SA	High-side driver output for VCCSA VR. Connect the pin to the gate of high-side MOSFET.
22	BOOT_SA	Bootstrap supply for high-side gate MOSFET driver for VCCSA VR.
23	LGATE_MAIN	Low-side driver output for main rail VR. This pin drives the gate of low-side MOSFET.
24	PHASE_MAIN	Switch node of high-side driver for main rail VR. Connect the pin to high-side MOSFE source together with the low-side MOSFET drain and inductor.
25	UGATE_MAIN	High-side driver output for main rail VR. Connect the pin to the gate of high-side MOSFET.
26	BOOT_MAIN	Bootstrap supply for high-side gate MOSFET driver for main rail VR.
27	TSEN_MAIN	Thermal sense input for main rail VR.
28	FB_MAIN	Negative input of the error amplifier. This pin is for main rail VR output voltage feedback to controller.
29	RGND_MAIN	Return ground for main rail VR. This pin is the negative node of the differential remote voltage sensing.
30	COMP_MAIN	Main rail VR compensation. This pin is error amplifier output pin.
31	VSEN_MAIN	Main VR voltage sense input. This pin is connected to the terminal of Main VR output voltage.
32	ISENN_MAIN	Negative current sense input of single-phase main rail.
33	ISENP_MAIN	Positive current sense input of single-phase main rail.
34	IMON_MAIN	Main rail VR current monitor output. This pin outputs a voltage proportional to the output current.
35	$\overline{\text{VR\_HOT}}$	Thermal monitor output, this pin is active low.
36	VDIO	VR and CPU data transmission interface.
37	$\overline{\text{ALERT}}$	SVID alert. (Active low)

Pin No	Pin Name	Pin Function
38	VCLK	Synchronous clock from the CPU.
39	DRVEN	External driver enable control. Connecting to driver enable pin.
40	PWM_AUXI	PWM outputs for auxiliary VR.
41	EN	VR enable control input.
42	VR_READY	VR ready indicator.
43	IMON_SA	VCCSA rail VR current monitor output. This pin outputs a voltage proportional to the output current.
44	ISENP_SA	Positive current sense input of single-phase VCCSA rail VR.
45	ISENN_SA	Negative current sense input of single-phase VCCSA rail VR.
46	VREF06/PSET	Fixed 0.6V output reference voltage. This voltage is used to offset the output voltage of IMON pin. Between this pin and GND must be placed an exact 0.47 $\mu$ F decoupling capacitor and 1 $\Omega$ resistor.
47	COMP_SA	VCCSA rail VR compensation. This pin is error amplifier output pin.
48	RGND_SA	Return ground for VCCSA rail VR. This pin is the negative node of the differential remote voltage sensing.
49	FB_SA	Negative input of the error amplifier. This pin is for VCCSA rail VR output voltage feedback to controller.
50	PSYS	System input power monitor. Place the PSYS resistor as close to the IC as possible.
51	VSEN_AUXI	Auxiliary VR voltage sense input. This pin is connected to the terminal of auxiliary VR output voltage.
52	RGND_AUXI	Return ground for auxiliary rail VR. This pin is the negative node of the differential remote voltage sensing.
53 (Exposed Pad)	GND	Ground. The exposed pad must be soldered to a large PCB and connected to GND for maximum power dissipation.

**Functional Block Diagram**

## Operation

The RT3601BC adopts G-NAVP™ (Green Native AVP) which is Richtek's proprietary topology derived from finite DC gain of EA amplifier with current mode control, making it easy to set the droop to meet all Intel CPU requirements of AVP (Adaptive Voltage Positioning).

The G-NAVP™ controller is one type of current mode constant on-time control with DC offset cancellation. The approach can not only improve DC offset problem for increasing system accuracy but also provide fast transient response. When current feedback signal reaches COMP signal, the RT3601BC generates an on-time width to achieve PWM modulation.

### TON GEN/Driver Interface PWMx

Generate the sequentially according to the phase control signal from the Loop Control/Protection Logic. Pulse width is determined by current balance result and pin setting. Once quick response mechanism is triggered, VR will allow all PWM to turn on at the same time. PWM status is also controlled by Protection Logic. Different protections may cause different PWM status (Both High-Z or LG turn-on).

### SVID Interface/Configuration Registers/Control Logic

The interface receives the SVID signal from CPU and sends the relative signals to Loop Control/Protection Logic for loop control to execute the action by CPU. The registers save the pin setting data from ADC output. The Control Logic controls the ADC timing, generates the digital code of the VID for VSEN voltage.

### Loop Control/Protection Logic

It controls the power on sequence, the protection behavior, and the operational phase number.

### MUX and ADC

The MUX supports the inputs from SET1, SET2, SET3, IMON\_MAIN, IMON\_AUXI, TSEN\_MAIN and TSEN\_AUXI. The ADC converts these analog signals to digital codes for reporting or performance adjustment.

### Current Balance

Each phase current sense signal is sent to the current balance circuit which adjusts the on-time of each phase to optimize current sharing.

### Offset Cancellation

Cancel the current/voltage ripple issue to get the accurate VSEN.

### UVLO

Detect the VCC voltage and issue POR signal as they are high enough.

### DAC

Generate an analog signal according to the digital code generated by Control Logic.

### Soft-Start & Slew Rate Control

Control the Dynamic VID slew rate of VSEN according to the SetVID fast or SetVID slow.

### Error Amp

Error amplifier generates COMP\_MAIN/COMP\_AUXI/COMP\_SA signal by the difference between output of Main/Auxiliary/SA rail and FB\_MAIN/FB\_AUXI/FB\_SA.

### PWM CMP

The PWM comparator compares COMP signal and current feedback signal to generate a signal for TON trigger.

### IMON Filter

IMON Filter is used for average sum current signal by analog RC filter.

**Note 1.** Stresses beyond those listed “Absolute Maximum Ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions may affect device reliability.

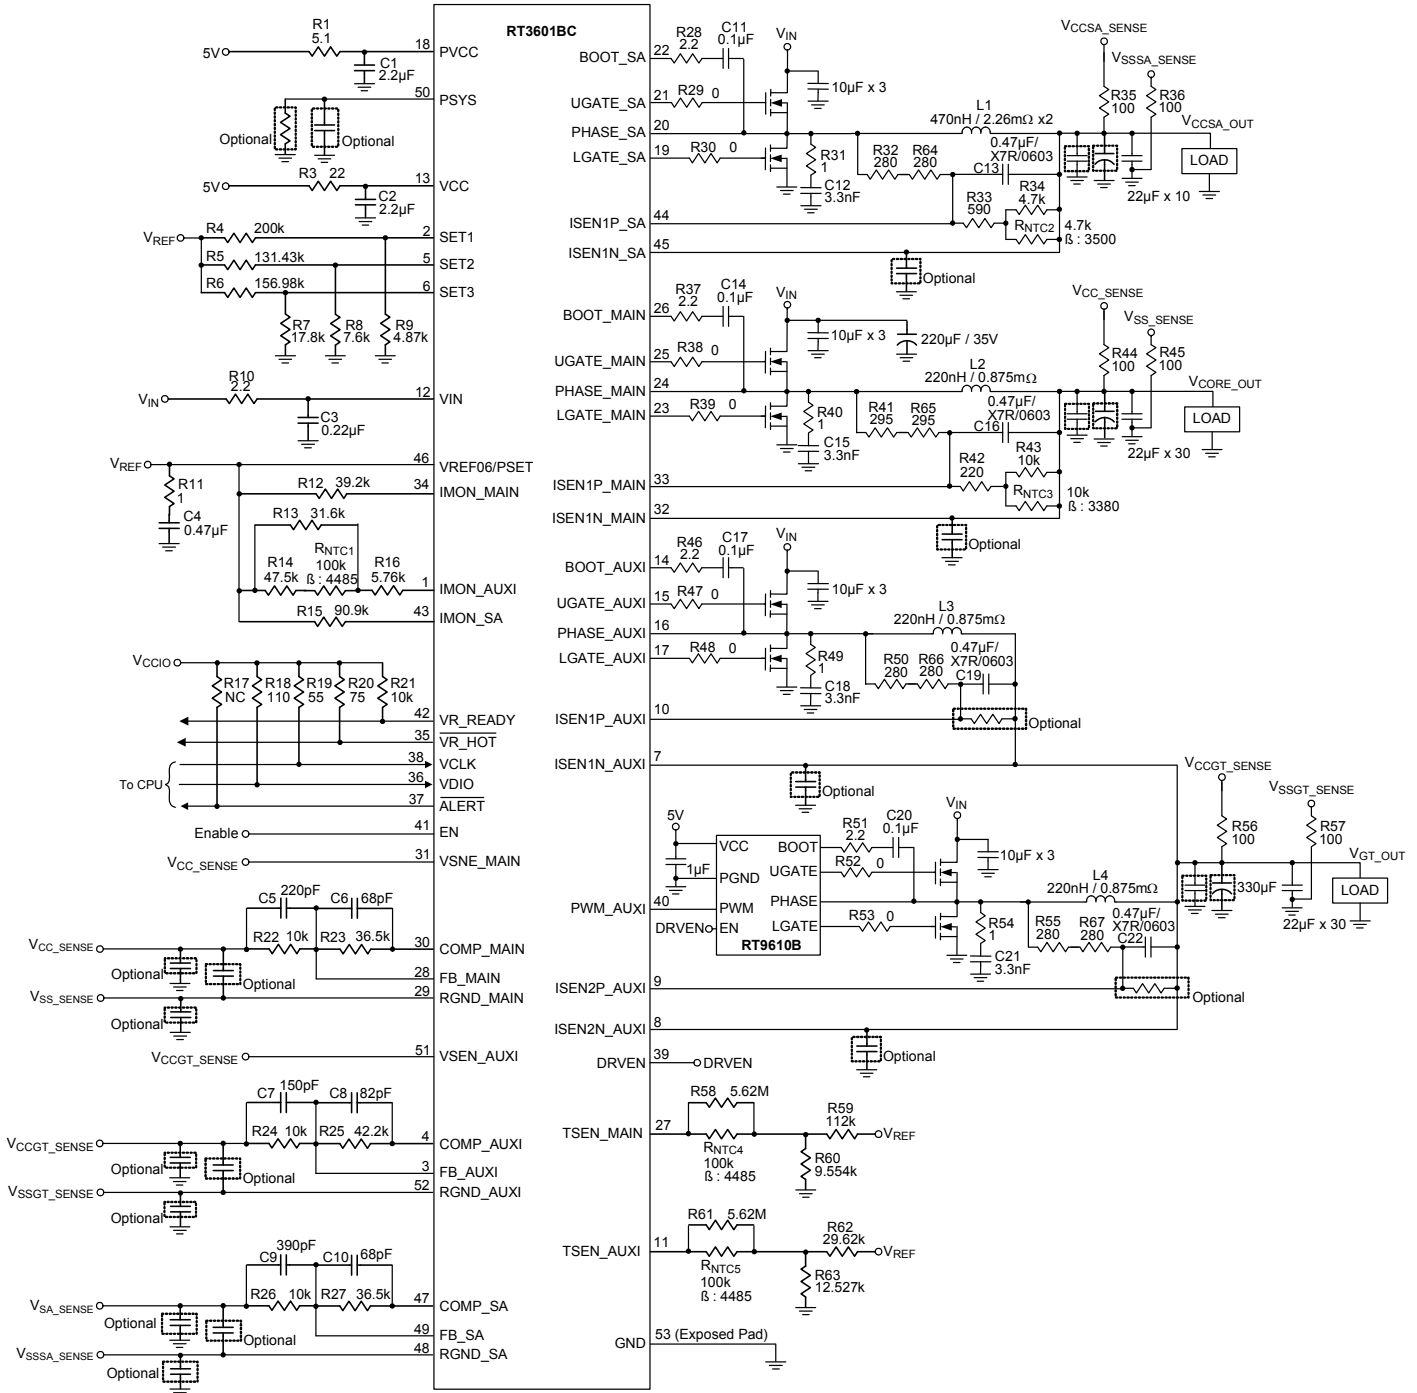

**Note 2.** θ<sub>JA</sub> is measured under natural convection (still air) at T<sub>A</sub> = 25°C with the component mounted on a high effective-thermal-conductivity four-layer test board on a JEDEC 51-7 thermal measurement standard. θ<sub>JC</sub> is measured at the exposed pad of the package.

**Note 3.** Devices are ESD sensitive. Handling precaution is recommended.

**Note 4.** The device is not guaranteed to function outside its operating conditions.

## Typical Application Circuit

For GT Two Phase Application

Note : R22 to R27, C5 to C10 customer must to tune final parameters on system board at first time.

## Applications information

The RT3601BC includes three voltage rails : a single phase synchronous Buck controller, the main VR, a 2/1 multiphase synchronous Buck controller, the auxiliary VR, and a single phase synchronous Buck controller, the VCCSA VR, designed to meet Intel IMVP8 compatible CPUs specification with a serial SVID control interface. The controller uses an ADC to implement all kinds of settings to save total pin number for easy use and increasing PCB space utilization. The RT3601BC is used in notebooks, desktop computers and servers.

### General loop Function

#### G-NAVP™ Control Mode

The RT3601BC adopts the G-NAVP™ controller, which is a current mode constant on-time control with DC offset cancellation. The approach can not only improve DC offset problem for increasing system accuracy but also provide fast transient response. When current feedback signal reaches comp signal, the RT3601BC generates an on-time width to achieve PWM modulation. Figure 1 shows the basic G-NAVP™ behavior waveforms in continuous conduct mode (CCM).

Figure 1 (a). G-NAVP™ Behavior Waveforms in CCM in Steady State

Figure 1 (b). G-NAVP™ Behavior Waveforms in CCM in Load Transient.

#### Diode Emulation Mode (DEM)

As well-known, the dominate power loss is switching related loss during light load, hence VR needs to be operated in asynchronous mode (or called discontinuous conduct mode, DCM) to reduce switching related loss since switching frequency is dependent on loading in the asynchronous mode. The RT3601BC can operate in diode emulation mode (DEM) to improve light load efficiency. In DEM operation, the behavior of low-side MOSFET(s) needs to work like a diode, that is, the low-side MOSFET(s) will be turned on when the phase voltage is a negative value, i.e. the inductor current follows from Source to Drain of low-side MOSFET(s). And the low-side MOSFET(s) will be turned off when phase voltage is a positive value, i.e. reversed current is not allowed. Figure 2 shows the control behavior in DEM. Figure 3 shows the G-NAVP™ operation in DEM to illustrate the control behaviors. When the load decreases, the discharge time of output capacitors increases during UGATE and LGATE are turned off. Hence, the switching frequency and switching loss will be reduced to improve efficiency in light load condition.

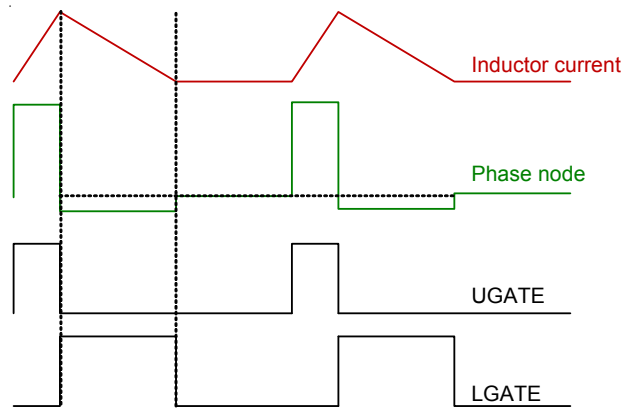

Figure 2. Diode Emulation Mode (DEM) in Steady State

Figure 3. (a)

Figure 3. (b)

Figure 3. G-NAVPTM Operation in DEM. (a) : The load is lighter, output capacitor discharge slope is smaller and the switching frequency is lower. (b) : The load is increasing, output capacitor discharge slope is increased and switching frequency is increased, too.

**Phase Interleaving Function**

The RT3601BC is a multi-output controller, the AUX1 rail of RT3601BC has a phase interleaving function, 180 degree phase shift for 2-phase operation which can help reduce output voltage ripple and EMI problem.

**Multi-Function Pin Setting Mechanism**

For reducing total pin number of package, SET [1:3], TSEN\_Main and TSEN\_AUX1 pins adopt the multi-function pin setting mechanism in the RT3601BC. Figure 4 illustrates this operating mechanism for SET [1:3]. The voltage at VREF pin will be pulled up to 3.2V after power ready (POR). First, external voltage divider is used to set the Function1, and then internal current source 80μA is used to set the Function2. The setting voltage of Function1 and Function2 can be represented as

$$V_{Function1} = \frac{R2}{R1+R2} \times 3.2V$$

$$V_{Function2} = 80\mu A \times \frac{R1 \times R2}{R1+R2}$$

All function setting will be done within 500μs after power ready (POR), and the voltage at VREF pin will be fixed to 0.6V after all function setting over.

If  $V_{Function1}$  and  $V_{Function2}$  are determined, R1 and R2 can be calculated as follows :

$$R1 = \frac{3.2V \times V_{Function2}}{80\mu A \times V_{Function1}}$$

$$R2 = \frac{R1 \times V_{Function1}}{3.2V - V_{Function1}}$$

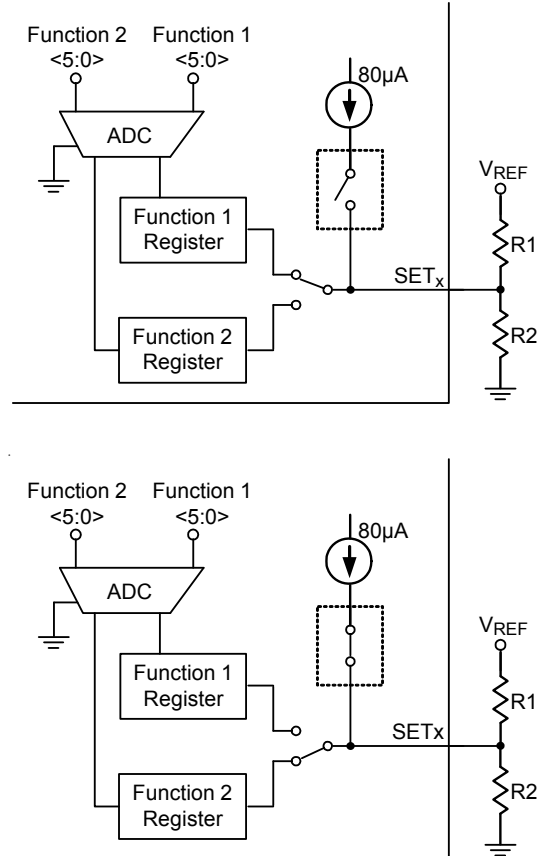

Figure 4. Multi-Function Pin Setting Mechanism for SET [1:3]

Connecting a R3 resistor from SETx pin or SETAx pin to the middle node of voltage divider can help to fine tune the set voltage of Function 2, which does not affect the set voltage of Function1. The Figure 5 shows the setting method and the set voltage of Function 1 and Function2 can be represented as :

$$V_{Function1} = \frac{R2}{R1+R2} \times 3.2V$$

$$V_{Function2} = 80\mu A \times \left( R3 + \frac{R1 \times R2}{R1+R2} \right)$$

Figure 5. Multi-Function Pin Setting Mechanism with a R3 Resistor to Fine Tune the Set Voltage of Function2

Figure 6 shows operating mechanism for TSEN\_Main and TSEN\_AUXI pins. There is only voltage divider Function to program VR. The internal current source is used to thermal sensing. The Function for program VR can be represented as

$$V_{Function1} = \frac{R2}{R1+R2} \times 3.2V$$

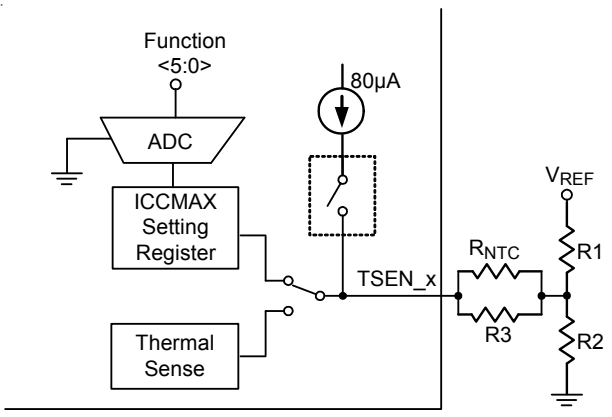

Figure 6. Multi-Function Pin Setting Mechanism for TSEN\_Main and TSEN\_AUXI

By the way, Function1 of SET1, SET2 and SET3 pins are used to program T<sub>ON</sub> factor and ki gain for each VR rail (Main, AUXI and SA). Function2 of SET1, and SET2 pins are used to program QR threshold and QR width for Main and AUXI VR rails, respectively. Function2 of SET3 pin is used to setting enable/disable anti-overshoot function and tri-state delay time for each rail. SET3 pin also can be set enable/disable zero load-line function for SA rail. TSEN\_Main and TSEN\_AUXI pins are used to setting DVID threshold and ICCMAX for each VR rail. In addition, Richtek provide a Microsoft Excel-based spreadsheet to help design SETx, TSEN\_Main and TSEN\_AUXI resistor network.

**TSEN\_Main, TSEN\_AUXI and VR\_HOT**

The VR\_HOT signal is an open-drain signal which is used for VR thermal protection. When the sensed voltage in each TSEN pin is less than 1.092, the VR\_HOT signal will be pulled-low to notify CPU that the thermal protection needs to work. According to Intel VR definition, VR\_HOT signal needs acting if VR power chain temperature exceeds 100°C. Placing an NTC thermistor at the hottest area in the VR power chain and its connection is shown in Figure 7, to design the TSEN network so that V<sub>TSEN</sub> = 1.092V at 100°C. The resistance accuracy of TSEN network is recommended to be 1% or higher.

$$V_{TSEN\_X} = 80\mu A \times [R1 // (R2 + R_{NTC}(100^\circ C))]$$

Figure 7. VR\_HOT Circuit

**Power Ready (POR) Detection**

During start-up, the RT3601BC detects the voltage at the voltage input pins : V<sub>CC</sub> and EN. When V<sub>CC</sub> > 4.45V, the RT3601BC recognizes the power state of system to be ready (POR = high) and waits for enable command at the EN pin. After POR = high and V<sub>EN</sub> > 0.7V, the RT3601BC enters start-up sequence. If V<sub>CC</sub> drops below low threshold (POR = low), the RT3601BC enters power down sequence and all functions will be disabled. Normally, connecting system voltage V<sub>TT</sub> (1.05V) to the EN pin is recommended. 2ms (max) after the chip has been enabled, the SVID circuitry will be ready. All the protection latches (OVP, OCP, UVP) will be cleared only by V<sub>CC</sub>. The condition of VEN = low will not clear these latches. Figure 8 and Figure 9 show the POR detection and the timing chart for POR process, respectively.

**Under-Voltage Lockout (UVLO)**

During normal operation, if the voltage at the VCC pin drops below POR threshold 4.14V (min), the VR triggers UVLO. The UVLO protection forces all high-side MOSFETs and low-side MOSFETs off by shutting down internal PWM logic drivers.

Figure 8. POR Detection

Figure 9. Timing Chart for POR Process

**Phase Disable (Before POR)**

The number of active phases is determined by the internal circuitry that monitors the ISENxN voltages during startup. Normally, the AUX1 rail operates as a 2-phase PWM controller. Pulling ISEN2N to VCC programs a 1-phase operation. Before POR, VR detects whether the voltage of ISEN2N is higher than “V<sub>CC</sub> – 1V” to decide how many phases should be active. Phase selection is only active during POR. When POR = high, the number of active phases is determined and latched. The unused ISENxP pins are recommended to be connected to VCC and unused PWM pins can be left floating.

**Switching Frequency Setting**

The RT3601BC is one kind of constant on-time control. The patented CCRCOT (Constant Current Ripple COT) technology can generate an adaptive on-time with input voltage and VID code to obtain a constant current ripple, so that the output voltage ripple can be controlled nearly like a constant as different input and output voltages change.

The T<sub>on</sub> equation can be classified as below two regions.

$$V_{DAC} \geq 0.9$$

$$T_{ON} = \frac{1.2\mu \times V_{DAC}}{k_{TON} \times (V_{IN} - V_{DAC})} + 15n$$

$$V_{DAC} < 0.9$$

$$T_{ON} = \frac{1.08\mu}{k_{TON} \times (V_{IN} - V_{DAC})} + 15n$$

where k<sub>TON</sub> is a coefficient which can be selected by SET[1:3] pins for each VR rail. Table 2 and Table 3 show the k<sub>TON</sub> coefficient and ki gain setting for each VR rail on the SET[1:3] pins.

Table 2. SET[1-3] Pins Setting for k<sub>TON</sub> and k<sub>i</sub> gain

For better efficiency of the given load range, the maximum switching frequency is suggested to be :

$$f_{SW(MAX)} = \frac{VID1 + \frac{I_{ccTDC}}{N} \cdot \left( DCR + \frac{R_{ON\_LS,max}}{n_{LS}} - N \cdot R_{LL} \right)}{\left[ V_{IN(MAX)} + \frac{I_{ccTDC}}{N} \left( \frac{R_{ON\_LS,max}}{n_{LS}} - \frac{R_{ON\_HS,max}}{n_{HS}} \right) \right] \cdot (T_{ON} - T_D + T_{ON,VAR}) + \frac{I_{ccTDC}}{N} \left( \frac{R_{ON\_LS,max}}{n_{LS}} \right) \cdot T_D}$$

where  $f_{SW(MAX)}$  is the maximum switching frequency, VID1 is the typical VID of application,  $V_{IN(MAX)}$  is the maximum application input voltage,  $I_{ccTDC}$  is the thermal design current of application, N is the phase number. The  $R_{ON\_HS,max}$  is the maximum equivalent high-side  $R_{DS(ON)}$ , and  $n_{HS}$  is the number of high-side MOSFETs;  $R_{ON\_LS,max}$  is the maximum equivalent low-side  $R_{DS(ON)}$ , and  $n_{LS}$  is the number of low-side MOSFETs.  $T_D$  is the summation of the high-side MOSFET delay time and the rising time,  $T_{ON,VAR}$  is the  $T_{ON}$  variation value. DCR is the inductor DCR, and  $R_{LL}$  is the loadline setting. In addition, Richtek provides a Microsoft Excel-based spreadsheet to help design the  $R_{TON}$  for the RT3601BC.

When load increases, on-time keeps constant. The off-time width will be reduced so that loading can load more power from input terminal to regulate output voltage. Hence, the loading current usually increases in case the switching frequency also increases. Higher switching frequency operation can reduce power components' size and PCB space, trading off the whole efficiency since switching related loss increases, vice versa.

**Current Sense**

In the RT3601BC, the current signal is used for load-line setting and over-current protection (OCP). The inductor current sense method adopts the lossless current sensing for allowing high efficiency as illustrated in Figure 10. If RC network time constant matches inductor time constant  $L_x/DCR_x$ , an expected load transient waveform can be designed. If  $R_x C_x$  network time constant is larger than inductor time constant  $L_x/DCR_x$ ,  $V_{CORE}$  waveform has a sluggish droop during load transient. If  $R_x C_x$  network is smaller than inductor time constant  $L_x/DCR_x$ , a worst  $V_{CORE}$  waveform will sag to create an undershooting to fail the specification.  $R_x$  is highly recommended as two 0603 size resistors in series to enhance the  $I_{OUT}$  reporting accuracy.  $C_x$  is suggested X7R type for the application.

Figure 11 shows the variety  $R_x C_x$  constant corresponding to the output waveforms.

Figure 10. Lossless Current Sense Method for Single Phase

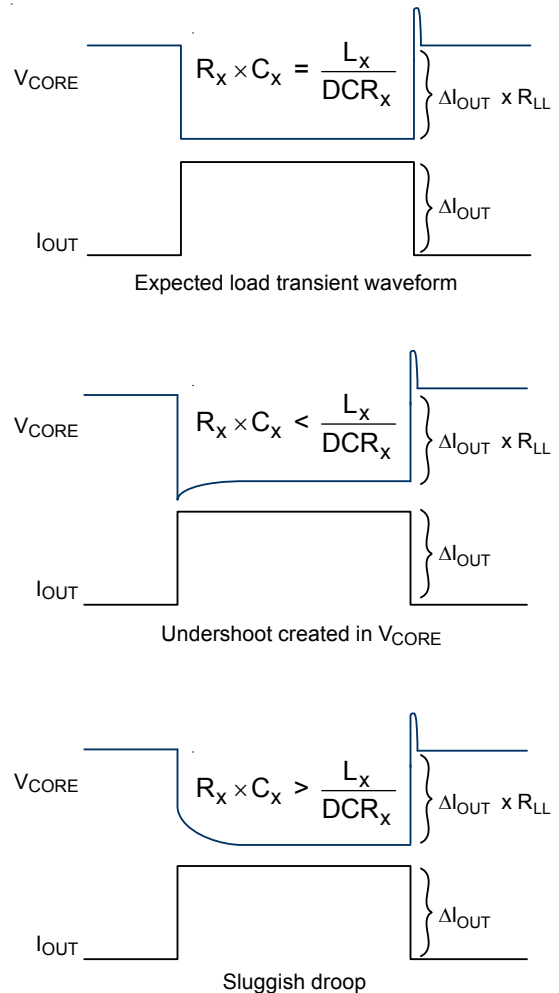

Figure 11. All Kind of  $R_x C_x$  Constants

For dual phase current sense is demonstrated as Figure 12. It is similar to single phase method and it also can be extended to N phase application. In the RT3601BC design, the resistance of  $R_{CS}$  is equal to 2.15k $\Omega$ .

Figure 12. Lossless Current Sense Method for Dual Phase

**Thermal Compensation for Current Sense**

Since the copper wire of inductor has a positive temperature coefficient. And hence, temperature compensation is necessary for the lossless inductor current sense. For single phase thermal compensation, Figure 13. shows a not only simple but also effective way to compensate temperature variation. An NTC thermistor is put in the current sensing network and it can be used to compensate DCR variation due to temperature is changed.

Figure 13. Thermal Compensation method for Single Phase

The current sense network equation is as follows :

$$\Delta V_{IMON} = V_{IMON} - V_{REF} = \frac{I_{LX} \times DCR \times \frac{R_S + (R_P // R_{NTC})}{R_X + (R_S + R_P // R_{NTC})}}{R_{CS}} \times R_{IMON}$$

Usually,  $R_P$  is set equal to  $R_{NTC}$  ( 25°C).  $R_S$  is selected to linearize the NTC’s temperature characteristic. For a given NTC, design is to get  $R_X$  and  $R_S$  to compensate the temperature variation of the sense resistor.

Let

$$R_{EQU} = R_S + (R_P // R_{NTC})$$

According to current sense network, the corresponding equation is represented as follows :

$$\frac{L_X}{DCR} = C_X \times \frac{R_{EQU} \times R_X}{R_{EQU} + R_X}$$

Next, let

$$m = \frac{L_X}{DCR \times C_X}$$

Then

$$m \times \left( R_X + R_S + \frac{R_{NTC} \times R_P}{R_{NTC} + R_P} \right) = R_X \times \left( R_S + \frac{R_{NTC} \times R_P}{R_{NTC} + R_P} \right)$$

Step1 : Given the two system temperature  $T_R$  and  $T_H$  at which are compensated.

Step2 : Two equations can be listed as

$$m(T_R) \times \left( R_X + R_S + \frac{R_{NTC}(T_R) \times R_P}{R_{NTC}(T_R) + R_P} \right) = R_X \times \left( R_S + \frac{R_{NTC}(T_R) \times R_P}{R_{NTC}(T_R) + R_P} \right)$$

$$m(T_H) \times \left( R_X + R_S + \frac{R_{NTC}(T_H) \times R_P}{R_{NTC}(T_H) + R_P} \right) = R_X \times \left( R_S + \frac{R_{NTC}(T_H) \times R_P}{R_{NTC}(T_H) + R_P} \right)$$

Step3 : Usually  $R_P$  is set to equal to  $R_{NTC}(T_R)$ . And hence, there are two equations and two unknowns,  $R_X$  and  $R_S$  can be found out.

Above thermal compensation method needs a NTC resistor in each phase. In order to reduce the NTC amount for multi-phase application, another thermal compensation method is presented. This method can be applied to multi-phase application and it only needs one NTC resistor. So, the NTC resistor cost can be saved by using this method. Figure 14 shows the thermal compensation method for dual phase.

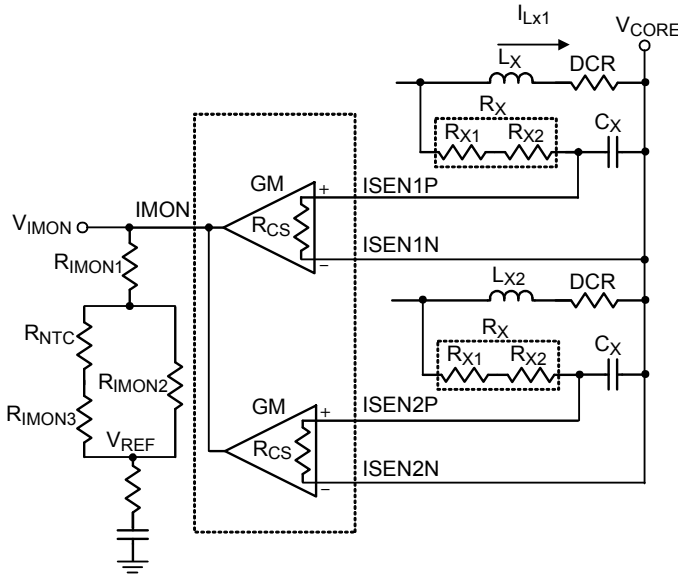

Figure 14. Thermal Compensation method for dual Phase

The current sense network equation is as follows :

$$V_{IMON} - V_{ref} = \frac{\sum_{X=1}^2 I_{LX} \times DCR}{R_{CS}} \times \{R_{IMON1} + [R_{IMON2} // (R_{IMON3} + R_{NTC})]\}$$

Please note that  $V_{IMON}$  is equal to 1V for single phase application and  $V_{IMON}$  is equal to 1.4V for dual phase application under ICCMAX condition.

A resistor network with NTC thermistor compensation connecting between IMON pin and VREF pin is used to compensate the positive temperature coefficient of inductor DC. The design flow is as follows :

Step1: Given the three temperature  $T_L$ ,  $T_R$  and  $T_H$ , at which are compensated.

Step 2 : Three equations can be listed as

$$\frac{DCR(T_L)}{R_{CS}} = \sum_{i=1}^2 I_{Li} \times R_{IMON}(T_L) = 0.4$$

$$\frac{DCR(T_R)}{R_{CS}} = \sum_{i=1}^2 I_{Li} \times R_{IMON}(T_R) = 0.4$$

$$\frac{DCR(T_H)}{R_{CS}} = \sum_{i=1}^2 I_{Li} \times R_{IMON}(T_H) = 0.4$$

Where :

(1) The relationship between DCR and temperature is as follows :

$$DCR(T) = DCR(25^\circ C) \times [1 + 0.00393(T-25)]$$

(2)  $R_{IMON}(T)$  is the equivalent resistor of the resistor network with a NTC thermistor

$$R_{IMON}(T) = R_{IMON1} + \{R_{IMON2} // [R_{IMON3} + R_{NTC}(T)]\}$$

And the relationship between NTC and temperature is as follows :

$$R_{NTC}(T) = R_{NTC}(25^\circ C) \times e^{\beta \left( \frac{1}{T+273} - \frac{1}{298} \right)}$$

$\beta$  is in the NTC thermistor datasheet.

Step 3 : Three equation and three unknowns,  $R_{IMON1}$ ,  $R_{IMON2}$  and  $R_{IMON3}$  can be calculated out unique solution.

$$R_{IMON1} = K_{TR} - \frac{R_{IMON2} \times (R_{NTCTR} + R_{IMON3})}{R_{IMON2} + R_{NTCTR} + R_{IMON3}}$$

$$R_{IMON2} = \sqrt{[K_{R3}^2 + K_{R3}(R_{NTCTL} + R_{NTCTR}) + R_{NTCTL}R_{NTCTR}] \alpha_{TL}}$$

$$R_{IMON3} = -R_{IMON2} + K_{R3}$$

Where :

$$\alpha_{TH} = \frac{K_{TH} - K_{TR}}{R_{NTCTH} - R_{NTCTR}}$$

$$\alpha_{TL} = \frac{K_{TL} - K_{TR}}{R_{NTCTL} - R_{NTCTR}}$$

$$K_{R3} = \frac{(\alpha_{TH}/\alpha_{TL})R_{NTCTH} - R_{NTCTL}}{1 - (\alpha_{TH}/\alpha_{TL})}$$

$$K_{TL} = \frac{0.4}{\frac{DCR(T_L)}{R_{CS}} \times ICCMAX}$$

$$K_{TR} = \frac{0.4}{\frac{DCR(T_R)}{R_{CS}} \times ICCMAX}$$

$$K_{TH} = \frac{0.4}{\frac{DCR(T_H)}{R_{CS}} \times ICCMAX}$$

**Current Monitor, IMON**

For each VR rail, the RT3601BC includes a current monitor (IMON) function which can be used to detect over-current protection and maximum processor current ICCMAX, and also sets a part of current gain in the load-line setting. It produces an analog voltage proportional to output current between the IMON and VREF pins.

**Load-Line (Droop) Setting**

The G-NAVP™ topology can set load-line (droop) via the current loop and voltage loop, the load-line is a slope between load current I<sub>CC</sub> and output voltage V<sub>sen</sub> as shown in Figure 15. Figure 16 shows the voltage control and current loop for Main and SA rails. By using both loops, the load-line (droop) can be set easily. The load-line set equation for Main and SA is :

$$R_{LL} = \frac{A_I}{A_V} = \frac{\frac{k_i}{2} \times \frac{DCR}{R_{CS}} \times R_{OUT}}{\frac{R_2}{R_1}} = \frac{\frac{k_i}{2} \times DCR}{\frac{R_2}{R_1}} \text{ (m}\Omega\text{)}$$

where R<sub>OUT</sub> = R<sub>CS</sub>

Figure 15. Load-Line (Droop)

Figure 17 shows the voltage control and current loop for AUXI rail. By using both loops, the load-line (droop) can be set easily. The load-line set equation for AUXI is :

$$R_{LL} = \frac{A_I}{A_V} = \frac{\frac{k_i}{2} \times \frac{DCR}{R_{CS}} \times R_{IMON}}{\frac{R_2}{R_1}}$$

Where R<sub>CS</sub> = 2.15kΩ

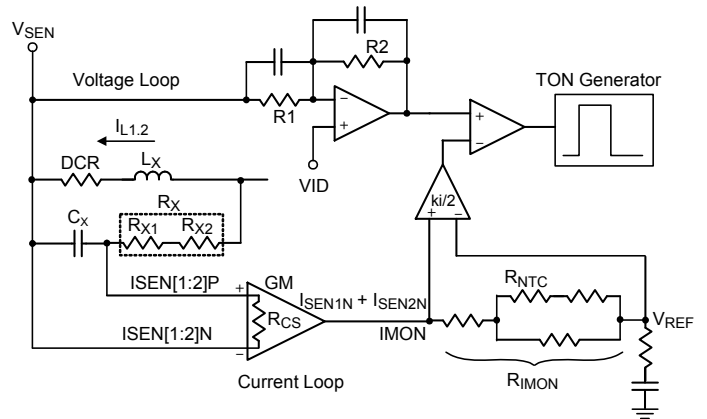

Figure 17. Voltage Loop and Current Loop for AUXI

The ki gain can be selected by SET [1:3] pins for individual rail.

**Compensator Design**

The compensator of the RT3601BC doesn't need a complex type II or type III compensator to optimize control loop performance. It can adopt a simple type I compensator (one pole, one zero) in the G-NAVP™ topology to achieve constant output impedance design for Intel IMVP8 ACLL specification. The one pole one zero compensator is shown as Figure 18. The transfer function of compensator should be design as following transfer function to achieve constant output impedance, i.e. Z<sub>o</sub>(s) = load-line slope in the entire frequency range :

$$G_{CON}(S) \approx \frac{A_I}{R_{LL}} \frac{1 + \frac{s}{\omega \times f_{SW}}}{1 + \frac{s}{\omega_{ESR}}}$$

where A<sub>I</sub> is current loop gain, R<sub>LL</sub> is load-line, f<sub>SW</sub> is switching frequency and ω<sub>ESR</sub> is a pole that should be located at 1/(C<sub>OUT</sub> × ESR). Then, the C1 and C2 should be designed as follows :

$$C1 = \frac{1}{R1 \times \pi \times f_{SW}} \quad C2 = \frac{C_{OUT} \times ESR}{R2}$$

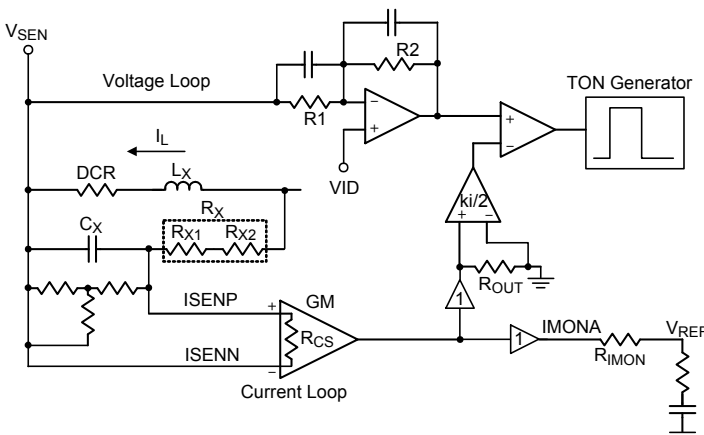

Figure 16. Voltage Loop and Current Loop for Main and SA Rails

Figure 18. Type I compensator

**Differential Remote Sense Setting**

The VR provides differential remote-sense inputs to eliminate the effects of voltage drops along the PC board traces, CPU internal power routes and socket contacts for Main and AUXI rails. The CPU contains on-die sense pins,  $V_{CC\_SENSE}$  and  $V_{SS\_SENSE}$ . Connect RGND to  $V_{SS\_SENSE}$  and connect FB to  $V_{CC\_SENSE}$  with a resistor to build the negative input path of the error amplifier as shown in Figure 19. The  $V_{DAC}$  and the precision voltage reference are referred to RGND for accurate remote sensing.

Figure 19. Remote Sensing Circuit

**Maximum Processor Current Setting, I<sub>MAX</sub>**

The maximum processor current  $I_{MAX}$  for each VR rail can be set by TSEN\_Main and TSEN\_AUXI pins. Each VR  $I_{MAX}$  register is set by an external voltage divider with the multi-function mechanism. Table 4 and Table 5 show the each VR  $I_{MAX}$  setting on TSEN\_Main and TSEN\_AUXI pins.

**System Input Power Monitor, PSYS**

The RT3601BC provides PSYS function to monitor total platform system power, and the obtained information will be provided directly to the CPU via the SVID interface. The PSYS function can be described as in Figure 20. When the maximum PSYS voltage  $V_{PSYS} = 3.2V$ , the RT3601BC will generate an 8-bit code, FF, which will be stored in the 1Bh register. To choose the resistor value R, for example, if the maximum current from the PSYS "Meter"  $I = 320\mu A$  in conjunction with  $V_{PSYS} = 3.2V$ ,  $R = V_{PSYS} / I = 10k\Omega$  can be obtained.

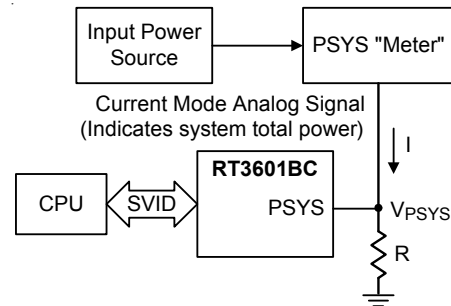

Figure 20. PSYS Function Block Diagram

## Dynamic VID (DVID) Compensation

When VID transition event occurs, a charge current will be generated in the loop to cause DVID performance is deteriorated by this induced charge current, the phenomenon is called droop effect. The droop effect is shown in Figure 21. When VID up transition occurs, the output capacitor will be charged by inductor current. Since current signal is sensed in inductor, an induced charge current will appear in control loop. The induced charge current will produce a voltage drop in R1 to cause output voltage to have a droop effect. Due to this, VID transition performance will be deteriorated.

The RT3601BC provides a DVID compensation function. By the DVID compensation to cancel the real induced charge current signal and the virtual charge current signal is defined in Figure 22. Figure 23 shows the operation of cancelling droop effect. A virtual charge current signal is established first and then VID signal plus virtual charge current signal to be generated on the FB pin. Hence, an induced charge current signal flows to R1 and is cancelled to reduce droop effect.

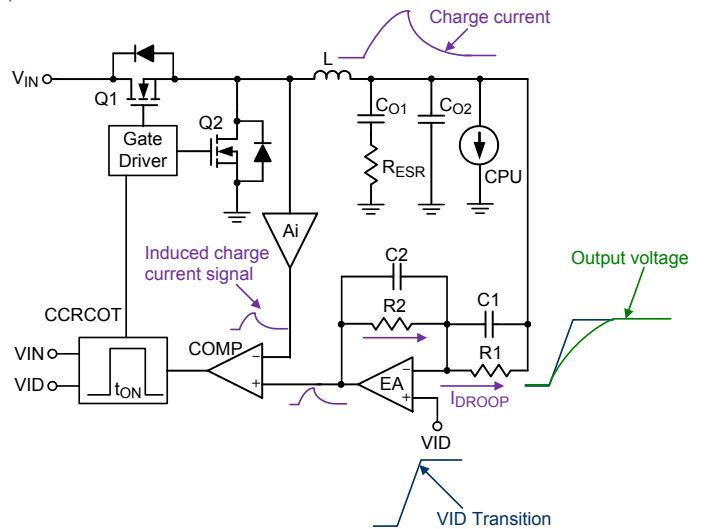

Figure 21. Droop Effect in VID transition

Figure 22. Definition of Virtual Charge Current Signal

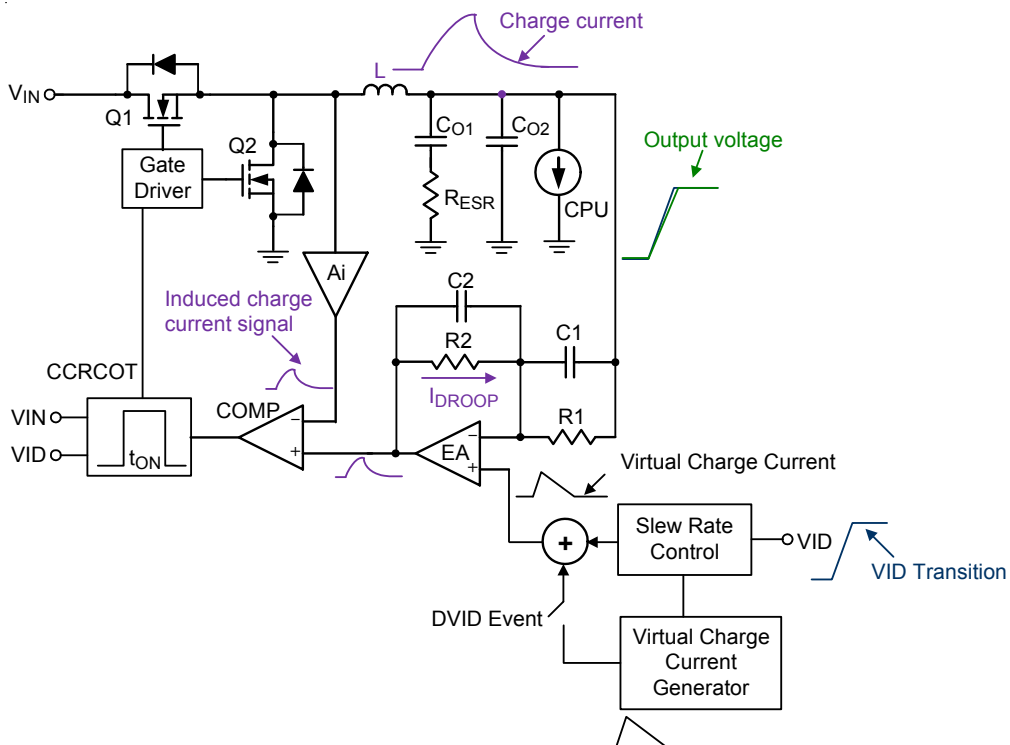

Figure 23. DVID Compensation

Table 4 and Table 5 show the each VR DVID threshold setting on TSEN\_Main and TSEN\_AUX1 pins. The each VR DVID width is equal to 2μs. For example, VR IMAXs are 34A, 6A and 40A for Main rail, SA rail and AUX1 rail, respectively. And DIVDTHs are all set as 15mV for each rail. The V<sub>TSEN\_Main</sub> and V<sub>TSEN\_AUX1</sub> need to be set as 0.25V and 0.15V, respectively. Please note that a high accuracy resistor is needed for this setting, <1% error tolerance is recommended.

**Ramp Compensation**

The G-NAVP™ topology is one type of ripple based control that has fast transient response and can lower BOM cost. However, ripple based control usually has no good noise immunity. The RT3601BC provides the ramp compensation to increase noise immunity and reduce jitter at the switching node. Figure 24 shows the ramp compensation.

Figure 24. Ramp Compensation

**Quick Response (QR) Mechanism**

When the transient load step-up becomes quite large, it is difficult for loop response to meet the energy transfer. Hence, that output voltage generate undershoot to fail specification. The RT3601BC has Quick Response (QR) mechanism being able to improve this issue. It adopts a nonlinear control mechanism which can disable interleaving function and simultaneously turn on all UGATE one pulse at instantaneous step-up transient load to restrain the output voltage drooping. Figure 25 shows the QR behavior.

Figure 25. Quick Response Mechanism

The output voltage signal behavior needs to be detected so that QR mechanism can be triggered. The output voltage signal is via a remote sense line to connect at the VSEN pin which is shown in Figure 26. The QR mechanism needs to set QR width and QR threshold. Both definitions are shown in Figure 24. A proper QR mechanism set can meet different applications. The SET1 and SET2 pins can set QR threshold and QR width by internal current source 80μA with multi-function pin setting mechanism for Main and AUX1 VR rails. Table 6 shows the QR\_TH and QR\_WIDTH for Main and AXUI VR rails on the SET[1:2] pins.

Figure 26. Simplified QR Trigger schematic

Table 5. SET[1:2] pins setting for QR Threshold and QR Width

$V_{SET[1 \text{ and } 2]_I} = 80\mu \times \frac{R1 \times R2}{R1 + R2}$				QRTH_X (mV)	QEWIDTH_X (% of On-Time)
Min	Typ	Max	Unit		
49.54839	50.04888	50.54936	mV	Disable	130%
148.6452	150.1466	151.6481	mV		70%
247.7419	250.2444	252.7468	mV	15	130%
346.8387	350.3421	353.8456	mV		70%
445.9355	450.4399	454.9443	mV	20	130%
545.0323	550.5376	556.043	mV		70%
644.129	650.6354	657.1417	mV	25	130%
743.2258	750.7331	758.2405	mV		70%
842.3226	850.8309	859.3392	mV	30	130%
941.4194	950.9286	960.4379	mV		70%
1040.516	1051.026	1061.537	mV	35	130%
1139.613	1151.124	1162.635	mV		70%
1238.71	1251.222	1263.734	mV	40	130%
1337.806	1351.32	1364.833	mV		70%
1436.903	1451.417	1465.932	mV	45	130%
1536	1551.515	1567.03	mV		70%

For example, 35mV QR threshold and 1.3 x TON QR width are set. According to Table 6, the set voltage should be between 1.261V and 1.291V. Please note that a high accuracy resistor is needed for this setting accuracy, <1% error tolerance is recommended.

**Zero Load-Line Setting and Anti-overshoot function**

The SET3 pin can be enabled/disabled zero load-line function for SA rail and can be enabled/disabled anti-overshoot function for each VR rail. Table 7 show the zero load-line function for SA rail and anti-overshoot function for each VR rail on the SET3 pin.

When DVID slew rate increases, loop response is difficult to meet energy transfer so that output voltage generates overshoot to fail specification. The RT3601BC has anti-overshoot function being able to help improve this issue. The VR will turn off low-side MOSFET when output voltage ramps up to the target VID (ALERT signal be pulled low). This function also can improve the overshoot during the load transient condition. When anti-overshoot function is triggered, the UGATE and LGATE signal will be masked to reduce the overshoot amplitude.

Table 6. SET3 Pin Setting for anti-overshoot and zero load-line

$V_{SET3\_I} = 80\mu \times \frac{R1 \times R2}{R1 + R2}$				ANTIOVS			SA_0LL

1536	1551.515	1567.03	mV				Enable	Enable

**Over-Current Protection**

The RT3601BC has dual OCP mechanism. One is named SUM-OCP, the other is called SPIKE-OCP. The over current protection (OCP) forces high-side MOSFET and low-side MOSFET off by shutting down internal PWM logic drivers. RT3601BC provides SUM-OCP which is 160% of IMON\_04. IMON\_04 is the current that makes  $V_{IMON} - V_{REF} = 0.4V$ . When output current is higher than the SUM-OCP threshold, SUM-OCP is latched with a 40µs delay time to prevent false trigger. Besides, the SUM-OCP function is masked when dynamic VID transient occurs and after dynamic VID transition, SUM-OCP is masked for 80µs. The other one is SPIKE-OCP which should trip when the output current exceeds SPIKE\_OCP threshold during first DVID. SPIKE\_OCP threshold is dependent on IMAX level as shown in Table 4 and Table 5. When output current is higher than the SPIKE-OCP threshold, SPIKE-OCP is latched with a 1µs delay time to prevent false trigger.

**Output Over-Voltage Protection**

An OVP condition is detected when the VSEN pin is 350mV more than VID. When OVP is detected, the high-side gate voltage UGATEx is pulled low and the low-side gate voltage LGATEx is pulled high. OVP is latched with a 0.5µs delay- to prevent false trigger.

**Negative Voltage Protection**

Since the OVP latch continuously turns on all low-side MOSFETs of the VR, the VR will suffer negative output voltage. When the VSEN detects a voltage below -0.07V after triggering OVP, the VR triggers NVP to turn off all low-side MOSFETs of the VR while the high-side MOSFETs remain off. After triggering NVP, if the output voltage rises above 0V, the OVP latch restarts to turn on all low-side MOSFETs. Therefore, the output voltage may bounce between 0V and -0.07V due to OVP latch and NVP triggering. The NVP function will be active only after OVP is triggered.

## Under-Voltage Protection

When the VSEN pin voltage is 350mV less than VID, UVP will be latched. When UVP latched, the both UGATE<sub>x</sub> and LGATE<sub>x</sub> are pulled low. A 3μs delay is used in UVP detection circuit to prevent false trigger. Besides, the UVP function is masked when dynamic VID transient occurs and after dynamic VID transition, UVP is masked for 80μs.

### Design Step :

The RT3601BC Excel based design tool is available. Users can contact your Richtek representative to get the spreadsheet. Three main design procedures of the RT3601BC design, first step is loop design, second step is pin setting design, and the last step is protection settings. The following design example is to explain the RT3601BC design procedure :

### Main VR

	V <sub>Main</sub> Specification
Input Voltage	19V
No. of Phase	1
Normal VID	1.35V
ICCMAX	34
ICC-Dyn	28
Load-Line	2.1mΩ
Fast Slew Rate	37.5mV/μs
MAX Switching Frequency	700kHz

The output filter requirements of VRTB specification are as follows :

Output Inductor : 220nH/0.875mΩ

Output Ceramic Capacitor: 47μF (6pcs)

Output Ceramic Capacitor: 10μF (9pcs)

Loop Design :

- On time setting: Using the specification, then can get that T<sub>ON</sub> is 108ns.

The k<sub>TON</sub> parameter can be calculated after the on-time is decided.

$$T_{ON} = \frac{1.2\mu \times V_{DAC}}{k_{TON} \times (V_{IN} - V_{DAC})} + 15n$$

Choosing the nearest on-time setting k<sub>TON</sub> = 1.4

- Current sensor adopts lossless RC filter to sense current signal in DCR. For getting an expected load transient waveform R<sub>X</sub>C<sub>X</sub> time constant needs to match L<sub>X</sub>/DCR<sub>X</sub>. C<sub>X</sub> = 0.47μF, R<sub>NTC</sub> = 10kΩ and R<sub>P</sub> = 10kΩ are set, then

$$R_{EQU} = R_S + (R_P // R_{NTC})$$

$$\frac{L_X}{DCR} = C_X \times \frac{R_{EQU} \times R_X}{R_{EQU} + R_X}$$

By using the design tool, R<sub>S</sub> and R<sub>X</sub> can be determined, are equal to 220Ω and 590Ω, respectively.

- IMON resistor network design :

$$R_{IMON} = \frac{\Delta V_{IMON} \times 2.15k}{ICCMAX \times DCR \times \frac{R_{EQU}}{R_X + R_{EQU}}} = 32.17k\Omega$$

- Load-line design : 2.1mΩ droop is requirement, because DCR and k<sub>i</sub> are decided to 0.875mΩ and 20, respectively. The voltage loop A<sub>v</sub> gain is also can be determined by following equation :

$$R_{LL} = \frac{A_i}{A_v} = \frac{k_i \times DCR}{\frac{R_2}{R_1}}$$

R<sub>1</sub> = 10kΩ is usually decided and here R<sub>2</sub> is chosen to 37.4kΩ.

- Typical compensator design can use the following equations to design C<sub>1</sub> and C<sub>2</sub> values

$$C_1 = \frac{1}{R_1 \times \pi \times F_{SW}} \approx 45.5pF$$

$$C_2 = \frac{C_{OUT} \times ESR}{R_2} \approx 33pF$$

For Intel platform, in order to induce the band width to enhance transient performance to meet Intel's criterion, the zero location can be designed close to 1/10 of the switching frequency or less than the 1/10 of switching frequency.

**SA VR**

	<b>V<sub>SA</sub> Specification</b>
Input Voltage	19V
No. of Phase	1
Normal VID	1.05V
ICCMAX	6
ICC-Dyn	3
Load-Line	10.3mΩ
Fast Slew Rate	37.5mV/μs
MAX Switching Frequency	800kHz

The output filter requirements of VRTB specification are as follows :

Output Inductor: 820nH/6.7mΩ

Output Ceramic Capacitor: 47μF (4pcs)

Output Ceramic Capacitor: 10μF (8pcs)

Loop Design :

- On time setting : Using the specification, then can get that T<sub>ON</sub> is 96ns.

The k<sub>TON</sub> parameter can be calculated after the on-time is decided.

$$T_{ON} = \frac{1.2\mu \times V_{DAC}}{k_{TON} \times (V_{IN} - V_{DAC})} + 15n$$

Choosing the nearest on-time setting k<sub>TON</sub> = 1.4

Current sensor adopts lossless RC filter to sense current signal in DCR. For getting an expected load transient waveform R<sub>X</sub>C<sub>X</sub> time constant needs to match L<sub>X</sub>/DCR<sub>X</sub>. C<sub>X</sub> = 0.47μF, R<sub>NTC</sub> = 4.7kΩ and R<sub>p</sub> = 4.7kΩ are set, then

$$R_{EQU} = R_S + (R_P // R_{NTC})$$

$$\frac{L_X}{DCR} = C_X \times \frac{R_{EQU} \times R_X}{R_{EQU} + R_X}$$

By using the design tool, R<sub>S</sub> and R<sub>X</sub> can be determined, are equal to 165Ω and 280Ω, respectively.

- IMON resistor network design :

$$R_{IMON} = \frac{\Delta V_{IMON} \times 2.15k}{ICCMAX \times DCR \times \frac{R_{EQU}}{R_X + R_{EQU}}} = 23.79k\Omega$$

- Load-line design : 10.3mΩ droop is requirement, because DCR and k<sub>i</sub> are decided to 6.7mΩ and 20, respectively. The voltage loop Av gain is also can be determined by following equation :

$$R_{LL} = \frac{A_I}{A_V} = \frac{\frac{k_i}{2} \times DCR}{\frac{R_2}{R_1}}$$

R<sub>1</sub> = 10kΩ is usually decided and here R<sub>2</sub> is chosen to 58.5kΩ.

Typical compensator design can use the following equations to design C<sub>1</sub> and C<sub>2</sub> values

$$C_1 = \frac{1}{R_1 \times \pi \times F_{SW}} \approx 45.5pF$$

$$C_2 = \frac{C_{OUT} \times ESR}{R_2} \approx 56pF$$

For Intel platform, in order to induce the band width to enhance transient performance to meet Intel's criterion, the zero location can be designed close to 1/10 of the switching frequency or less than the 1/10 of switching frequency.

**AVXI VR**

	<b>V<sub>AUX1</sub> Specification</b>
Input Voltage	19V
No. of Phase	1
Normal VID	1.35V
ICCMAX	40
ICC-Dyn	37
Load-Line	3.1mΩ
Fast Slew Rate	37.5mV/μs
MAX Switching Frequency	700kHz

The output filter requirements of VRTB specification are as follows :

Output Inductor: 220nH/0.875mΩ

Output Bulk Capacitor: 330μF/2V.4.5mΩ (1pcs)

Output Ceramic Capacitor: 47μF (6pcs)

Output Ceramic Capacitor: 22μF (7pcs)

Output Ceramic Capacitor: 10μF (2pcs)

Loop Design :

- On time setting: Using the specification, then can get that  $T_{ON}$  parameter can be calculated after the on-time is decided.

$$T_{ON} = \frac{1.2\mu \times V_{DAC}}{k_{TON} \times (V_{IN} - V_{DAC})} + 15n$$

Choosing the nearest on-time setting  $k_{TON} = 1.1$

- Current sensor adopts lossless RC filter to sense current signal in DCR. For getting an expected load transient waveform  $R_X C_X$  time constant needs to match  $L_X / DCR_X$ .  $C_X = 0.47\mu F$  is set, then

$$R_X = \frac{L_X}{1\mu F \times DCR_X} = 530\Omega$$

- IMON resistor network design :  $T_L = 25^\circ C$ ,  $T_R = 50^\circ C$  and  $T_H = 100^\circ C$  are decided, NTC thermistor =  $100k\Omega @ 25^\circ C$ ,  $\beta = 4485$  and  $ICCMAX = 40A$ .  $R_{IMON1} = 22.07k\Omega$ ,  $R_{IMON2} = 41.03k\Omega$  and  $R_{IMON3} = 3 \times 8.3k\Omega$  can be decided. The  $R_{EQ}(25^\circ C) = 53.71k\Omega$ .
- Load-line design:  $3.1m\Omega$  droop is requirement, because DCR and  $k_i$  are decided to  $0.875m\Omega$  and  $2$ , respectively. The voltage loop  $A_v$  gain is also can be determined by following equation :

$$R_{LL} = \frac{A_i}{A_v} = \frac{\frac{k_i}{2} \times \frac{DCR}{R_{CS}} \times R_{IMON}}{\frac{R_2}{R_1}}$$

$R_1 = 10k\Omega$  is usually decided and here  $R_2$  is chosen to  $64.51k\Omega$ .

- Typical compensator design can use the following equations to design  $C_1$  and  $C_2$  values

$$C_1 = \frac{1}{R_1 \times \pi \times F_{SW}} \approx 45.5pF$$

$$C_2 = \frac{C_{OUT} \times ESR}{R_2} \approx 55pF$$

For intel platform, in order to induce the band width to enhance transient performance to meet intel's criterion, the zero location can be designed close to  $1/10$  of the switching frequency or less than the  $1/10$  of switching frequency.

Pin Setting Design :

SET1 resistor network design: From above designs, parameters of  $k_{TON\_Main}$  and  $k_{i\_Main}$  are  $1.1$  and  $20$ ,

respectively. The Main\_QR\_TH is set to disable and Main\_QR\_Width is designed as  $0.7 \times T_{ON}$ . By using the information, the two equation can be listed by using multi-function pin setting mechanism :

$$3.2 \times \frac{R_2}{R_1 + R_2} = 675.7mV$$

$$80\mu \times \frac{R_1 \times R_2}{R_1 + R_2} = 175.2mV$$

$R_1 = 10.37k\Omega$  and  $R_2 = 2.78k\Omega$ .

- SET2 resistor network design : From above designs, parameters of  $k_{TON\_AUXI}$  and  $k_{i\_AUXI}$  are  $1.1$  and  $2$ , respectively. The AUXI\_QR\_TH is set to  $15mV$  and AUXI\_QR\_Width is designed as  $0.7 \times T_{ON}$ . By using the information, the two equation can be listed by using multi-function pin setting mechanism :

$$3.2 \times \frac{R_2}{R_1 + R_2} = 575.56mV$$

$$80\mu \times \frac{R_1 \times R_2}{R_1 + R_2} = 575.56mV$$

$R_1 = 40k\Omega$  and  $R_2 = 8.77k\Omega$ .

- SET3 resistor network design: From above designs, parameters of  $k_{TON\_SA}$  and  $k_{i\_SA}$  are  $1.4$  and  $20$ , respectively. The anti-overshoot function is enabled for Main and AUXI rails. The anti-overshoot function and zero load-line function for SA rail both are disabled. The tri-state delay is disable, too. By using the information, the two equation can be listed by using multi-function pin setting mechanism :

$$3.2 \times \frac{R_2}{R_1 + R_2} = 675.66mV$$

$$80\mu \times \frac{R_1 \times R_2}{R_1 + R_2} = 1276.24mV$$

$R_1 = 75.56k\Omega$  and  $R_2 = 20.22k\Omega$ .

- TSEN\_Main resistor network design : The DIVD threshold is  $60mV$  for SA rail. And the IMAXs are designed as  $40A$  and  $6A$  for AUXI rail and SA rail, respectively. By using the information, the equation can be shown as below :

$$3.2 \times \frac{R_2}{R_1 + R_2} = 1.851V$$

- TSEN\_AUXI resistor network design : The DIVD thresholds are  $15mV$  and  $60mV$  for Main rail and AUXI rail, respectively. And the IMAX is designed as  $34A$  for

Main rail. By using the information, the equation can be listed by using multi-function pin setting mechanism :

$$3.2 \times \frac{R_2}{R_1 + R_2} = 550\text{mV}$$

Protection Settings :

- OVP/UVLP protections: When the VSEN pin voltage is 350mV higher than VID, the OVP will be latched. When the VSEN pin voltage is 350mV lower than VID, the UVP will be latched.

- TSEN and VR\_HOT design : Using the following equation to calculate related resistances for VR\_HOT setting.

$$V_{TSEN} = 80\mu \times (R_3 // R_{NTC}) + (R_1 // R_2)$$

Choosing  $R_1 = 100\text{k}\Omega$  and an NTC thermistor  $R_{NTC(25^\circ\text{C})} = 100\text{k}\Omega$  and its  $\beta = 4485$ . When temperature is  $100^\circ\text{C}$ , the  $R_{NTC(100^\circ\text{C})} = 4.85\text{k}\Omega$ . According to TSEN pins for multi-function mechanism, three equations can be got as following for Main VR rail :

$$V_{TSEN\_Main(25^\circ\text{C})} = 80\mu \times (R_3 // R_{NTC(25^\circ\text{C})}) + (R_1 // R_2) = 1.624\text{V}$$

$$V_{TSEN\_Main(100^\circ\text{C})} = 80\mu \times (R_3 // R_{NTC(100^\circ\text{C})}) + (R_1 // R_2) = 1.092\text{V}$$

$$3.2 \times \frac{R_2}{R_1 + R_2} = 1.851\text{V}$$

$R_1 = 15.214\text{k}\Omega$ ,  $R_2 = 20.898\text{k}\Omega$  and  $R_3 = 5618.685\text{k}\Omega$ .

Three equations can be got as following for AUXI VR rail :

$$V_{TSEN\_AUXI(25^\circ\text{C})} = 80\mu \times (R_3 // R_{NTC(25^\circ\text{C})}) + (R_1 // R_2) = 1.624\text{V}$$

$$V_{TSEN\_AUXI(100^\circ\text{C})} = 80\mu \times (R_3 // R_{NTC(100^\circ\text{C})}) + (R_1 // R_2) = 1.092\text{V}$$

$$3.2 \times \frac{R_2}{R_1 + R_2} = 550\text{mV}$$

$R_1 = 16.083\text{k}\Omega$ ,  $R_2 = 19.059\text{k}\Omega$  and  $R_3 = 5618.685\text{k}\Omega$ .

**Thermal Considerations**

The junction temperature should never exceed the absolute maximum junction temperature  $T_{J(MAX)}$ , listed under Absolute Maximum Ratings, to avoid permanent damage to the device. The maximum allowable power dissipation depends on the thermal resistance of the IC package, the PCB layout, the rate of surrounding airflow, and the difference between the junction and ambient temperatures. The maximum power dissipation can be calculated using the following formula :

$$P_{D(MAX)} = (T_{J(MAX)} - T_A) / \theta_{JA}$$

where  $T_{J(MAX)}$  is the maximum junction temperature,  $T_A$  is the ambient temperature, and  $\theta_{JA}$  is the junction-to-ambient thermal resistance.

For continuous operation, the maximum operating junction temperature indicated under Recommended Operating Conditions is  $125^\circ\text{C}$ . The junction-to-ambient thermal resistance,  $\theta_{JA}$ , is highly package dependent. For a WQFN-52L 6x6 package, the thermal resistance,  $\theta_{JA}$ , is  $26.5^\circ\text{C/W}$  on a standard JEDEC 51-7 high effective-thermal-conductivity four-layer test board. The maximum power dissipation at  $T_A = 25^\circ\text{C}$  can be calculated as below :

$$P_{D(MAX)} = (125^\circ\text{C} - 25^\circ\text{C}) / (26.5^\circ\text{C/W}) = 3.77\text{W}$$

for a WQFN-52L 6x6 package.

The maximum power dissipation depends on the operating ambient temperature for the fixed  $T_{J(MAX)}$  and the thermal resistance,  $\theta_{JA}$ . The derating curves in Figure 27 allows the designer to see the effect of rising ambient temperature on the maximum power dissipation.

Figure 27. Derating Curve of Maximum Power Dissipation

Richtek products are sold by description only. Customers should obtain the latest relevant information and data sheets before placing orders and should verify that such information is current and complete. Richtek cannot assume responsibility for use of any circuitry other than circuitry entirely embodied in a Richtek product. Information furnished by Richtek is believed to be accurate and reliable. However, no responsibility is assumed by Richtek or its subsidiaries for its use; nor for any infringements of patents or other rights of third parties which may result from its use. No license is granted by implication or otherwise under any patent or patent rights of Richtek or its subsidiaries.

## X-ON Electronics

Largest Supplier of Electrical and Electronic Components
