

# PR29MF21NSZ Series PR39MF2xNSZ Series

\*Non-zero cross type is also available.
(PR29MF1xNSZ Series/PR39MF1xNSZ Series)

# I<sub>T</sub>(rms)≤0.9A, Zero Cross type DIP 8pin Triac output SSR

#### ■ Description

PR29MF21NSZ Series and PR39MF2xNSZ Series Solid State Relays (SSR) are an integration of an infrared emitting diode (IRED), a Phototriac Detector and a main output Triac. These devices are ideally suited for controlling high voltage AC loads with solid state reliability while providing 4.0kV isolation (V<sub>iso</sub>(rms)) from input to output.

#### ■ Features

- 1. Output current, I<sub>T</sub>(rms)≤0.9A
- 2. Zero crossing functionary (V<sub>OX</sub>: MAX. 35V)
- 3. 8 pin DIP package (SMT gullwing also available)
- 4. High repetitive peak off-state voltage (V<sub>DRM</sub>: 600V, **PR39MF2xNSZ Series**)

(V<sub>DRM</sub>: 400V, PR29MF21NSZ Series)

- 5. I<sub>FT</sub> ranks available (see Model Line-up in this datasheet)
- 6. Superior noise immunity (dV/dt : MIN. 100V/μs)
- 7. Response time, ton: MAX. 50µs
- 8. High isolation voltage between input and output (Viso(rms): 4.0kV)

#### ■ Agency approvals/Compliance

- Recognized by UL508, file No. E94758 (as model No. R29MF2/R39MF2)
- Approved by CSA 22.2 No.14, file No. LR63705 (as model No. R29MF2/R39MF2)
- 3. Optionary available VDE approved (\*)(DIN EN 60747-5-2), file No. 40008898 (only for **PR39MF2xNSZ Series** as model No. **R39MF2**)
- 4. Package resin: UL flammability grade (94V-0)
  - (\*) DIN EN60747-5-2: successor standard of DIN VDE0884. Up to Date code "RD" (December 2003), approval of DIN VDE0884.

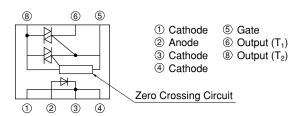

From Date code "S1" (January 2004), approval of DIN EN60747-5-2.

#### **■** Applications

- 1. Isolated interface between high voltage AC devices and lower voltage DC control circuitry.
- 2. Switching motors, fans, heaters, solenoids, and valves.
- 3. Power control in applications such as lighting and temperature control equipment.

	Frequency		f	_	50	60	Hz	
Operating temperature				$T_{opr}$	_	-20	80	°C

<sup>(\*)</sup> See Fig.2 about derating curve ( $I_T(rms)$  vs. ambient temperature).

#### Design guide

In order for the SSR to turn off, the triggering current (I<sub>F</sub>) must be 0.1mA or less.

Particular attention needs to be paid when utilizing SSRs that incorporate zero crossing circuitry.

If the phase difference between the voltage and the current at the output pins is large enough, zero crossing type SSRs cannot be used. The result, if zero crossing SSRs are used under this condition, is that the SSR may not turn on and off irregardless of the input current. In this case, only a non zero cross type SSR should be used in combination with the above mentioned snubber circuit selection process.

When the input current ( $I_F$ ) is below 0.1mA, the output Triac will be in the open circuit mode. However, if the voltage across the Triac,  $V_D$ , increases faster than rated dV/dt, the Triac may turn on. To avoid this situation, please incorporate a snubber circuit. Due to the many different types of load that can be driven, we can merely recommend some circuit values to start with :  $Cs=0.022\mu F$  and  $Rs=47\Omega$ . The operation of the SSR and snubber circuit should be tested and if unintentional switching occurs, please adjust the snubber circuit component values accordingly.

When making the transition from On to Off state, a snubber circuit should be used ensure that sudden drops in current are not accompanied by large instantaneous changes in voltage across the Triac.

This fast change in voltage is brought about by the phase difference between current and voltage.

Primarily, this is experienced in driving loads which are inductive such as motors and solenods.

Following the procedure outlined above should provide sufficient results.

For over voltage protection, a Varistor may be used.

Any snubber or Varistor used for the above mentioned scenarios should be located as close to the main output triac as possible.

All pins shall be used by soldering on the board. (Socket and others shall not be used.)

#### Degradation

In general, the emission of the IRED used in SSR will degrade over time.

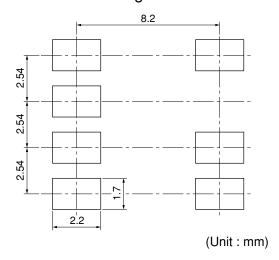

In the case where long term operation and / or constant extreme temperature fluctuations will be applied to the devices, please allow for a worst case scenario of 50% degradation over 5years.

Therefore in order to maintain proper operation, a design implementing these SSRs should provide at least twice the minimum required triggering current from initial operation.

#### Standard Circuit

<sup>☆</sup> For additional design assistance, please review our corresponding Optoelectronic Application Notes.

#### ■ Manufacturing Guidelines

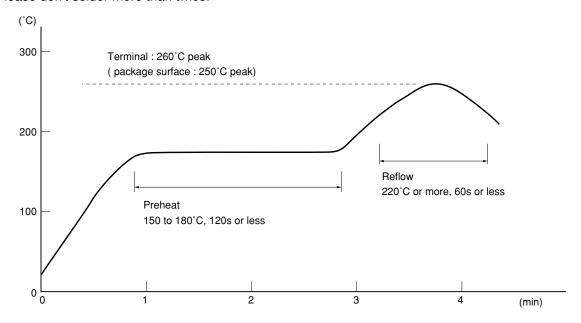

#### Soldering Method

#### Reflow Soldering:

Reflow soldering should follow the temperature profile shown below.

Soldering should not exceed the curve of temperature profile and time.

Please don't solder more than twice.

#### Flow Soldering:

Flow soldering should be completed below 270°C and within 10s.

Preheating is within the bounds of 100 to 150°C and 30 to 80s.

Please don't solder more than twice.

#### Hand soldering

Hand soldering should be completed within 3s when the point of solder iron is below 400°C.

Please don't solder more than twice.

#### Other notices

Please test the soldering method in actual condition and make sure the soldering works fine, since the impact on the junction between the device and PCB varies depending on the tooling and soldering conditions.

#### Cleaning instructions

#### Solvent cleaning:

Solvent temperature should be 45°C or below. Immersion time should be 3minutes or less.

#### Ultrasonic cleaning:

The impact on the device varies depending on the size of the cleaning bath, ultrasonic output, cleaning time, size of PCB and mounting method of the device.

Therefore, please make sure the device withstands the ultrasonic cleaning in actual conditions in advance of mass production.

#### Recommended solvent materials:

Ethyl alcohol, Methyl alcohol and Isopropyl alcohol.

In case the other type of solvent materials are intended to be used, please make sure they work fine in actual using conditions since some materials may erode the packaging resin.

#### Presence of ODC

This product shall not contain the following materials.

And they are not used in the production process for this device.

Regulation substances: CFCs, Halon, Carbon tetrachloride, 1.1.1-Trichloroethane (Methylchloroform)

Specific brominated flame retardants such as the PBBOs and PBBs are not used in this product at all.

# ■ Package specification

# ● Sleeve package Through-Hole

Package materials

Sleeve: HIPS (with anti-static material)

Stopper: Styrene-Elastomer

#### Package method

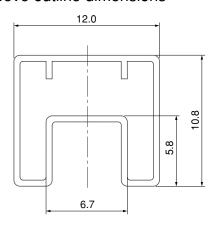

MAX. 50pcs of products shall be packaged in a sleeve.

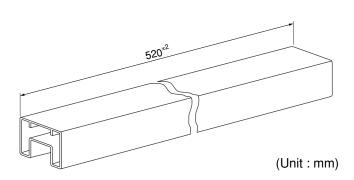

Both ends shall be closed by tabbed and tabless stoppers.

The product shall be arranged in the sleeve with its anode mark on the tabless stopper side.

MAX. 20 sleeves in one case.

#### Sleeve outline dimensions

# ● Tape and Reel package SMT Gullwing

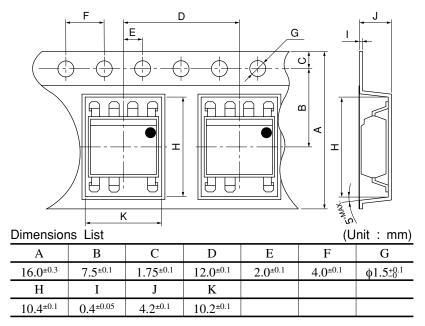

Package materials

Carrier tape: A-PET (with anti-static material)

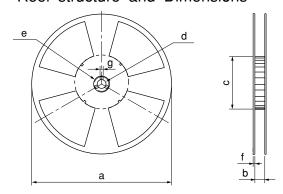

Cover tape: PET (three layer system)

Reel: PS
