

# SGM2036 300mA, Low Power and Low Dropout RF Linear Regulator

## GENERAL DESCRIPTION

The SGM2036 is a low noise, low voltage and low dropout voltage linear regulator. It is capable of supplying 300mA output current with typical dropout voltage of only 165mV. The operating input voltage range is from 1.6V to 5.5V. The output voltage range is from 0.8V to 5.0V in fixed output version. For adjustable output version, the output voltage can be adjusted from 0.8V to 5.0V by using external resistors.

Other features include logic-controlled shutdown mode, short-circuit current limit and thermal shutdown protection. The SGM2036 has automatic discharge function to quickly discharge  $V_{OUT}$  in the disabled status.

The SGM2036 is available in Green UTDFN-1×1-4L, SOT-23-5 and SC70-5 packages. It operates over an operating temperature range of -40°C to +85°C.

## FEATURES

- **Operating Input Voltage Range: 1.6V to 5.5V**
- **Fixed Output Voltages: 0.8V, 0.9V, 1.0V, 1.05V, 1.1V, 1.2V, 1.3V, 1.35V, 1.5V, 1.8V, 1.85V, 2.1V, 2.2V, 2.3V, 2.5V, 2.6V, 2.7V, 2.8V, 2.85V, 2.9V, 3.0V, 3.1V, 3.3V, 3.6V, 4.2V, 4.4V and 5.0V**
- **Adjustable Output from 0.8V to 5.0V**
- **300mA Guaranteed Output Current**
- **Output Voltage Accuracy:  $\pm 2.5\%$  at +25°C**
- **Low Dropout Voltage: 165mV (TYP) at 300mA**
- **Low Supply Current: 20 $\mu$ A (TYP)**
- **Shutdown Supply Current: 0.01 $\mu$ A (TYP)**
- **Short Start-Up Time**
- **Short Auto-Discharge Function**
- **Thermal Shutdown Protection**
- **Short-Circuit Current Limit**
- **-40°C to +85°C Operating Temperature Range**
- **Available in Green UTDFN-1×1-4L, SOT-23-5 and SC70-5 Packages**

## APPLICATIONS

Modems  
Cellular Telephones  
PCMCIA Cards  
Palmtop Computers  
Portable Electronics

**OVERSTRESS CAUTION**

Stresses beyond those listed in Absolute Maximum Ratings may cause permanent damage to the device. Exposure to absolute maximum rating conditions for extended periods may affect reliability. Functional operation of the device at any conditions beyond those indicated in the Recommended Operating Conditions section is not implied.

**ESD SENSITIVITY CAUTION**

This integrated circuit can be damaged if ESD protections are not considered carefully. SGMICRO recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage. ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because even small parametric changes could cause the device not to meet the published specifications.

**DISCLAIMER**

SG Micro Corp reserves the right to make any change in circuit design, or specifications without prior notice.

**PIN CONFIGURATIONS**

**PIN DESCRIPTION**

PIN		NAME	FUNCTION
UTMDFN-1x1-4L	SOT-23-5/ SC70-5		
1	5	OUT	Regulator Output Pin. It is recommended to use a ceramic capacitor with effective capacitance in the range of 0.5μF to 10μF to get good power supply decoupling. This ceramic capacitor should be placed as close as possible to OUT pin.
2	2	GND	Ground.
3	3	EN	Enable Pin. Drive EN high to turn on the regulator. Drive EN low to turn off the regulator. This pin must be pulled high by an external resistor connected to IN pin if EN pin is not used.
4	1	IN	Input Voltage Supply Pin. It is recommended to use a 1μF or larger ceramic capacitor from IN pin to ground. This ceramic capacitor should be placed as close as possible to IN pin.
-	4	BP	Reference-Noise Bypass Pin (fixed voltage version only). Bypass with an external capacitor C <sub>BP</sub> can reduce output noise to very low level. The capacitor is recommended to be placed very close to the pin for high PSRR.
		FB	Feedback Voltage Input Pin (adjustable voltage version only). Connect this pin to the external resistor divider to adjust the output voltage. Place the resistors as close as possible to this pin.
Exposed Pad	-	-	Exposed Pad. Connect it to GND internally. Connect it to a large ground plane to maximize thermal performance; this pad is not an electrical connection point.

## NOTES:

1. The dropout voltage is defined as the difference between V<sub>IN</sub> and V<sub>OUT</sub> when V<sub>OUT</sub> falls to V<sub>OUT</sub> - 100mV.
2. Output voltage temperature coefficient is defined as the worst-case voltage change divided by the total temperature range.
3. Time needed for V<sub>OUT</sub> to reach 90% of final value.

## APPLICATION INFORMATION

The SGM2036 is a low input voltage, ultra-low noise and low dropout LDO and provides 300mA output current. These features make the device a reliable solution to solve many challenging problems in the generation of clean and accurate power supply. The high performance also makes the SGM2036 useful in a variety of applications. The SGM2036 provides the protection function for output overload, output short-circuit condition and overheating.

The SGM2036 provides an EN pin as an external chip enable control to enable/disable the device. When the regulator is in shutdown state, the shutdown current consumes as low as 0.01 $\mu$ A (TYP).

### Input Capacitor Selection ( $C_{IN}$ )

The input decoupling capacitor is necessary to be connected as close as possible to the IN pin for ensuring the device stability. 1 $\mu$ F or greater X7R or X5R ceramic capacitor is selected to get good dynamic performance.

When  $V_{IN}$  is required to provide large current instantaneously, a large effective input capacitor is required. Multiple input capacitors can limit the input tracking inductance. Adding more input capacitors is available to restrict the ringing and to keep it below the device absolute maximum ratings.

### Output Capacitor Selection ( $C_{OUT}$ )

The output decoupling capacitor should be located as close as possible to the OUT pin. 1 $\mu$ F or greater X7R or X5R ceramic capacitor is selected to get good dynamic performance. The minimum effective capacitance of  $C_{OUT}$  that SGM2036 can remain stable is 0.5 $\mu$ F. For ceramic capacitor, temperature, DC bias and package size will change the effective capacitance, so enough margin of  $C_{OUT}$  must be considered in design. Larger capacitance and lower ESR  $C_{OUT}$  will help improve the load transient response and increase the high frequency PSRR.

### Enable Control

The SGM2036 uses the EN pin to enable/disable its device and to deactivate/activate the output automatic discharge function.

When the EN pin voltage is lower than 0.4V, the device is in shutdown state, there is no current flowing from IN to OUT pins. In this state, the automatic discharge transistor is active to discharge the output voltage through a 50 $\Omega$  (TYP) resistor.

When the EN pin voltage is higher than 1.5V, the device is in active state, the input voltage is regulated to the output voltage and the automatic discharge transistor is turned off.

The EN pin is pulled down by internal 0.8 $\mu$ A (TYP) current source when the EN pin is floated. This current source will ensure the SGM2036 in shutdown state and reduce the power dissipation in system.

### Reverse Current

The pass transistor has an inherent body diode which will be forward biased in the case when  $V_{OUT} > (V_{IN} + 0.3V)$ . If extended reverse voltage operation is anticipated, external limiting might be appropriate.

### Negatively Biased Output

When the output is negative voltage, the chip may not start up due to parasitic effects. Ensure that the output is greater than -0.3V under all conditions. If excessive negatively biased output is expected in the application, a Schottky diode can be added between the OUT pin and GND pin.

### Output Current Limit and Short-Circuit Protection

When overload events happen, the output current is internally limited to 560mA (TYP). When the OUT pin is shorted to ground, the short-circuit protection will limit the output current to 200mA (TYP).

### Thermal Shutdown

The SGM2036 can detect the temperature of die. When the die temperature exceeds the threshold value of thermal shutdown, the SGM2036 will be in shutdown state and it will remain in this state until the die temperature decreases to +140°C.
