■ II类陶瓷介质电容器容量衰减特性

Ceramic Dielectric Capacitor Capacitance Attenuation Characteristic (Type II)

II类陶瓷介质（包括X7R、X5R及Y5V特性类）的电容器使用的是铁电体材料。当温度低于居里温度时，介质的立方晶体结构转为四方相，其对称性降低，晶体点阵中的离子会连续移动到势能较小的位置，引起电容量按对数规律随时间不断地减小，这一现象称为II类陶瓷介质材料的老化现象。

Ceramic dielectric (including X7R, X5R and Y5V characteristic types) capacitors use a ferroelectric material. When the temperature is below the Curie temperature, the cubic crystal structure of the dielectric changes to the tetragonal phase, which reduce the symmetry. Crystal lattice ions will continuously move to a smaller location potential, which causes capacitance logarithmically reduced by time, and this phenomenon is called aging of Type II ceramic dielectric material.

■ MLCC容量衰减特性 MLCC Capacitance Attenuation Characteristic

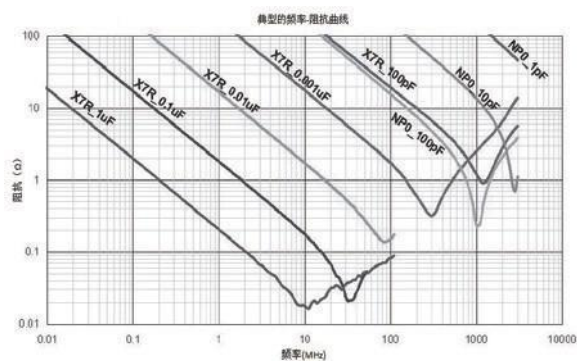

上述现象是可逆的，如果将电容器加热至高于居里温度的某一温度（160℃）后容量就可以恢复到初始值。故电容贴在PCB板上过炉焊接时，电容容值就会恢复到初始值。

The above phenomenon is reversible, if the capacitor is heated to a temperature above the Curie temperature (160 °C) after the capacity can be restored to the initial value. Therefore, when the capacitor attached to the PCB board is being soldering, the value of capacitance will return to the initial.
