## DESCRIPTION

The RS3005 series is a set of low power high voltage regulators implemented in CMOS technology. It can operate from 2.5V to 36V. Which can provide 150mA output current. The device allows input voltage as high as 36V.

The RS3005 series is available in several fixed output voltages. CMOS technology ensures low dropout voltage and ultralow quiescent current.

The RS3005 is available in Green SOT23-3, SOT23, SOT23-5, SOT89-3L and TO-92 packages. It operates over an ambient temperature range of -40°C to +85°C.

### NOTES:

- $V_{IN} = V_{OUT}$  (NOMINAL) or 2.5V, whichever is greater.
- Maximum output current is affected by the PCB layout, size of metal trace, the thermal conduction path between metal layers, ambient temperature and the other environment factors of system. Attention should be paid to the dropout voltage when  $V_{IN} < V_{OUT} + V_{DROP}$ .
- The dropout voltage is defined as  $V_{IN} - V_{OUT}$ , when  $V_{OUT}$  is 100mV below the value of  $V_{OUT}$  for  $V_{IN} = V_{OUT}$  (NOMINAL) + 2V.
- Output voltage temperature coefficient is defined as the worst-case voltage change divided by the total temperature range.
- Time needed for  $V_{OUT}$  to reach 90% of final value.

## DETAILED DESCRIPTION

### Overview

The RS3005 low-dropout regulators (LDO) consumes only 11 $\mu$ A of quiescent current at light load and delivers excellent line and load transient performance. These characteristics, combined with low noise and good PSRR with low dropout voltage, make this device ideal for portable consumer applications.

### Functional Block Diagram

### Thermal Considerations

When the junction temperature is too high, the thermal protection circuitry sends a signal to the control logic that will shut down the IC. The IC will restart when the temperature has sufficiently cooled down. The maximum power dissipation is dependent on the thermal resistance of the case and the circuit board, the temperature difference between the die junction and the ambient air, and the rate of air flow. The GND pin must be connected to the ground plane for proper dissipation.

### Operation with $V_{IN}$ Lower Than 2.5V

The device normally operates with input voltages above 2.5V. At input voltages below the 2.5V, the device does not operate.

### Operation with $V_{IN}$ Larger Than 2.5V

When  $V_{IN}$  is greater than 2.5V, if  $V_{IN}$  is also higher than the output set value plus the device dropout voltage,  $V_{OUT}$  is equal to the set value. Otherwise,  $V_{OUT}$  is equal to  $V_{IN}$  minus the dropout voltage.
