## Nano-Power, CMOS Input, RRIO, Push-Pull Output Comparator

## FEATURES

- Low supply current 400 nA (TYP) at Vs $=1.4 \mathrm{~V}$
- Low input offset voltage: $\operatorname{Vos}(\max )= \pm 3 \mathrm{mV}$
- Rail-to-Rail Input and output
- SUPPLY RANGE: +1.4 V to +5.5 V
- SPECIFIED UP TO +125 ${ }^{\circ} \mathrm{C}$
- Micro SIZE PACKAGES: SOIC-8(SOP8), MSOP-8

## APPLICATIONS

- OVERVOLTAGE AND UNDERVOLTAGE DETECTION
- MULTIVIBRATORS
- OVERCURRENT DETECTION
- SYSTEM MONITORING
- BATTERY POWERED SYSTEM

## DESCRIPTION

The RS8905 offers a wide supply range, It is a dual low power comparator with a typical power supply current of 400 nA (per channel), and rail-to-rail inputs. All of these features come in industrystandard and extremely small packages, making this device an excellent choice for low-voltage and lowpower applications for portable electronics and industrial systems.

Featuring a push-pull output stage, the RS8905 allows for operation with absolute minimum power consumption when driving any capacitive or resistive load.

The devices are ideal for system monitoring, include tablets, portable medical, smart phones. The RS8905 is specified at the full temperature range of $-40^{\circ} \mathrm{C}$ to $+125^{\circ} \mathrm{C}$ under single power supplies of 1.4 V to 5.5 V .

## SPECIFICATIONS

## Absolute Maximum Ratings

Over operating free-air temperature range (unless otherwise noted) (1)

|  |  | MIN | MAX | UNIT |
| :---: | :---: | :---: | :---: | :---: |
|  | Supply, Vs=(V+) - (V-) |  | 7 |  |
| Voltage | Input pin (IN+, IN-) ${ }^{(2)}$ | (V-)-0.5 | $(\mathrm{V}+)+0.5$ | V |
|  | Signal output pin ${ }^{(3)}$ | (V-)-0.5 | $(\mathrm{V}+)+0.5$ |  |
|  | Signal input pin (IN+, IN-) ${ }^{(2)}$ | -10 | 10 | mA |
| Current | Signal output pin ${ }^{(3)}$ | -55 | 55 | mA |
|  | Output short-circuit ${ }^{(4)}$ |  |  |  |
|  | Operating range, $\mathrm{T}_{\mathrm{A}}$ | -40 | 125 |  |
| Temperature | Junction, $\mathrm{T}_{J}$ |  | 150 | ${ }^{\circ} \mathrm{C}$ |
|  | Storage, $\mathrm{T}_{\text {stg }}$ | -65 | 150 |  |

(1) Stresses above these ratings may cause permanent damage. Exposure to absolute maximum conditions for extended periods may degrade device reliability. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those specified is not implied.
(2) Input terminals are diode-clamped to the power-supply rails. Input signals that can swing more than 0.5 V beyond the supply rails should be currentlimited to 10 mA or less.
(3) Output terminals are diode-clamped to the power-supply rails. Output signals that can swing more than 0.5 V beyond the supply rails should be current-limited to $\pm 55 \mathrm{~mA}$ or less.
(4) Short-circuit to ground, one amplifier per package.

RS8905

## TYPICAL CHARACTERISTICS

At $\mathrm{T}_{\mathrm{A}}=+25^{\circ} \mathrm{C}, \mathrm{V}=5 \mathrm{~V}, \mathrm{~V}_{\mathrm{CM}}=\mathrm{V}_{\mathrm{S}} / 2, \mathrm{C}_{\mathrm{L}}=15 \mathrm{pF}$ unless otherwise noted.

## Detailed Description

## Overview

The RS8905 devices are double-channel, Nano-power comparators with a push-pull output stage. Operating from 1.4 V to 5.5 V and consuming only 400 nA per channel. The push-pull output of the RS8905 supports rail-to-rail output swing and interfaces with TTL/CMOS logic.

## Functional Block Diagram

## Feature Description

The RS8905 devices are Nano-Power comparators that can operate at low voltages. The RS8905 feature a rail-to-rail input stage capable of operating up to 100 mV beyond the VCC power supply rail.

## Input Stage

The RS8905 has rail-to-rail input common-mode voltage range. It can operate at any differential input voltage within this limit as long as the differential voltage is greater than zero. A differential input of zero volts may result in oscillation.
The differential input stage of the comparator is a pair of PMOS and NMOS transistors, therefore, no current flows into the device. The input bias current measured is the leakage current in the MOS transistors and input protection diodes. This low bias current allows the comparator to interface with a variety of circuitry and devices with minimal concern about matching the input resistances.

## Output Stage

The RS8905 has a MOS push-pull rail-to-rail output stage. The push-pull transistor configuration of the output keeps the total system power consumption to a minimum. The only current consumed by the RS8905 is the less than $1 \mu \mathrm{~A}$ supply current and the current going directly into the load. No power is wasted through the pullup resistor when the output is low. The output stage is specifically designed with dead time between the time when one transistor is turned off and the other is turned on (break-before-make) to minimize shoot through currents. The internal logic controls the break-before-make timing of the output transistors. The break-before-make delay varies with temperature and power condition.

## Output Current

Even though the RS8905 uses less than $1 \mu \mathrm{~A}$ supply current, the outputs can drive very large currents. The RS8905 can source up to 38 mA and can sink up to 42 mA when operated at 5 V supply. This large current handling capability allows driving heavy loads directly.

## Application Information

The RS8905 is an ultra-low-power comparator with a typical power supply current of 400 nA per channel. It has the best-in class power supply current versus propagation delay. The propagation delay is as low as $9 \mu s$ with 100 mV overdrive at 1.4 V supply.

## Typical Applications

## Square Wave Generator

Figure 1. Square Wave Generator Schematic

## Design Requirements

A typical application for a comparator is as a square wave oscillator. The circuit in Figure 1 generates a square wave whose period is set by the RC time constant of the capacitor C1 and resistor R4. The maximum frequency is limited by the large signal propagation delay of the comparator and by the capacitive loading at the output, which limits the output slew rate.

## Detailed Design Procedure

Figure 2. Square Wave Oscillator

## Typical Applications(continued)

Consider the output of Figure 2 to be high to analyze the circuit. That implies that the inverted input $\left(\mathrm{V}_{\mathrm{c}}\right)$ is lower than the noninverting input $\left(\mathrm{V}_{\mathrm{A}}\right)$. This causes the $\mathrm{C}_{1}$ to be charged through $\mathrm{R}_{4}$, and the voltage $\mathrm{V}_{\mathrm{C}}$ increases until it is equal to the noninverting input. The value of $\mathrm{V}_{\mathrm{A}}$ at this point is in Equation 1.
$V_{A 1}=\frac{V_{C C} \times R_{2}}{R_{2}+R_{1} \| R_{3}}$
If $R_{1}=R_{2}=R_{3}$ then $V_{A 1}=2 V_{c c} / 3$
At this point the comparator switches pulling down the output to the negative rail. The value of $V_{A}$ at this point, as shown in Equation 2:
$V_{A 2}=\frac{V_{C C}\left(R_{2} \| R_{3}\right)}{R_{1}+\left(R_{2} \| R_{3}\right)}$
If $R_{1}=R_{2}=R_{3}$ then $V_{A 2}=V_{C C} / 3$ The capacitor $C_{1}$ now discharges through $R_{4}$, and the voltage $V_{C}$ decreases until it is equal to $\mathrm{V}_{\mathrm{A} 2}$, at which point the comparator switches again, bringing it back to the initial stage. The time period is equal to twice the time it takes to discharge $\mathrm{C}_{1}$ from $2 \mathrm{~V}_{\mathrm{cc}} / 3$ to $\mathrm{Vcc} / 3$, which is given by $\mathrm{R}_{4} \mathrm{C}_{1} \times$ In2. Hence the formula for the frequency is given by Equation 3:
$\mathrm{F}=1 /\left(2 \times \mathrm{R}_{4} \times \mathrm{C}_{1 \times} \times \ln 2\right)$.

## Application Curves

Figure 3 shows the simulated results of an oscillator using the following values:

1. $R_{1}=R_{2}=R_{3}=R_{4}=100 \mathrm{k} \Omega$
2. $\mathrm{C}_{1}=100 \mathrm{pF}, \mathrm{CL}_{\mathrm{L}}=20 \mathrm{pF}$
3. $\mathrm{V}_{+}=5 \mathrm{~V}, \mathrm{~V}_{-}=\mathrm{GND}$
4. Cstray (not shown) from Va to GND $=10 \mathrm{pF}$
