Simplified Schematic

DESCRIPTION

The quadruple buffer is designed for 1.65V to 5.5V V_{CC} operation. The RS4G125 device is quadruple line drivers with 3-state outputs. The outputs are disabled when the output-enable (\overline{OE}) input is high.

This device is fully specified for partial-power-down applications using I_{off}. The I_{off} circuitry disables the outputs, preventing damaging current backflow through the device when it is powered down.

To ensure the high-impedance state during power up or power down, \overline{OE} should be tied to V_{CC} through a pullup resistor, the minimum value of the resistor is determined by the current-sinking capability of the driver.

The RS4G125 is available in Green SOIC-14(SOP14) and TSSOP-14 packages. It operates over an ambient temperature range of -40°C to +125°C.
