

GENERAL DESCRIPTION

The SGM2203 series is a set of low power high precision high voltage regulator implemented in CMOS technology which can provide 150mA output current. The device allows input voltage as high as 36V. The SGM2203 is available in 3.0V, 3.3V, 4.2V, 4.4V and 5.0V output voltages. CMOS technology ensures low dropout voltage and low quiescent current. The output voltage tolerance is kept within ±1%.

Although designed primarily as fixed voltage regulator, the device can be used with external components to obtain variable output voltages.

The SGM2203 is available in Green SOT-23, SOT-23-5 and SOT-89-3 packages. It operates over an ambient temperature range of -40°C to +85°C.

FEATURES

- Low Power Consumption
- 150mA Nominal Output Current
- Low Dropout Voltage
- Low Temperature Coefficient
- High Input Voltage (up to 36V)
- Output Voltage Accuracy: ±1%
- Fixed Outputs of 3.0V, 3.3V, 4.2V, 4.4V and 5.0V
- -40°C to +85°C Operating Temperature Range
- Available in Green SOT-23, SOT-23-5 and SOT-89-3 Packages

OVERSTRESS CAUTION

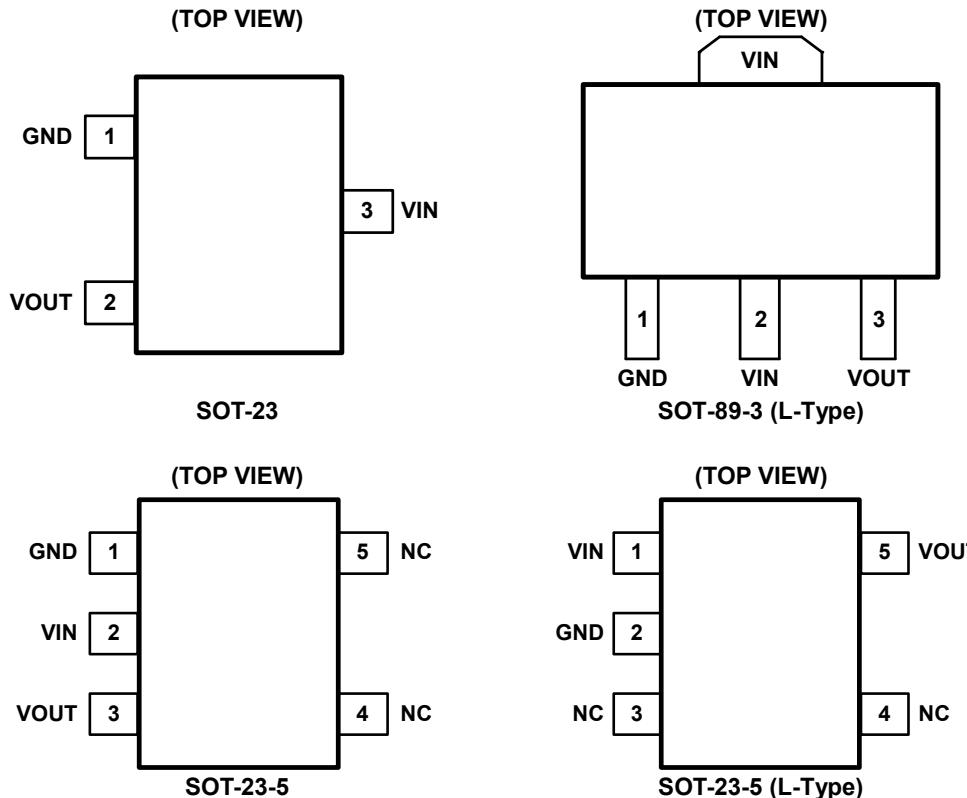

Stresses beyond those listed may cause permanent damage to the device. Functional operation of the device at these or any other conditions beyond those indicated in the operational section of the specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

ESD SENSITIVITY CAUTION

This integrated circuit can be damaged by ESD if you don't pay attention to ESD protection. SGMICRO recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage. ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

DISCLAIMER

SG Micro Corp reserves the right to make any change in circuit design, specification or other related things if necessary without notice at any time.

NOTES:

1. Maximum output current is affected by the PCB layout, size of metal trace, the thermal conduction path between metal layers, ambient temperature and the other environment factors of system. Attention should be paid to the dropout voltage when $V_{IN} < V_{OUT} + V_{DROP}$.
2. The dropout voltage is defined as $V_{IN} - V_{OUT}$, when V_{OUT} is 95% of the value of V_{OUT} for $V_{IN} = V_{OUT} + 2V$.
3. Output voltage temperature coefficient is defined as the worst-case voltage change divided by the total temperature range.

APPLICATION INFORMATION

Input Capacitor and Output Capacitor

For proper operation, place a ceramic capacitor (C_{IN}) between 1 μ F and 10 μ F between the input pin and ground. Larger values in this range will help improve line transient response.

For stable operation, use a ceramic capacitor (C_{OUT}) between 1 μ F and 10 μ F. Larger values in this range will help improve load transient response and reduce noise. Output capacitors of other dielectric types may be used, but are not recommended as their capacitance can deviate greatly from their rated value over temperature.

Thermal Considerations

When the junction temperature is too high, the thermal protection circuitry sends a signal to the control logic that will shutdown the IC. The IC will restart when the temperature has sufficiently cooled down.

The maximum power dissipation is dependent on the thermal resistance of the case and the circuit board, the temperature difference between the die junction and the ambient air, and the rate of air flow. The GND pin must be connected to the ground plane for proper dissipation.
