### Introduction

Exceeding the operating limits of an electric motor will lead, eventually, not only to destruction of the motor itself but also of the mechanisms it drives.

This type of load can be the cause of electrical or mechanical faults.

■ **Electrical faults:**

- overvoltage, voltage drop, imbalance and phase failure which cause variations in the current drawn,
- short-circuits which can cause the current to reach levels capable of destroying the load.

■ **Mechanical faults:**

- locked rotor,
- brief or prolonged overload which leads to an increase in the current drawn by the motor, and therefore overheating.

The cost of these faults must take into account loss of production, loss of raw materials, repair of the production tool, poor quality of production and delays in delivery.

These faults can also have dramatic consequences on the safety of persons in direct or indirect contact with the motor.

To prevent these faults, protection measures are necessary. They make it possible to isolate the equipment to be protected from the mains supply by measuring variations in electrical values (voltage, current, etc...).

**Each motor starter must therefore have:**

■ **short-circuit protection**, to detect and break, as quickly as possible, abnormal currents generally greater than 10 times the rated current ( $I_n$ ).

■ **overload protection**, to detect increases in current up to about  $10 I_n$  and switch off the starter before overheating of the motor and conductors damages the insulation.

This protection is provided by specific devices such as fuses, circuit-breakers and thermal overload relays, or by more integrated devices offering several types of protection.

### Causes, effects and consequences of various faults

There are two types of fault:

- Internal faults within the motor.
- External faults: these are located outside the electric motor but their consequences can lead to damage inside the motor.

Faults	Causes	Effects	Consequences on the motor and on the machine
<b>Short-circuit</b>	Contact between several phases, or between one phase and neutral or between several turns of the same phase.	<ul style="list-style-type: none"> <li>■ Current peak</li> <li>■ Electrodynamical forces on the conductors</li> </ul>	Destruction of windings
<b>Overvoltage</b>	<ul style="list-style-type: none"> <li>■ Lightning</li> <li>■ Electrostatic discharge</li> <li>■ Operation</li> </ul>	Dielectric breakdown in the windings	Destruction of the windings due to loss of insulation
<b>Phase imbalance and phase failure</b>	<ul style="list-style-type: none"> <li>■ Opening of a phase</li> <li>■ Single-phase load upstream of the motor</li> <li>■ Short-circuit between the turns of the same winding</li> </ul>	<ul style="list-style-type: none"> <li>■ Reduction of usable torque, efficiency and speed</li> <li>■ Increase in losses</li> <li>■ Starting impossible if phase failure</li> </ul>	Overheating (1)
<b>High starting frequency</b>	<ul style="list-style-type: none"> <li>■ Failure of the automation system</li> <li>■ Too many manual control operations</li> <li>■ Numerous fault trips</li> </ul>	High stator and rotor temperature rise due to the frequent start current	Overheating (1) Consequences on the process
<b>Voltage variations</b>	<ul style="list-style-type: none"> <li>■ Instability of the mains voltage</li> <li>■ Connection of heavy loads</li> </ul>	<ul style="list-style-type: none"> <li>■ Reduction of usable torque</li> <li>■ Increase in losses</li> </ul>	Overheating (1)
<b>Harmonics</b>	■ Pollution of the mains supply by variable speed drives, inverters, etc...	<ul style="list-style-type: none"> <li>■ Reduction of usable torque</li> <li>■ Increase in losses</li> </ul>	Overheating (1)
<b>Long starting time</b>	<ul style="list-style-type: none"> <li>■ Resistive torque too high (load too heavy)</li> <li>■ Voltage drop</li> </ul>	Increase in starting time	Overheating (1)
<b>Jamming</b>	<ul style="list-style-type: none"> <li>■ Mechanical problem (crusher)</li> <li>■ Seizures</li> </ul>	Overcurrent	Overheating (1) Consequences on the process
<b>No-load running</b>	<ul style="list-style-type: none"> <li>■ Pump running empty</li> <li>■ Mechanical break in drive to the load</li> </ul>	Drop in current drawn	Consequences on the process
<b>Frequency fluctuations</b>	<ul style="list-style-type: none"> <li>■ Overload of a supply powered by limited independent sources</li> <li>■ Faulty alternator speed regulator</li> </ul>	<ul style="list-style-type: none"> <li>■ Increase in losses</li> <li>■ Interferes with synchronous devices (clock, recorder, ...)</li> </ul>	–
<b>Overload</b>	<ul style="list-style-type: none"> <li>■ Increase in resistive torque</li> <li>■ Voltage drop</li> <li>■ Drop in power factor</li> </ul>	Increase in current consumption	Overheating (1)
<b>Loss of machine excitation</b>	<ul style="list-style-type: none"> <li>■ Significant drop in excitation current</li> <li>■ Break in rotor winding</li> </ul>	<ul style="list-style-type: none"> <li>■ Increase in active power</li> <li>■ Drop in power factor</li> </ul>	Significant overheating of rotor and cage
<b>Phase-Earth fault</b>	<ul style="list-style-type: none"> <li>■ Accidental Phase-Earth contacts</li> <li>■ Accidental Phase-machine casing contacts (casing connected to earth)</li> </ul>	<ul style="list-style-type: none"> <li>■ Overvoltage developed in the mains supply</li> <li>■ Rise in earth potential (safety of persons)</li> </ul>	Consequences on safety of persons

(1) Then, in the longer or shorter term, depending on the seriousness of the fault and/or its frequency, short-circuit and destruction of the windings.

### Protection functions

#### Short-circuit protection

##### General

A short-circuit results in a very rapid rise in current which can reach several hundred times the value of the operational current. The consequences of a short-circuit are dangerous to both equipment and persons. It is therefore imperative to use protection devices to detect the fault and very quickly break the circuit.

Two types of protection are commonly used:

- fuses (cutout) which break the circuit by melting, which then requires their replacement,
- magnetic trip circuit-breakers, often more simply called "magnetic circuit-breakers", which only require re-setting to put them back into service.

Short-circuit protection can also be built-into multifunction devices such as motor circuit-breakers and contactor-breakers.

The main characteristics of short-circuit protection devices are:

- their breaking capacity: this is the highest prospective short-circuit current value that a protection device can break at a given voltage.
- their making capacity: this is the highest current value that the protection device can make at its rated voltage in specified conditions.

The making capacity is equal to  $k$  times the breaking capacity.

LS1 D32  
fuse carrier

GS2 N3  
switch disconnectors

#### Fuses (cutouts)

Fuses provide individual phase protection (single-pole), with a high breaking capacity in a compact size:

- mounted either in fuse carriers,
- or in isolators, replacing the original links or shunt bars.

For motor protection, aM type fuses are used. Their design characteristics allow them to conduct the high magnetising currents that occur when motors are switched on. They are therefore unsuitable for overload protection (unlike gG type fuses). This is why an overload relay must be included in the motor power supply circuit.

#### Magnetic circuit-breakers

These circuit-breakers protect installations against short-circuits, within the limit of their breaking capacity.

Magnetic circuit-breakers provide omnipole breaking as standard.

For relatively low short-circuit currents, the operation of a circuit-breaker is faster than that of fuses.

This protection conforms to standard IEC 60947-2.

The thermal and electrodynamic effects are also limited, therefore ensuring better protection of cables and equipment.

### Protection functions (continued)

#### Overload protection

##### General

An overload condition is the most frequently encountered fault. The symptoms are a rise in the current drawn by the motor and thermal effects. A rapid return to normal operating conditions is important.

The actual operating conditions (ambient temperature, operating altitude and type of standard duty) are essential to determine the operating values of the motor (power, current) and to be able to select effective overload protection. These operational values are given by the motor manufacturer.

According to the level required, protection can be provided by:

- overload relays and thermal overload relays (bi-metallic or electronic type) which protect motors in the event of:
  - overload, by monitoring the current drawn by each phase,
  - phase imbalance or failure, by their differential mechanism.
- relays with PTC thermistor probes (Positive Temperature Coefficient).
- overtorque relays,
- multifunction relays.

#### Overload relays

These relays protect motors against overload. They must allow the temporary overload that occurs on starting and must only trip if the starting time is abnormally long.

The overload relay will be selected according to the length of the starting time (tripping class) and the motor rating.

These relays have a thermal memory (except for certain electronic overload relays, indicated by their manufacturers) and can be connected:

- either in series with the load,
- or to current transformers placed in series with the load.

#### Bi-metallic thermal overload relays

Combined with a contactor, these relays protect the line and the equipment against small and prolonged overloads. They must be protected against strong overcurrent by a circuit-breaker or fuses.

These relays may be used on an a.c. or d.c. system and are generally:

- 3-pole,
- compensated, i.e. insensitive to ambient temperature variations,
- with manual or automatic reset,
- graduated with a "motor FLC" scale: allowing direct setting to the full load current as shown on the motor rating plate.

They can also be sensitive to phase failure: this is known as 'differential'. This function conforms to standards IEC 60947-4-1 and 60947-6-2

This type of relay is extremely reliable and is a relatively low cost device.

#### Electronic thermal overload relays

Electronic thermal overload relays have the advantage of electronics which allow a more complex thermal image of the motor to be created.

They can be combined with products having complementary functions, such as:

- temperature sensing via PTC probes,
- protection against jamming and overtorque,
- protection against phase reversal,
- earth fault protection,
- protection against no-load running,
- alarm function.

LT3 S relays for use with thermistor probes

LR97 D07 instantaneous electronic overcurrent relays

TeSys U LUB 32 starter with multifunction control unit LUC M

TeSys U controller LUTM 20BL

TeSys T controller LTM R08MBD

### Protection functions (continued)

#### Overload protection (continued)

##### Relays for use with PTC thermistor probes

With direct sensing of the stator windings, these relays can be used to protect motors against:

- overload,
- a rise in ambient temperature,
- a ventilation circuit fault,
- a high starting frequency,
- mechanical shocks, etc...

#### Overload (or overtorque) relays

These relays protect the drive line in the event of a locked rotor, seizure or mechanical shocks. This is an additional protection.

Unlike thermal overload relays, these relays do not have a thermal memory. They have definite time characteristics (adjustable current threshold and time delay).

The overtorque relay can be used as overload protection for motors with long starting times or very frequent starting (for example, lifting hoists).

#### Multifunction relays

■ Overcurrent relays are limited when it is necessary to take into account problems associated with voltage, temperature or special applications. New production or maintenance management needs have prompted manufacturers to offer products which provide not only adaptable protection, but also complete management of the motor and its load.

They incorporate:

- current and voltage sensors (TeSys T controllers),
- hybrid analog and digital electronic technology,
- the use of communication buses for data exchange and control,
- powerful motor modelling algorithms,
- integrated application programs whose parameters can be set.

These products make it possible to reduce installation and operating costs by reducing maintenance and downtime.

#### TeSys U starters:

The multifunction relay is incorporated in the motor starter.

This solution is very compact with reduced wiring. It is limited to 32 A.

#### TeSys U controllers:

The multifunction relay is separate from the power line and reuses the function blocks from the TeSys U solution. It can be used in conjunction with a contactor up to 810 A.

#### TeSys T controllers:

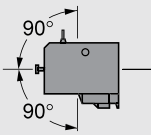

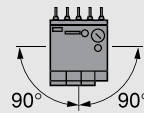

The multifunction relay is separate from the power line and incorporates inputs and outputs. It can be used in conjunction with a contactor up to 810 A.

Protection relay selection table

<b>Reset-Stop function</b>			Pressing the Reset-Stop button : - actuates the N/C contact - has no effect on the N/O contact
<b>Test function</b>	By pushbutton		Pressing the Test button enables : - checking of the control circuit wiring - simulation of overload tripping (actuation of both N/C and N/O contacts, and of the trip indicator)
<b>Short-circuit protection and coordination</b>			See pages 1/18 and 1/28

## Tripping curves

### Average operating time related to multiples of the current setting (Class 10 A)

Balanced 3-phase operation, from cold state

Balanced operation with 2 phases only, from cold state

- 1 Setting : at lower end of scale
- 2 Setting : at upper end of scale

# TeSys protection components

TeSys K thermal overload relays, adjustable from 0.11 to 16 A

### 3-pole relays with screw clamp terminals

These overload relays are designed for the protection of motors. They are compensated and phase failure sensitive. Resetting can either be manual or automatic.

Direct mounting: under the contactor for versions with screw clamp terminals only; pre-wired terminals, see pages 6/10 and 6/13.

Separate mounting: using terminal block LA7 K0064 (see below).

On the front face of the overload relay:

- selection of reset mode: Manual (marked H) or Automatic (marked A),
- red pushbutton: Trip Test function,
- blue pushbutton: Stop and manual Reset,
- yellow trip flag indicator: overload relay tripped.

Protection by magnetic circuit-breaker GV2 LE, see pages 1/18 and 1/28.

### Class 10 A (the standard specifies a tripping time of between 2 and 10 seconds at 7.2 In)

Relay setting range	Fuses to be used with selected relay			Reference	Weight
	Maximum rating				
	aM	gG	BS88		
A	A	A	A		kg
0.11...0.16	0.25	0.5	–	LR2 K0301	0.145
0.16...0.23	0.25	0.5	–	LR2 K0302	0.145

### Presentation

LRD 08

LRD 365

LRD 3300

TeSys D thermal overload relays are designed to protect a.c. circuits and motors against:

- overloads,
- phase failure,
- excessively long starting times,
- prolonged stalled rotor condition.

#### Power connection

##### LRD 01 to LRD 35

LRD 01 to 35 relays are designed for connection by screw clamp terminals. They can be supplied for connection by spring terminals or by lugs (1).

##### LRD 313 to LRD 365

LRD 313 to 365 relays are for connection by BTR screw connectors (hexagon socket head).

The screws are tightened by means of a size 4, insulated Allen key.

This type of connection uses the **EverLink®** system with creep compensation (2) (Schneider Electric patent).

This technique makes it possible to achieve accurate and durable tightening torque.

These relays are also available for connection by lugs (1).

##### LRD 3361 to 4369, LR2 D3561 to D3563

LRD 3361 to 4369 and LR2 D3561 to D3563 relays are designed for connection by screw clamp terminals. They can be supplied for connection by lugs (1).

6

### Description

LRD 01...35 and LRD 313...LRD 365

LRD 3361...4369, LR2 D3561...3563

TeSys D 3-pole thermal overload relays are designed to protect a.c. circuits and motors against overloads, phase failure, long starting times and prolonged stalling of the motor.

- 1 Adjustment dial Ir.
- 2 Test button.  
Operation of the Test button allows:
  - checking of control circuit wiring,
  - simulation of relay tripping (actuates both the N/O and N/C contacts).
- 3 Stop button. Actuates the N/C contact; does not affect the N/O contact.
- 4 Reset button.
- 5 Trip indicator.
- 6 Setting locked by sealing the cover.
- 7 Selector for manual or automatic reset.

LRD 01 to 35 and LRD 313 to LRD 365 relays are supplied with the selector in the manual position, protected by a cover. Deliberate action is required to move it to the automatic position.

(1) Connection by lugs meets the requirements of certain Asian markets and is suitable for applications subject to strong vibration, such as railway transport.

(2) Creep: normal crushing phenomenon of copper conductors, that is accentuated over time.

Environment			
Conforming to standards			IEC/EN 60947-4-1, IEC/EN 60947-5-1, UL 508, CSA C22.2 n° 14. ATEX directive 94/9/EC (1)
Product certifications			UL, CSA, CCC, GOST ATEX INERIS (1). GL, DNV, RINA, BV, LROS (2).
Degree of protection	Conforming to VDE 0106		Protection against direct finger contact IP 2X
Protective treatment	Conforming to IEC 60068		"TH"
Ambient air temperature around the device	Storage	°C	- 60...+ 70
	Normal operation, without derating (IEC 60947-4-1)	°C	- 20...+ 60
	Minimum /maximum operating temperatures (with derating)	°C	- 40...+ 70
Operating positions without derating	In relation to normal vertical mounting plane		Any position. When mounting on a vertical rail, use a stop.
Flame resistance	Conforming to UL 94		V1
	Conforming to IEC 60695-2-1	°C	850
Shock resistance	Permissible acceleration conforming to IEC 60068-2-7		15 gn - 11 ms
Vibration resistance (3)	Permissible acceleration conforming to IEC 60068-2-6		6 gn
Dielectric strength at 50 Hz	Conforming to IEC 60255-5	kV	6
Surge withstand	Conforming to IEC 60801-5	kV	6

(1) For relays LRD 313 to 365: BTR hexagon socket head screws, EverLink® system. In accordance with local electrical wiring regulations, a size 4 insulated Allen key must be used (reference LAD ALLEN4, see page 5/85).

### Operating characteristics

Relay type	LRD 01 ...16, LR3 D01 ...16	LRD 1508 ... 1532	LRD 21 ...35, LR3 D21 ...35	LRD 313 ...365 LR3 D313 ...365	LRD 313L ...365L	LRD 3322 ...33696 LR3 D3322 ... 33696	LR2 D3522 ... 3563	LRD 4365 ...4369
Temperature compensation	°C		- 20...+ 60					
Tripping threshold	Conforming to IEC 60947-4-1	A		1.14 ± 0.06 Ir				
Sensitivity to phase failure	Conforming to IEC 60947-4-1	Tripping current I 30 % of Ir on one phase, the others at Ir.						

### Tripping curves

Average operating time related to multiples of the setting current

LRD 01 to LRD 35, LR2 D and LRD 3322 to LRD 4369

LRD 1508 to LRD 32 and LR2 D3522 to LR2 D3563

LRD 313 to LRD 365

LRD 313L to LRD 365L

- 1 Balanced operation, 3-phase, without prior current flow (cold state).
- 2 2-phase operation, without prior current flow (cold state).
- 3 Balanced operation, 3-phase, after a long period at the set current (hot state).

### Description

LR9 D5367...D5569

LR9 D67 and D69

LR9 D electronic thermal overload relays are designed for use with contactors LC1 D115 and D150.

In addition to the protection provided by TeSys D thermal overload relays (see page 6/14), they offer the following special features:

- protection against phase imbalance,
- choice of starting class,
- protection of unbalanced circuits,
- protection of single-phase circuits,
- alarm function to avoid tripping by load shedding.

- 1 Adjustment dial  $I_r$ .
- 2 Test button.
- 3 Stop button.
- 4 Reset button.
- 5 Trip indicator.
- 6 Setting locked by sealing the cover.
- 7 Class 10/class 20 selector switch.
- 8 Selector for balanced load / unbalanced load

### Environment

<b>Conforming to standards</b>		IEC 60947-4-1, 255-8, 255-17, VDE 0660 and EN 60947-4-1	
<b>Product certifications</b>		UL 508, CSA 22-2	
<b>Degree of protection</b>	Conforming to IEC 60529 and VDE 0106	IP 20 on front panel with protective covers <b>LA9 D11570●</b> or <b>D11560●</b>	
<b>Protective treatment</b>	Standard version	"TH"	
<b>Ambient air temperature around the device</b> (Conforming to IEC 60255-8)	Storage	°C	- 40...+ 85
	Normal operation	°C	- 20...+ 55 (1)
<b>Maximum operating altitude</b>	Without derating	m	2000
<b>Operating positions without derating</b>	In relation to normal vertical mounting plane	Any position	
<b>Shock resistance</b>	Permissible acceleration conforming to IEC 60068-2-7	13 gn - 11 ms	
<b>Vibration resistance</b>	Permissible acceleration conforming to IEC 60068-2-6	2 gn - 5...300 Hz	
<b>Dielectric strength at 50 Hz</b>	Conforming to IEC 60255-5	kV	6
<b>Surge withstand</b>	Conforming to IEC 61000-4-5	kV	6
<b>Resistance to electrostatic discharge</b>	Conforming to IEC 61000-4-2	kV	8
<b>Immunity to radiated radio-frequency disturbances</b>	Conforming to IEC 61000-4-3 and NF C 46-022	V/m	10
<b>Immunity to fast transient currents</b>	Conforming to IEC 61000-4-4	kV	2
<b>Electromagnetic compatibility</b>	Draft EN 50081-1 and 2, EN 50082-2	Meets requirements	

### Electrical characteristics of auxiliary contacts

### Class 10 A (1) for connection by lugs

Select the appropriate overload relay with screw clamp terminals or connectors from the table above and add one of the following suffixes:

- figure 6 for relays LRD 01 to LRD 35 and relays LRD 313 to LRD 365.
- A66 for relays LRD 3322 to LRD 3365.

Relays LRD 43●● are suitable, as standard, for use with lug-clamps.

### Thermal overload relays for use with unbalanced loads

#### Class 10 A (1) for connection by screw clamp terminals or lugs

In the references selected above, change the prefix LRD (except LRD 4●●●) to LR3 D.

Example: **LRD 01** becomes **LR3 D01**.

Example with EverLink® connectors: **LRD 340** becomes **LR3 D340**.

Example with lugs: **LRD 3406** becomes **LR3 D3406**.

(1) Standard IEC 60947-4-1 specifies a tripping time for 7.2 times the setting current  $I_R$  :

class 10 A: between 2 and 10 seconds

(2) Independent mounting of the contactor.

(3) BTR screws: hexagon socket head. In accordance with local electrical wiring regulations, a size 4 insulated Allen key must be used (reference LAD ALLEN4, see page 5/85).

### Remote control

#### "Reset" function

Description	For use with	Sold in lots of	Unit reference	Weight kg
<b>By flexible cable</b> (length = 0.5 m)	LRD 01...35, LR3 D01...D35 and LRD 313...LRD 365	1	LAD 7305 (7)	0.075
	All relays except LRD 01...35, LR3 D01...D35, LRD 3●●, LRD 3●●L and LR3 D3●●	1	LA7 D305	0.075

#### "Stop" and/or "Reset" functions

The terminal protection shroud must be removed and the following 3 products must be ordered separately:

<b>Adapter for door mounting</b>	LRD 33●●, LR2 D and LRD 15●●.	1	LA7 D1020	0.005	
<b>Operating heads</b> for spring return pushbutton	Stop	All relays	1	XB5 AL84101	0.027
	Reset	All relays	1	XB5 AA86102	0.027

- (1) These pre-wiring kits cannot be used with reversing contactors.
- (2) Terminal blocks are supplied with terminals protected against direct finger contact and screws in the open, "ready-to-tighten" position.
- (3) To order a terminal block for connection by lugs, the reference becomes **LA7 D30646**.
- (4) Remember to order the terminal block corresponding to the type of relay.
- (5) The time for which the coil of remote tripping or electrical resetting device **LA7 D03** or **LAD 703** can remain energised depends on its rest time: 1 s pulse duration with 9 s rest time; 5 s pulse duration with 30 s rest time; 10 s pulse duration with 90 s rest time; maximum pulse duration 20 s with a rest time of 300 s. Minimum pulse time: 200 ms.
- (6) Reference to be completed by adding the code indicating the control circuit voltage.  
Standard control circuit voltages (for other voltages, please consult your Regional Sales Office) :

Volts	12	24	48	96	110	220/230	380/400	415/440
50/60 Hz	—	B	E	—	F	M	Q	N
Consumption, inrush and sealed: < 100 VA	—	J	B	E	DD	F	M	—

Consumption, inrush and sealed: < 100 W.

(7) Not compatible with 3-pole relays fitted with spring terminals.

# TeSys protection components

## 3-pole electronic thermal overload relays, TeSys LR9 F

### Presentation

TeSys LR9 F electronic protection relays are especially suited to the operating conditions of motors.

They provide protection against:

- thermal overload of 3-phase or single-phase balanced or unbalanced circuits;
- phase failure and large phase unbalance,
- protracted starting times,
- prolonged stalled rotor condition.

LR9 F electronic protection relays are mounted directly below an LC1 F type contactor. They cover a range from 30 to 630 A, in eight ratings.

The settings can be locked by sealing the transparent protective cover.

A reset button is mounted on the front of the relay.

Two versions are available:

- simplified version: class 10: LR9 F●3●●, class 20: LR9 F●5●●,
- complete version: class 10, 10 A or class 20, selectable, conforming to EN 60947-4-1: LR9 F●●.

This latter version includes an alarm function which makes it possible to forestall tripping by load shedding.

### Simplified version: class 10 or 20

### Complete version: class 10, 10 A or class 20, selectable, and alarm circuit

- 1 Ir adjustment dial
- 2 Test button
- 3 Stop button
- 4 Reset button
- 5 Trip indicator
- 6 Setting locked by sealing the cover
- 7 Class 10/class 20 selector switch
- 8 Selector switch for balanced load  /unbalanced load 
- 9 Alarm circuit

Environment			
<b>Conforming to standards</b>			IEC 60947-4-1, IEC 60255-8, IEC 60255-17, EN 60947-4-1 and VDE 0660
<b>Product certifications</b>			UL 508, CSA 22-2
<b>Degree of protection</b>	Conforming to VDE 0106		IP 20
	Conforming to IEC 60529		IP 20 on front of relay with accessories <b>LA9 F103</b> or <b>LA7 F70</b> , see page 6/37
<b>Protective treatment</b>	Standard version		"TH"
<b>Ambient air temperature around the device</b> (conforming to IEC 60255-8)	Storage	°C	- 40...+ 85
	Normal operation	°C	- 20...+ 55 (1)
<b>Maximum operating altitude</b>	Without derating	m	2000
<b>Operating positions without derating</b>	In relation to normal vertical mounting plane		Any position
<b>Shock resistance</b>	Permissible acceleration conforming to IEC 60068-2-7		13 gn - 11 ms
<b>Vibration resistance</b>	Permissible acceleration conforming to IEC 60068-2-6		2 gn - 5 to 300 Hz
<b>Dielectric strength at 50 Hz</b>	Conforming to IEC 255-5	kV	6
<b>Surge withstand</b>	Conforming to IEC 61000-4-5	kV	4
<b>Resistance to electrostatic discharge</b>	Conforming to IEC 61000-4-2	kV	8 (in air) 6 (in indirect mode)
<b>Resistance to radiated radio-frequency disturbance</b>	Conforming to IEC 61000-4-3	V/m	10
<b>Resistance to fast transient currents</b>	Conforming to IEC 61000-4-4	kV	2
<b>Electromagnetic compatibility</b>	EN 50081-1 and 2, EN 50082-2		Conforming

(1) For operating temperatures up to 70 °C, please consult your Regional Sales Office.

380...630	630	800	F400...F630 and F800	LR9 F7581	4.160

(1) When mounting overload relays up to size LR9 F5371 directly beneath the contactor, they may be additionally supported by a mounting plate (see page 6/37). Above this size it is always necessary to use the mounting plate.

Power terminals can be protected against direct finger contact by the addition of shrouds and/or insulated terminal blocks, to be ordered separately (see page 6/37).

(2) Standard IEC 60947-4 specifies a tripping time for 7.2 times the setting current  $I_n$ :

- class 10: between 4 and 10 seconds,
- class 20: between 6 and 20 seconds.

# TeSys protection components

## 3-pole electronic thermal overload relays, TeSys LR9 F for motor protection

### Compensated overload relays, class 10 or 20 with alarm

Thermal overload relays:

- compensated,
- with relay trip indicator,
- for a.c.,
- for direct mounting on contactor or independent mounting (1),
- class 10 or 20 by selector switch,
- protection of 3-phase or single-phase circuits by selector switch,
- with alarm function that enables tripping to be forestalled.

(1) When mounting overload relays up to size **LR9 F71** directly beneath the contactor, they may be additionally supported by a mounting plate (see page 6/37). Above this size it is always necessary to use the mounting plate.  
Power terminals can be protected against direct finger contact by the addition of shrouds and/or insulated terminal blocks, to be ordered separately (see page 6/37).

### Schemes

#### LR9 F5...F7...F81

#### LR9 F57...F81 (with alarm)

- (1) Tripped on thermal overload
- (2) Overheating alarm
- (3) Setting current
- (4) Specialised circuit

### Setting-up the special functions of TeSys LR9 F thermal overload relays

#### Setting the relay

- Lift the transparent cover 7 to gain access to the various settings.
- Adjustment is achieved by turning dial 1 which is graduated directly in Amperes.
- The setting can be locked by sealing the cover 7.

#### “Stop” function 3

##### Stop

- The “Stop” function is obtained by pressing the red “STOP” button 3.
- Pressing the Test button:
  - actuates the N/C contact,
  - has no effect on the N/O contact.
- The “STOP” button can be locked by fitting a “U” clip (reference: LA7 D901).

#### “Test” function 2

##### Test

- The “Test” function is obtained by pressing the red “TEST” button 2 with a screwdriver.
- Operation of the “TEST” button simulates tripping of the relay and:
  - actuates both the N/O and N/C contacts,
  - actuates the trip indicator 5.

##### Trip indicator

### Presentation

The RM1 XA electromagnetic relay detects over current peaks in excess of the maximum permissible current value. It is designed for the protection of circuits which are not subject to current peaks (starters, resistors) or for controlling starting peaks on slip ring motors.

It trips instantaneously and is not suitable for frequent operation (12 operating cycles per hour). It can withstand a continuous current equivalent to 1.25 times the minimum setting current.

### Environment characteristics

Conforming to standards		Standard version NF C 63-650, VDE 0660
Approvals		CSA
Protective treatment		Standard version "TC", special version "TH"
Ambient air temperature around the device	°C	Storage: - 60...+ 70 Operation: - 40...+ 60
Maximum operating altitude	m	3000
Operating position		± 15° in relation to normal vertical mounting position

### Electrical characteristics of power circuit

Maximum rated operational voltage	V	~ or ≡ 600
Frequency limits of the rated operational current	Hz	0...60

### Electrical characteristics of auxiliary contacts

Conventional thermal current	A	10						
Occasional making and breaking capacities	a.c. supply	Voltage	V	48	110	220	380	600
		Power (1)	VA	4000	12 000	17 000	22 000	–
	d.c. supply	Voltage	V	48	110	220	440	600
		Power (2)	W	240	200	190	180	180

(1) Circuit such as the electromagnet of a contactor -  $\cos \varphi$  inrush: 0.7 and  $\cos \varphi$  sealed: 0.4.  
(2) Circuit such as an electromagnet without economy resistor ; time constant varying from 20 ms for 5 W to 200 ms for 100 W or more.

### Operating times

Operating times: because of the numerous applications for RM1 XA over current relays, it is not possible to give precise operating times. The curves shown are therefore purely indicative.

# TeSys protection components

## Thermistor protection units for use with PTC thermistor probes <sup>(1)</sup>

### Application

LT3 S● thermistor protection units continuously monitor the temperature of the machines to be protected (motors, generators, etc.) by means of PTC thermistor probes embedded in the machine windings.

If the nominal operating temperature of the probes is reached, they convert the rapid increase in resistance into a switching function which can be used to switch off the machine or signal a fault (see paragraph relating to thermistor probes below).

Accidental breaks in the supply circuits of the thermistors are also detected.

### Electromagnetic compatibility

Conforming to "Electromagnetic compatibility" directive.  
Conforming to standard EN 61000-6-2.

Resistance to electrostatic discharge (conforming to IEC 61000-4-2)	Level 3
Resistance to fast transients (conforming to IEC 61000-4-4)	Level 3
Susceptibility to electromagnetic fields (conforming to IEC 61000-4-3)	Level 3
Surge resistance 1.2/50 - 8/20 (conforming to IEC 61000-4.5)	Level 4
Immunity to microbreaks and voltage drops (IEC 61000-4-11)	
Suitable for use with variable speed controllers	

### Thermistor probes

Range of most commonly used PTC thermistor probes:  
from 90 to 160 °C, in steps of 10 °C.

Curve  $R = f(\theta)$ , characteristic of a PTC thermistor probe, is defined by standard IEC 60947-8.

The choice of PTC thermistor probe to be incorporated in the motor winding depends on the insulation class, the type of motor and the most suitable location for the probe. This choice is usually made by the motor manufacturer or the motor rewinder, who have all the necessary information.

### Application example

Insulation class of rotating machines conforming to IEC 60034-11 (S1 duty)	NOT Nominal operating temperature	Temperature at which rapid increase in resistance occurs	
	°C	Probes used for Alarm °C	Fault °C
A	100	100	100
B	110	110	120
E	120	120	130

### Setting-up

#### Cabling

It is inadvisable to use the same multi-core cable for the thermistor probe circuit and the power circuit. This is especially important for long cable runs. If it is impossible to comply with the above recommendation, a pair of twisted conductors must be used for the thermistor probe circuit.

#### Testing the insulation of the line connecting the thermistors to the LT3 S unit

Before carrying out this test, short-circuit all the terminals of the LT3 S protection unit. Measure the insulation value between these terminals and earth using a megger or a flash tester, progressively increasing the voltage to the value defined by the standards.

#### Checking the PTC thermistor probes for correct operation

- With the machine stopped, in the cold state and after having taken all the necessary safety precautions:
- disconnect the line linking the thermistors to the LT3 S protection unit, at the terminals of the machine being protected: motor, etc.,
  - using an ohmmeter with a voltage rating less than or equal to 2.5 V, measure the resistance of the probe circuit at the machine terminals,
  - depending on the number and type of thermistors connected in series, check that their resistance value at 25 °C is correct.

Example: motor fitted with 3 PTC thermistor probes with a resistance  $\leq 250 \Omega$  at 25 °C. Any value higher than  $250 \times 3 = 750 \Omega$  indicates a problem.

(1) PTC: Positive Temperature Coefficient  
(2) Relay energised: the contacts are shown in the "operating" position.

# TeSys protection components

## Thermistor protection units for use with PTC thermistor probes (1)

### LT3 SA protection units

#### Starting

The LT3 SA is normally energised and its internal relay is in the pre-energised position. The motor is started by operating pushbutton M automatically held in by K (3-wire control circuit).

#### Thermal fault

The strong increase in resistance of the PTC probes at the moment their temperature reaches the nominal operating temperature (NOT) is detected by the LT3 SA unit and causes the relay to drop out; indicator H comes on, as does the built-in indicator on unit LT3 SA. Contactor K drops out and pressing button M has no effect.

#### Reset

As the motor cools, it reaches the reset threshold, 2 to 3°C below the nominal operating temperature. The relay resets and the motor can be started by pressing button M.

### LT3 SM protection units

Operation is very similar to that described above, except for the following:

#### Reset

After tripping on thermal fault and cooling to the reset threshold, the Test/RESET button on the unit (R1) or a remote reset button (Rd) must be pressed to energise the relay.

The fault is therefore memorised, even though the temperature of the probes has dropped to well below the reset threshold.

#### Signalling circuit

As the relay is fitted with 2 separate contacts, the signalling voltage may be different from the contactor control voltage.

#### Test

Pressing the Test/RESET button simulates a fault and causes the relay to drop out: the FAULT indicator comes on, as does the remote signalling indicator. The unit is reset by pressing the Test/RESET button again.

(1) PTC: Positive Temperature Coefficient

### Presentation

LR97 D

LT47

LR97 D and LT47 electronic over current relays have been developed to satisfy machine protection requirements. These relays have definite time characteristics: current threshold and time based function. They are particularly recommended for providing mechanical protection on machines with high resistive torque, high inertia and with strong probability of jamming under steady state conditions. They can be used for motor protection in the case of long starting times or frequent starting. The LR97 D relay also incorporates two fixed time protection functions, one of 0.5 seconds against locked rotor and one of 3 seconds against phase failure. LR97 D and LT47 can be used to provide mechanical shock protection. In this case, setting the O-Time knob to minimum will ensure tripping in 0.3 seconds.

### Applications

LR97 D and LT47 relays are particularly suitable for the following machines:

- Monitoring function for excessively long starting time on machines with a risk of difficult starting:
  - Machines with high resistive torque, high inertia machines.
- Monitoring of machines during steady state operation: overtorque detection function
  - Machines with strong risk of jamming, machines with torque build-up over time,
  - Mechanical failure monitoring,
  - Faster detection of malfunctioning on machines where the motor is oversized in relation to its thermal protection I<sup>2</sup>t.
- Motor protection for specific applications:
  - Machines with long starting times,
  - Machines with high on-load factor: more than 30 to 50 starts/hour,
  - Machine with fluctuating load from a steady state, where the thermal image of a thermal overload relay (thermal memory) is unsuitable in relation to actual overheating of the motor.

### Examples of machines:

- Conveyors, crushers and mixers,
- Fans, pumps and compressors,
- Centrifuges and spin-dryers,
- Presses, shearing machines, saws, broaching machines, sanders and lifting hoists.

### Operation

Because of their two separate time settings, LR97 D and LT47 relays can be combined with the motor-starter function:

D-Time: starting time, O-Time: trip time during steady state.

The D-Time function is only available during the motor starting phase. During this phase the overload detection function is inhibited in order to allow starting. Under steady state conditions, when the motor current is greater than the setting current due to an overload or single-phasing, the red LED lights up and the internal relay switches its contact after a time preset by the O-Time knob.

The red LED stays on, indicating that the relay has tripped.

The relays are simple to set, in 5 easy steps:

- Adjust the 3 knobs to maximum (Load, D-Time and O-Time),
- Adjust the D-Time knob to the value corresponding to the motor starting time.
- When the motor reaches steady state, adjust the Load knob (turn the knob counter-clockwise until the red LED starts to flicker).
- Slowly turn the Load knob clockwise until the LED goes out.
- Set the required tripping time, using the O-Time knob.

### Description

#### Description

LR97 D ●●●●●

LT47 ●●●●●

- 1 RESET knob
- 2 TEST/STOP knob
- 3 Ready/Run Indicator
- 4 Relay tripped indicator
- 5 Current setting
- 6 Adjustment of starting time

### Presentation

Above 32 A, the TeSys U controller provides a motor starter management solution identical to that provided by TeSys U starter-controllers.

Used in conjunction with a short-circuit protection device and a contactor, it provides a motor starter whose functions are the same as those of a TeSys U starter-controller and, in particular, provides the following functions: overload protection, motor starter control and application monitoring.

It consists of a control unit whose adjustment range is compatible with the secondary of current transformers, plus a control base which also allows fitment of a function module or a communication module.

It requires a  $\sim$  24 V external power supply.

The secondaries of current transformers, the  $\sim$  24 V power supply, the 10 inputs and the 5 outputs are connected by screw terminal block.

### Application example

Detecting blockage of a rock crusher by monitoring the motor current.

#### Operating conditions

- Power: 90 kW at 400 V.
- In: 185 A.
- Duty class S1.
- Control circuit voltage:  $\sim$  230 V
- Control-command by PLC and serial link using the Modbus protocol.

#### Products used

Contactor	5	1	LC1 F185P7	–
Circuit-breaker	6	1	NS 250HMA	–

#### Functions performed

- Short-circuit protection with level of protection of 70 kA at 400V.
- Electronic protection against thermal overloads with an adjustment range of 4.
- Detection of crusher blockage by monitoring the induced overcurrent. To use the "over torque or jam" function, the following parameters must be entered:
  - trip: the answer yes/no enables or disables the function,
  - time before tripping: the time period during which the value of the current must be above the tripping threshold in order to cause tripping (adjustable from 1 to 30 s).
  - tripping threshold: value as a % of the load current ratio in relation to the setting current. If the ratio remains above this threshold for the time specified in the previous parameter, the product trips (adjustable from 100 to 800 %).

It is possible to set the parameter for an alarm at a preset threshold under the same conditions as above.

Application example (continued)

Scheme

Other functions

The multifunction control unit incorporates other control and protection functions, such as: monitoring and control of phase current, alarm, ... Communication module LUL C033 also provides a programmable output and two programmable inputs.

Environment				
Control base and control unit type		LUT M + LUCB T1BL or LUCD T1BL without LUL C		LUT M + LUCM T1BL or LUL C
Product certifications		UL, CSA, ASEFA		
Conforming to standards		IEC/EN 60947-4-1, UL 508, CSA C22-2 N°14		
Rated insulation voltage of the outputs (Ui)	Conforming to IEC/EN 60947-1, overvoltage category III, degree of pollution: 3	V	250	
	Conforming to UL508, CSA C22-2 n°14	V	250

### Function modules and communication modules

The TeSys U controller is compatible with the modules listed below:

- Thermal overload alarm module LUF W10,
- Motor load indication module LUF V2,
- Communication modules:
  - Modbus (LUL C033),
  - CANopen (LULC08),
  - DeviceNet (LULC09),
  - Advantys STB (LUL C15).

**Note :** Communication modules **LUL C07** (Profibus DP), **ASILUF C5** and **ASILUF C51** (AS-Interface) are not compatible with the TeSys U controller.  
Module **LUF W10** is only compatible with control units **LUCB T1BL** and **LUCD T1BL**.

**Combinations providing type 2 coordination**

### Presentation

TeSys T is a motor management system that provides protection, metering and monitoring functions for single-phase and 3-phase, constant speed, a.c. motors up to 810 A.

Suitable for the harshest applications, this product range offers:

- high-performance multifunction protection, independent of the automation system,
- a local HMI control unit for reading, displaying and modifying the parameters monitored, diagnostics, etc.....
- configuration of the application using PowerSuite software,
- connection to the automation system via a communication network (selection according to various protocols).

### Application

The TeSys T motor management system is used for motor control and protection in harsh industrial applications, in which downtime must be avoided because it is very costly: Oil & Gas, chemical industry, water treatment, metal, minerals and mining, pharmaceutical industry, microelectronics, tunnels, airports etc.

With TeSys T, untimely stoppages of a process or manufacturing, associated with a motor, are anticipated via predictive analysis of fault situations. Fault tripping is therefore reduced to a minimum.

Its use in motor control panels makes it possible to:

- increase the operational availability of installations,
- improve flexibility from project design through to implementation,
- increase productivity by making available all information needed to run the system.

The TeSys motor management system integrates perfectly with Schneider Electric low voltage equipment, such as Okken, Blokset and Prisma.

- 1 Magnetic circuit-breaker
- 2 Contactor
- 3 Controller with extension module
- 4 Operator control unit

LTM CU

### Presentation (continued)

#### Composition of the motor management system

The system comprises:

- an LTM R motor management controller
  - with integral current transformer up to 100 A,
  - above 100 A, by external current transformer up to 810 A,
- an LTM E extension module,
- an LTM CU operator control unit,
- configuration software incorporated in the PowerSuite software application,
- accessories for system set-up.

#### Communication

The LTM R controller is equipped with a communication interface to allow remote monitoring and control of the motor. All motor information is then available at automation system level.

The following networks are available:

- Modbus, CANopen, DeviceNet, ProfiBus DP and Ethernet TCP/IP

#### TeSys T system functions

##### Protection functions:

- against thermal overload,
- against phase imbalance and phase failure,
- thermal motor protection via PTC probes,
- against phase reversal,
- against earth faults,
- against long starting times and motor stalling,
- against automatic load shedding and restarting,
- against load fluctuations (I, U, P),
- against variations of Cos  $\varphi$  (power factor).

##### Metering functions

- Measurements (rms values):
  - current on the 3 phases,
  - voltage on the 3 phases (shedding),
  - motor temperature,
  - earth fault,
- Values calculated:
  - average current,
  - frequency,
  - Cos  $\varphi$  (power factor), power, power consumption...

##### Motor control functions

A motor managed by TeSys T can be controlled:

- locally, using the logic inputs present on the product, or via the HMI terminal
- remotely, via the network (connection by terminal block or connector except for DeviceNet: terminal block only).

##### Motor control modes

5 predefined motor control modes are incorporated in the controller:

- overload mode: monitoring of motors whose control is not managed by the controller,
- independent mode: starting of non-reversing motors,
- reverser mode: starting of reversing motors,
- 2-step mode: 2-step starting of motors (star-delta, by autotransformer and by resistor),
- 2-speed mode: 2-speed starting of motors (Dahlander, pole changer).

A 6<sup>th</sup> "Custom" mode is available to allow the user to create a specific motor control mode that is not predefined in the controller.

##### Statistical and diagnostic functions

- fault statistics: counters per type of protection and history of the last 5 faults,
- motor statistics: saving of motor statistics values,
- diagnosis of faults affecting correct operation of the product.

LTM R●●

### Description

#### The LTM R controller

The controller is the central component in the motor management system. It manages the basic functions such as:

- measurement of 3-phase current via integral current transformers from 0.4 to 100 A (up to 810 A by external current transformers),
- measurement of earth current by external earth fault toroid.
- measurement of motor temperature by PTC probe,
- inputs and outputs for the various motor control modes, fault management and associated functions.

### Characteristics

As standard, the controller manages the following predefined control mode functions:

- overload mode,
- independent mode,
- reverser mode,
- 2-speed mode,
- 2-step mode,
- "Custom" mode.

#### Supply

2 types of controller power supply are available:

- $\overline{\text{---}}$  24 V,
- $\sim$  100...240 V.

#### Current ranges

3 current ranges allow measurement of motor current from 0.4 to 100 A:

- 0.4...8 A,
- 1.35...27 A,
- 5...100 A.

For use with external current transformers, choose the 0.4...8 A range (1 or 5 A current transformer secondary).

#### Inputs

- 6 discrete logic inputs.

#### Outputs

- 3 relay logic outputs (1N/O)
- 1 relay output for fault signalling (1N/O + 1N/C))

#### Measurements

- connections for a temperature probe,
- connections for an earth fault toroid.

### LTM E extension module

The extension module adds the following functionalities to the TeSys T controller:

- voltage measurement on the 3 phases. This enables it to calculate numerous engine monitoring parameters (power, frequency,  $\text{Cos } \varphi$  ...),
- 4 additional inputs.

### Characteristics

#### Inputs

- 4 discrete logic inputs (independent).

#### Power supplies

- 2 types of power supply for the inputs:  $\overline{\text{---}}$  24 V and  $\sim$  100...240 V.

A  $\overline{\text{---}}$  24 V controller can be assembled with an  $\sim$  100...240 V extension module and vice versa.

**Voltage measurement between phases up to 690 V nominal.**

LTM CU

**Description (continued)****Human/Machine Interfaces (HMI)**

Depending on the application, 2 types of HMI can be used with the LTM R controller.

- The LTM CU operator control unit:

- Entirely dedicated to the TeSys T range,
- Only for control/monitoring of an LTM R controller.

- A Magelis XBT N410 terminal

- For control/monitoring of 1 to 8 LTM R controllers.

**LTM CU operator control unit**

Dedicated exclusively to TeSys T controllers, control unit LTM CU makes it possible to:

- Configure the parameters of the LTM R controller
- Display information on controller configuration and operation.
- Monitor the alarms and faults generated by the controller.
- Local control of the motor via the local control interface (keys can be customised). Three different languages can be loaded into the LTM CU controller at the same time.

By default, these 3 languages are: English, French and Spanish.

**Note:** *English is the only compulsory language.*

A language download utility (LangTool), together with all the other languages, are available on the website "www.schneider-electric.com".

This tool allows the languages present in the LTM CU control unit to be adapted.

The LTM CU HMI control unit has an RJ45 port, protected by a flexible cover to provide a good level of protection (IP54).

This port on the front panel allows connection to a PC, via a connecting cable, in order to use PowerSuite software.

In this case, the control unit acts as a transmitter and all information can then be viewed in PowerSuite.

**The Magelis XBT N410 HMI terminal**

Two applications have been predefined for TeSys T. Depending on the application loaded, the HMI terminal makes it possible to:

- configure and monitor a motor starter (LTM\_1T1\_V1.dop).
- monitor and modify certain parameters on up to 8 motor starters (LTM\_1T8\_X\_V1.dop) (1).

XBT L1000 programming software is needed for loading applications into the HMI terminal.

These applications are available on the website "www.schneider-electric.com".

(1) Replace the X with an E for the English version, or an F for the French version.

### LTM R controllers

#### Modbus

#### DeviceNet

#### Profibus DP

#### CANopen

#### Ethernet TCP/IP

Controllers feature the following on their front panel:

- 1 Controller power supply.
- 2 Input connections.
- 3 Fault outputs (N/O+N/C).
- 4 Port for connection to the HMI terminal, a PC or an extension module (RJ45).
- 5 Controller status LEDs.
- 6 Network port for connection to the network by connector (except DeviceNet) (1).
- 7 Test/Reset button.
- 8 Connection to the network by terminal block (except Ethernet TCP/IP).
- 9 Connection for an earth fault toroid and temperature probes.
- 10 Outputs for motor control mode function.

6

(1) Connection using power extension (daisy-chaining) is possible for Ethernet TCP/IP.

### LTM EV40 extension modules

### LTM CU operator control unit

Extension modules have the following on their front face:

- 1 Inputs for voltage measurement.
- 2 Port for connection to the HMI terminal or to the PC.
- 3 Port for connection to the controller.
- 4 Extension module status LEDs.
- 5 Connection of additional inputs.

The control unit has the following on its front face:

- 1 Screen. LCD display
- 2 Local control interface including control keys and LEDs.
- 3 RJ45 port on front panel for connection to a PC (protected by a cover).
- 4 Contextual navigation keys.

Thermal and current protection functions					
Functions	Setting range	Controller LTM R	Controller and extension module (LTM R + LTM E)	Alarm threshold	Fault threshold
Description					
<b>Thermal overload:</b> thermal protection of motor by monitoring current consumption	Class: 5, 10, 15, 20, 25, 30. Inverse ther/definite time				
<b>Motor temperature:</b> thermal monitoring of the motor using temperature probes (winding, paper...). Up to 3 sensors in series.	PTC binary PTC/NTC analogue: 20 ...6500 Ohm				
<b>Phase imbalance:</b> monitors the symmetry of currents. To be used for imbalance < 80% of the average current (1).	10...70% I average 0.2...20 s				
<b>Phase failure:</b> monitors the symmetry of currents. To be used for imbalance < 80% of the average current (1).	0.1...30 s				
<b>Phase reversal:</b> signals when the phase sequence is different from the defined sequence (motor running).	A-B-C A-C-B				
<b>Long starting time:</b> monitors the motor starting time	100...800 % of FLC (2) 1...200 s				
<b>Locked rotor:</b> locking detected by a sudden increase in current after the start phase	100...800 % of FLC (2) 1...30 s				
<b>Min/max current load limit variations:</b> monitors motor load through variations of current around preset thresholds.	<b>min.:</b> 30...100 % of FLC (2) 1...200 s <b>max.:</b> 20...800 % of FLC (2) 1...250 s				
<b>Earth fault:</b> signals internal insulation faults, by vectorial summing of external currents, via earth fault toroid.	<b>internal:</b> 20...500 % min FLC (2) 0.05...25 s <b>external:</b> 0.02...10 A 0.05...25 s				
<b>Frequent starting:</b> Protects the motor against overheating due to frequent starting.	0...999.9 s				
Voltage and power protection functions					
<b>Phase imbalance:</b> monitors the symmetry of voltage between phases. To be used for imbalance < 40 % of the average voltage (3).	3...15 % 0.2...20 s				
<b>Phase failure:</b> monitors the symmetry of voltage between phases. To be used for imbalance > 40 % of the average voltage (3).	0.1...30 s				
<b>Phase reversal:</b> signals when the phase sequence is different from the defined sequence (motor stopped).	A-B-C A-C-B				
<b>Voltage variations.</b> <b>Min/max voltage limits:</b> monitors voltage variations around preset thresholds.	<b>min.:</b> 70...99 % 0.2...25 s <b>max.:</b> 101...115 % 0.2...25 s				
<b>Load shedding:</b> opens outputs O.1 and O.2 if voltage drops below a preset threshold.	68...115 % 1...9999 s				
<b>Power variations.</b> <b>Min/max power limits:</b> monitors power variations around preset thresholds.	20...800 % 0...100 s				
<b>Variations of Cos φ.</b> <b>Min/max limits of Cos φ :</b> monitors variations of Cos φ around preset thresholds.	0...10...25 s				

Function performed.

(1) Average current value measured on the 3 phases.  
(2) FLC: Full Load Current (setting current).  
(3) Average voltage value measured on the 3 phases.

### Service classes offered by the Ethernet TCI/IP version

<b>Class</b>	A 20 ETH10/100 + FTP server	
<b>Basic Web server</b>	None	
<b>Basic communications services Ethernet TCP/IP</b>	Modbus messaging (read/write of data words)	
<b>Ethernet TCP/IP communication advanced management services</b>	I/O Scanning	Yes
	Global Data	No
	Client FDR (1)	Automatic monitoring and updating of product parameter configuration. Automatic assignment of IP address and network parameters.
	SNMP network administrator (2)	Yes

### Ethernet: different network topologies

#### Star topology

In a star topology, all the peripherals are linked via an intermediate peripheral (hub or switch)..

In industrial Ethernet applications, the use of full duplex switches (instead of hubs) as central peripherals is strongly recommended.

Star topology

#### Power extension (Daisy chain) topology

Power extension (or *Daisy chaining*), at bus level, is another connection topology commonly used in traditional, industrial automation system networks. The cable segments link several peripherals to each other, constituting the peripheral "section" of the network cable.

#### Ethernet Power extension (Daisy chain)

Power extension is not yet a very commonly used Ethernet connection topology, but will quickly become so when a large number of peripherals are made available in the market.

In an Ethernet power extension topology, the peripherals have:

- 2 Ethernet ports
- and an integrated switch.

Schneider Electric is progressively introducing, into the industrial market, Ethernet peripherals that can be used in daisy chain type architectures.

#### Implementation of a power extension topology

No hub or switch is required for using a power extension topology. Each peripheral must have an integrated switch (two ports).

A port on the peripheral is connected to a port on the neighbouring upstream and downstream peripherals. These consecutive connections constitute the power extension (daisy chain).

Ethernet switches may be included in a power extension (daisy chain) topology when several scan chains are used by the monitoring peripheral.

The Ethernet switch must be installed close to the monitoring peripheral, with the various scan chains coming from the switch.

(1) FDR : Faulty Device Replacement.

(2) SNMP: Simple Network Management Protocol.

Daisy chain topology

Ring topology

### Ethernet: different network topologies (continued)

#### Ring topology

In a ring topology, all the peripherals or components of the network infrastructure are connected within a loop.

This type of topology makes it possible to achieve different levels of redundancy of the network.

#### Ethernet ring

Ethernet rings are generally the main networks in applications where a high level of reliability is required. If a ring topology is required, the switches handling this function must be used.

#### Redundancy

Redundancy of the network infrastructure is the key to development of applications with high operational reliability.

Implementing a single or double ring architecture makes it possible to provide protection against breaks in network segments.

#### Single ring

The first level of redundancy can be achieved by installing a single ring.

ConneXium switches can be used to establish main network ring configurations.

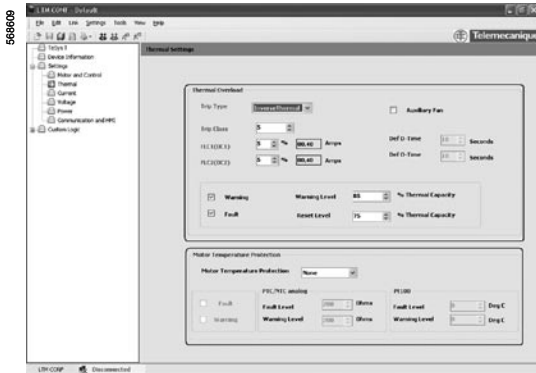

The ring is created using HIPER-Ring ports.

If a section of the line fails, the ring structure (including a maximum of 50 switches) converts into a line type configuration in less than 0.5 seconds.

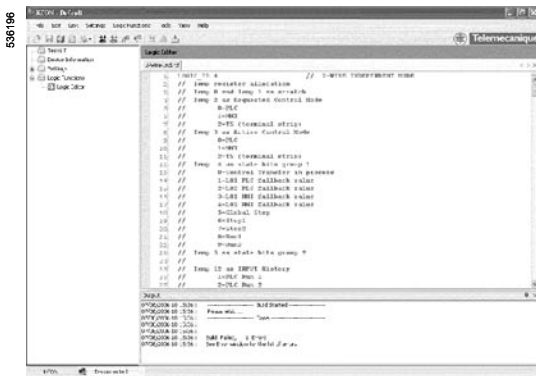

### Possible configurations and applications

Example of TeSys T configurator setup screen

Example of logic editor screen.

### Configuration with PowerSuite

The TeSys T configurator is incorporated in the PowerSuite software application, as from version 2.5. (1)

It allows configuration, commissioning and maintenance of motor starters protected by TeSys T.

A library containing predefined motor control mode functions is available in order to:

- allow standardisation,
- avoid errors,
- reduce motor starter setup times.

5 predefined motor control modes are incorporated in the controller:

- overload mode: monitoring of motors whose control is not managed by the controller,
- independent mode: starting of non-reversing motors,
- reverser mode: starting of reversing motors,
- 2-step mode: 2-step starting of motors (star-delta, by autotransformer and by resistor),
- 2-speed mode: 2-speed starting of motors (Dahlander, pole changer).

By using logic functions, a "Custom" mode makes it possible to:

- easily adapt these predefined motor control mode functions to the specific needs of your applications,
- create a link with the motor starter environment or
- create new functions.

The functions thus defined can be saved and used to build your function library for future applications.

To create special functions, a logic editor is incorporated in the configurator and allows a choice of 2 programming languages:

- function block,
- structured text.

(1) An update file is available, free of charge, on the website "www.schneider-electric.com". It will enable you to take advantage of the latest functions in the TeSys T motor management system.

## Configuration tools

Description	Composition	Reference	Weight kg
<b>Connection kit for PC serial port for Modbus</b> for Modbus multidrop connection	<ul style="list-style-type: none"> <li>■ 1 x 3 m length cable with two RJ45 connectors,</li> <li>■ 1 RS 232/RS 485 converter with one 9-way female SUB-D connector and one RJ45 connector.</li> </ul>	VW3 A8 106	–
<b>Interface for USB port</b> (for use with cable VW3 A8 106) Length: 1.8 m	<ul style="list-style-type: none"> <li>■ 1 USB cable, SUB-D 9-way</li> <li>■ Drivers supplied on CD-Rom</li> </ul>	SR2 CBL06	0.350

## Current transformers (1)

Operational current		Reference	Weight
Primary	Secondary		kg
A	A		
100	1 (2)	LT6 CT1001	0.550
200	1 (2)	LT6 CT2001	0.550
400	1 (2)	LT6 CT4001	0.550
800	1 (2)	LT6 CT8001	0.680

## Earth fault toroids (marketed under the Schneider Electric brand)

Rated operational current Ie	Internal Ø of toroid	Reference	Weight
A	mm		kg
<b>Closed toroids, type A</b>			
65	30	50437	0.120
85	50	50438	0.200
160	80	50439	0.420
250	120	50440	0.530
400	200	50441	1.320
630	300	50442	2.230

## Split toroids, type OA

85	46	50485	1.300
250	110	50486	3.200

## PTC thermistor probes (3)

Description	Nominal Operating Temperature (NOT)	Colour	Unit reference (4)	Weight
	°C			kg
Triple probes	90	Green/green	DA1 TT090	0.010
	110	Brown/brown	DA1 TT110	0.010
	120	Grey/grey	DA1 TT120	0.010
	130	Blue/blue	DA1 TT130	0.010
	140	White/blue	DA1 TT140	0.010
	150	Black/black	DA1 TT150	0.010
	160	Blue/red	DA1 TT160	0.010
	170	White/green	DA1 TT170	0.010

(1) The transformers offered for use with TeSys U controllers are suitable (see page 6/64).

(2) For use with LTM R08●● controllers.

(3) PTC: Positive Temperature Coefficient.

(4) Sold in lots of 10.

LT6 CT4001

50486	78	224	110	76

### Schemes

#### Overload mode

##### 3-wire local-control

(1) Connection of a single-phase motor is possible. In this case, do not use the central current transformer.

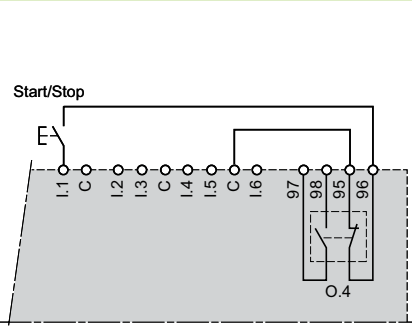

#### Independent mode

##### 3-wire local-control

6

##### 2-wire local-control

##### 3-wire with switchable local/network control

##### 2-wire with switchable local/network control

L : Local control  
O : Stop  
N : Network control

**Schemes (continued)**

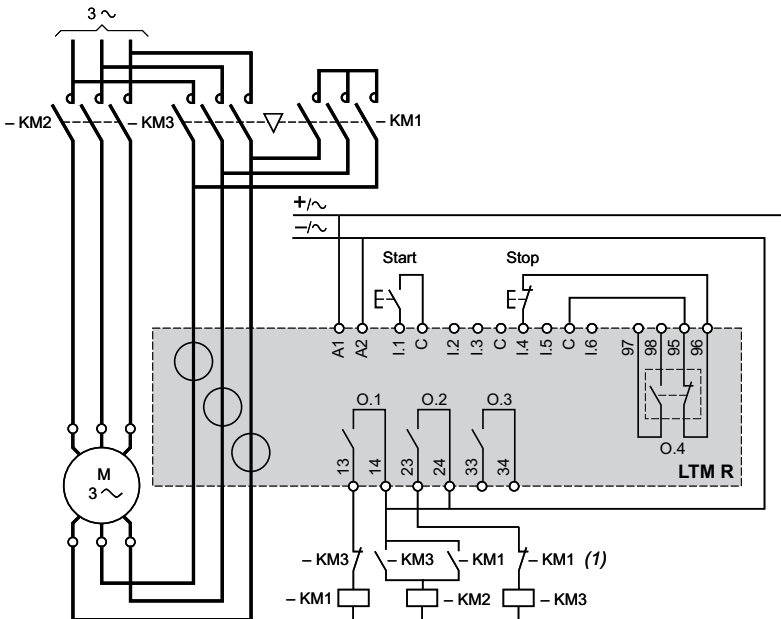

**Reverser mode**

**3-wire local-control**

**2-step mode, star-delta application**

**3-wire local-control**

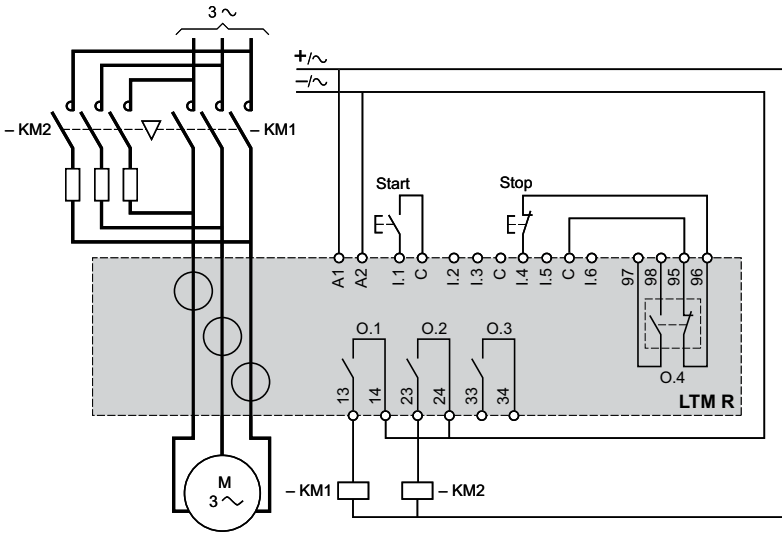

(1) Contacts for interlocking KM1 and KM2 are not obligatory because the controller electronically interlocks outputs O.1 and O.2.

**Schemes (continued)**

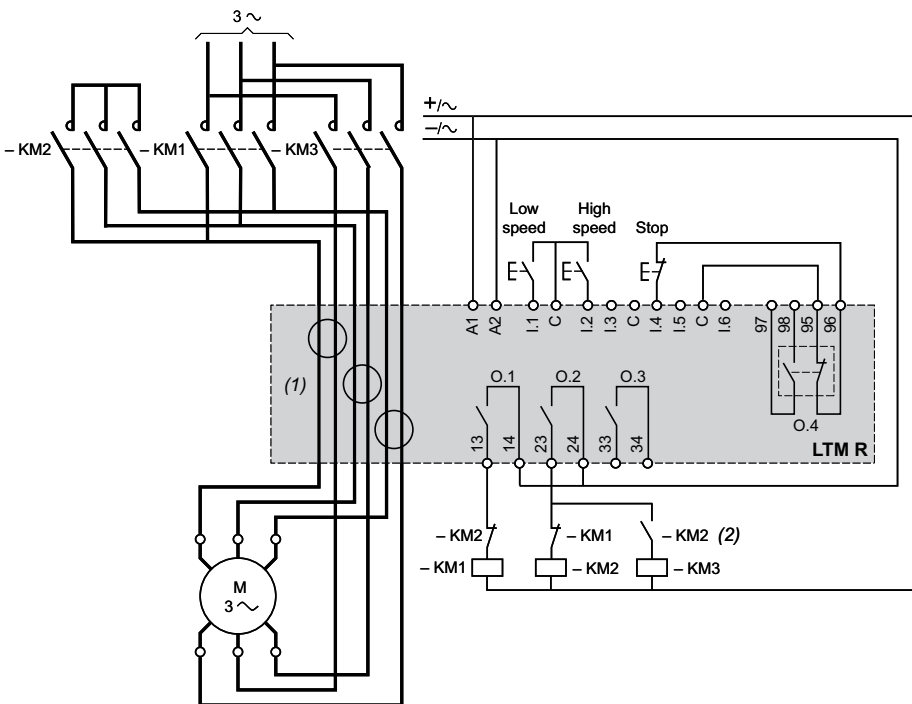

**2-step mode, primary resistor application**

**3-wire local-control**

**2-speed mode, Dahlander application**

**3-wire local-control**

6

(1) For a Dahlander application, all the power cables must pass through current transformers. The controller can also be placed upstream of the contactor. In this case, and if the Dahlander motor is used in "variable torque" mode, all the cables downstream of the contactors must be of identical size.  
 (2) Contacts for interlocking KM1 and KM2 are not obligatory because the controller electronically interlocks outputs O.1 and O.2.

**Schemes (continued)**

**Earth fault toroid and motor temperature probe connection**

**Connection of outputs for motor control mode function**

**Without intermediate relay**

**With intermediate relay**
