

GENERAL DESCRIPTION

The SGM2209 is a low power, low noise, fast transient response and low dropout voltage linear regulator. It provides -500mA output current capability. The operating input voltage range is from -2.7V to -24V. The adjustable output voltage range is from -1.2V to $(-V_{IN} + V_{DROP})$.

Other features include logic-controlled shutdown mode, short-circuit current limit and thermal shutdown protection. The SGM2209 has automatic discharge function to quickly discharge V_{OUT} in the disabled status.

The SGM2209 is available in Green TDFN-2x2-6AL, TDFN-3x3-8L and SOT-23-5 packages. It operates over an operating temperature range of -40°C to +125°C.

APPLICATIONS

Industrial and Medical Equipment
 Communications and Infrastructure
 Precision Amplifiers
 ADC and DAC Circuits

FEATURES

- **Input Voltage Range: -2.7V to -24V**
- **Output Voltage Accuracy: $\pm 1\%$ at +25°C**
- **Fixed Outputs of 1.2V, 1.5V, 1.8V, 2.5V, 2.8V, 3.0V, 3.3V and 5.0V**
- **Adjustable Output from -1.2V to $(-V_{IN} + V_{DROP})$**
- **-500mA Output Current**
- **Low Quiescent Current:**
 $I_{GND} = -1.2mA$ (TYP) with -500mA Load
- **Low Dropout Voltage:**
 $-345mV$ (TYP) at -500mA, at $V_{OUT} = -3.0V$
- **Low Noise:**
 - ◆ $10.5\mu V_{RMS}$ (TYP) at $V_{OUT} = -1.2V$
 - ◆ $12\mu V_{RMS}$ (TYP) at $V_{OUT} = -2.5V$
 - ◆ $16\mu V_{RMS}$ (TYP) at $V_{OUT} = -5.0V$
- **PSRR: -60dB at 10kHz at $V_{OUT} = -2.5V$**
- **Positive or Negative Enable Logic**
- **Stable with Small 2.2 μF Ceramic Output Capacitor**
- **Low Shutdown Current: -1.1 μA (TYP)**
- **Current Limiting and Thermal Protection**
- **-40°C to +125°C Operating Temperature Range**
- **Available in Green TDFN-2x2-6AL, TDFN-3x3-8L and SOT-23-5 Packages**

Output Capacitance, COUT.....	1.5µF to 10µF

OVERSTRESS CAUTION

Stresses beyond those listed in Absolute Maximum Ratings may cause permanent damage to the device. Exposure to absolute maximum rating conditions for extended periods may affect reliability. Functional operation of the device at any conditions beyond those indicated in the Recommended Operating Conditions section is not implied.

ESD SENSITIVITY CAUTION

This integrated circuit can be damaged if ESD protections are not considered carefully. SGMICRO recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage. ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because even small parametric changes could cause the device not to meet the published specifications.

DISCLAIMER

SG Micro Corp reserves the right to make any change in circuit design, or specifications without prior notice.

PIN CONFIGURATIONS

PIN CONFIGURATIONS (continued)

PIN DESCRIPTION

PIN			NAME	FUNCTION
TDFN-2x2-6AL	TDFN-3x3-8L	SOT-23-5		
1	1, 2	5	VOUT	Regulator Output Pin. It is recommended to use a ceramic capacitor with effective capacitance in the range of 1.5μF to 10μF to get good power supply decoupling. This ceramic capacitor should be placed as close as possible to VOUT pin.
2	3	4	NC	Not Connected (fixed voltage version).
			ADJ	Adjustable Input (adjustable voltage version only). Connect this pin to the midpoint of an external resistor divider to adjust the output voltage. Place the resistors as close as possible to this pin.
3	4	3	EN	Enable Pin. Drive EN 2.0V above or below ground to turn on the regulator. Drive EN to ground to turn off the regulator. Connect the EN pin to the VIN pin when using automatic startup.
4	5	–	NC	Not Connected.
5	6	1	GND	Ground.
6	7, 8	2	VIN	Input Voltage Supply Pin. It is recommended to use a 2.2μF or larger ceramic capacitor from VIN pin to ground. This ceramic capacitor should be placed as close as possible to VIN pin.
Exposed Pad	Exposed Pad	–	VIN	Exposed Pad. Connect the exposed pad at the bottom of the package to the internal VIN for maximum thermal performance. In normal use, connect the exposed pad to the VIN on the board, which is the most negative potential in the negative voltage regulating circuit.

Thermal Shutdown Temperature	T_{SHDN}				160		°C
Thermal Shutdown Hysteresis	ΔT_{SHDN}				20		°C

NOTES:

1. The dropout voltage is defined as the difference between V_{IN} and V_{OUT} when V_{OUT} falls to $95\% \times V_{OUT(NOM)}$.
2. Output current limit has the function of current foldback protection and refers to the current at which V_{OUT} falls to $90\% \times V_{OUT(NOM)}$.
3. The start-up time is defined as the time between the EN rising edge to V_{OUT} reaching $90\% \times V_{OUT(NOM)}$.

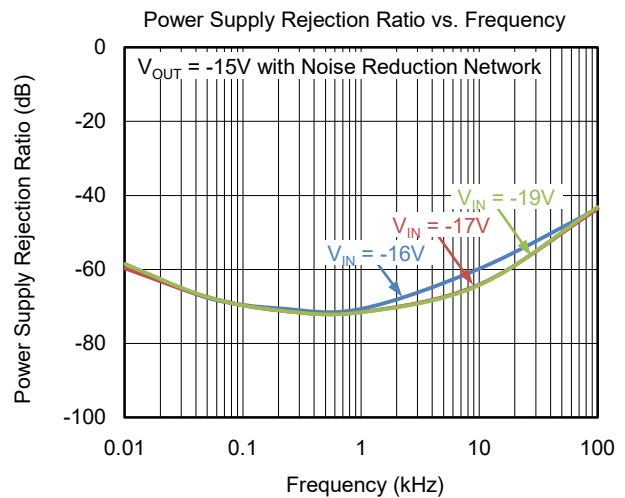

TYPICAL PERFORMANCE CHARACTERISTICS

FUNCTIONAL BLOCK DIAGRAMS

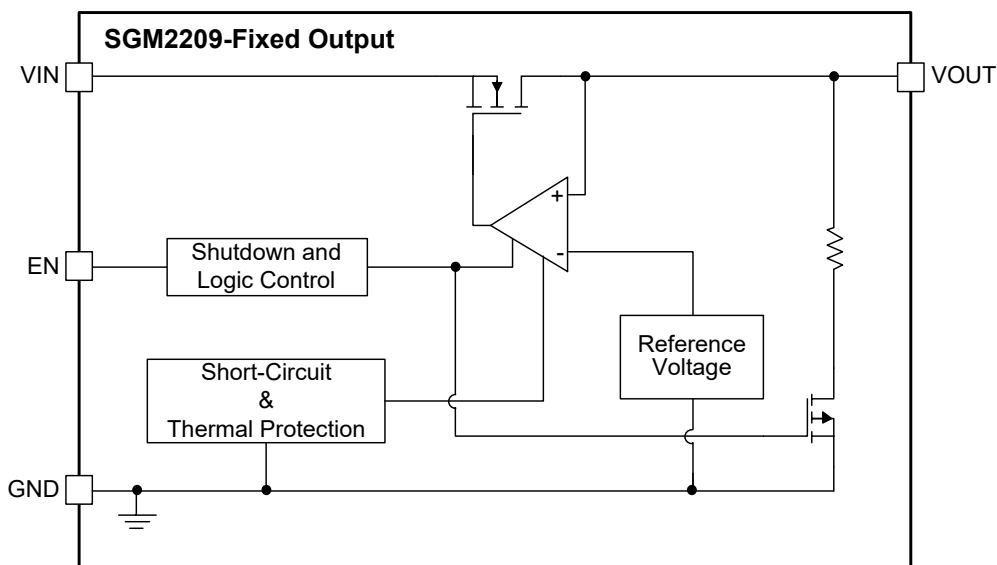

Figure 2. Fixed Output Voltage Internal Block Diagram

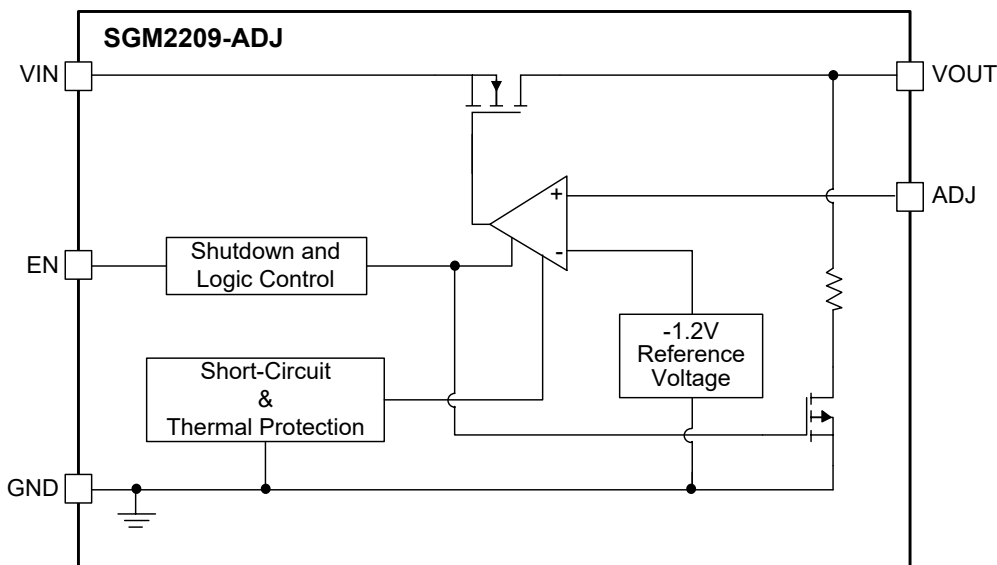

Figure 3. Adjustable Output Voltage Internal Block Diagram

APPLICATION INFORMATION

The SGM2209 is a low quiescent current, low noise and low dropout LDO and provides -500mA output current. These features make the device a reliable solution to solve many challenging problems in the generation of clean and accurate power supply. The high performance also makes the SGM2209 useful in a variety of applications. The SGM2209 provides the protection function for output overload, output short-circuit condition and overheating.

The SGM2209 provides an EN pin as an external chip enable control to enable/disable the device. When the regulator is in shutdown state, the shutdown current consumes as low as -1.1µA (TYP).

Input Capacitor Selection (C_{IN})

The input decoupling capacitor is necessary to be connected as close as possible to the VIN pin for ensuring the device stability. A 2.2µF or greater X7R or X5R ceramic capacitor is selected to get good dynamic performance.

When V_{IN} is required to provide large current instantaneously, a large effective input capacitor is required. Multiple input capacitors can reduce the impact from input trace inductance. Adding more input capacitors is available to restrict the ringing and to keep it below the device absolute maximum ratings.

Output Capacitor Selection (C_{OUT})

The output decoupling capacitor should be located as close as possible to the VOUT pin. A 2.2µF or greater X7R or X5R ceramic capacitor is selected to get good dynamic performance. The minimum effective capacitance of C_{OUT} that SGM2209 can remain stable is 1.5µF. For ceramic capacitor, temperature, DC bias and package size will change the effective capacitance, so enough margin of C_{OUT} must be considered in design. Larger capacitance and lower ESR C_{OUT} will help improve the load transient response and increase the high frequency PSRR.

Enable Pin Operation

The EN pin is used to enable and disable the VOUT pin under normal operating conditions. Connect the EN pin to the VIN pin when using automatic startup.

When EN is at ±2.0V with respect to GND, the device is in active state. When EN is at 0V, the device is in shutdown state. In this state, a discharge resistor

around 200kΩ connects to the VOUT pin and pulls the VOUT pin up to GND.

The EN pin of the SGM2209 is bipolar, even though the enable voltage can be positive or negative.

The typical hysteresis of the EN pin is shown in Figure 4. This feature is used to prevent on/off oscillations due to noise on the EN pin when it passes the threshold point.

Figure 4. Typical EN Pin Operation

Adjustable Regulator

For the SGM2209-ADJ, set the output voltage by using a resistor divider as shown in Figure 5. Choose R_{FB2} less than 120kΩ to maintain a 10µA minimum load. Calculate the value for the output voltage using the following equation:

$$V_{OUT} = -1.2V \times (1 + R_{FB1}/R_{FB2})$$

Figure 5. Adjustable Output Voltage Application

Soft-Start

When the device is enabled, the SGM2209 uses an internal soft-start to limit the inrush current. The start-up time for the -5.0V option is 540µs (TYP) from the time the EN active threshold is crossed to when V_{OUT} reaches 90% × V_{OUT(NOM)}.

APPLICATION INFORMATION (continued)

Noise Reduction of the Adjustable SGM2209

One parallel capacitor (C_{NR}) and resistor (R_{NR}) with R_{FB1} can be used to improve the feedback loop stability and PSRR, increase the transient response and reduce the output noise. Use $R_{FB2} = 13k\Omega$ to maintain a minimum load.

Figure 6. Noise Reduction Modification to Adjustable LDO

Output Current Limit and Short-Circuit Protection

When overload events happen, the output current is internally limited to -1.05A (TYP). When the VOUT pin is shorted to ground, the short-circuit protection will limit the output current to -360mA (TYP).

Thermal Shutdown

The SGM2209 can detect the temperature of die. When the die temperature exceeds the threshold value of thermal shutdown, the SGM2209 will be in shutdown state and it will remain in this state until the die temperature decreases to +140°C.

Layout Guidelines

To get good PSRR, low output noise and high transient response performance, the input and output bypass capacitors must be placed as close as possible to the VIN pin and VOUT pin separately.
