

### ■ General Description

JY1105 series are CMOS positive voltage linear regulators with low current consumption, high accuracy output, output high speed, low dropout voltage and 500mA(Maximum) output. High accuracy output voltage  $\pm 1.5\%$  is realized by using laser trimming technology. The charged output capacitor can be discharged with an internal switch by making EN=VSS, as a result Vout quickly returns to the Vss level. JY1105 have both Thermal Shutdown, and Current limit to prevent device damage under the worst of operating conditions. Low ESR capacitors are available for input and output capacitor.

Adjustable output voltage version JY1105AF and Fixed output voltage version JY1105NF are available.

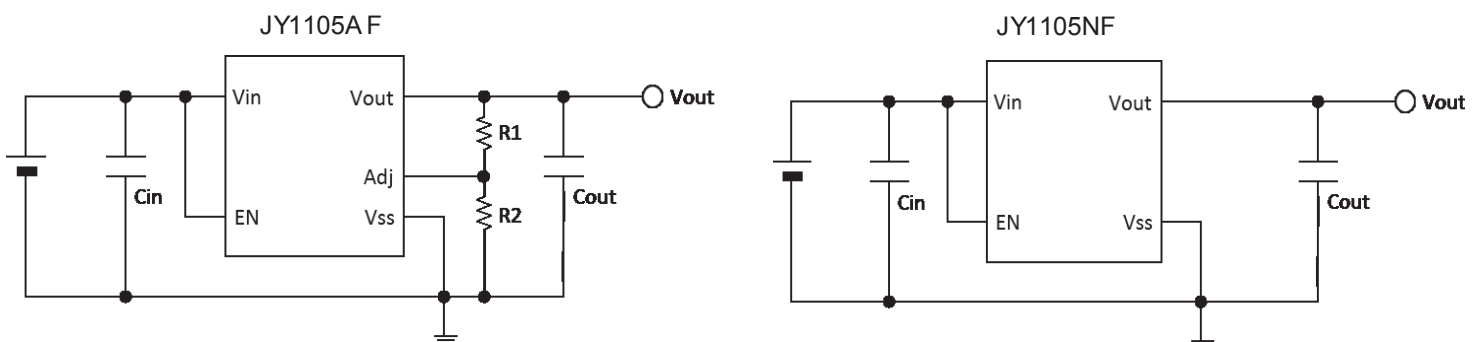

### ■ Features

- Fixed output voltage version.....0.8V~5.0V (selectable with a step of 0.05V)
- Adjustable output voltage version.....ADJ Reference Voltage=0.6V $\pm$ 1.2%, ( Available Vout=0.8V~5.0V )
- Operating input voltage.....1.7V~6.0V
- High accuracy output voltage..... $\pm 1.5\%$  (1.35V $\leq$ Vout),  $\pm 20$ mV (Vout<1.35V) at +25 $^{\circ}$ C
- Maximum output current .....500mA
- Low dropout voltage.....Typ. 220mV (output=3.0V, Iout=300mA)
- Low quiescent current.....Typ. 60 $\mu$ A
- High ripple rejection.....Typ. 75dB at 1KHz
- Low ESR output capacitor.....1.0  $\mu$ F (1.2V $\leq$ Vout), 3.3 $\mu$ F(Vout<1.2V)
- Low ESR input capacitor.....1.0  $\mu$ F
- Operating temperature range.....-40 $^{\circ}$ C to +85 $^{\circ}$ C
- Built-in over-current protector.....Limit current : 600mA(Typical )
- Built-in thermal shutdown circuit
- COUT high-speed auto-discharge
- Built-in On/Off circuit ( EN )

### ■ Applications

- Battery powered devices
- Cellular phone
- Digital / Video cameras
- Portable games
- Handheld instruments

### ■ Detailed Description

High speed, Low dropout, High output accuracy, Adjustable Output & Fixed Output

### Input and Output Capacitor Requirements

Minimum Capacitance	$V_{out} < 1.2V$	$1.2V \leq V_{out}$
$C_{in}$	$\geq 1\mu F$	$\geq 1\mu F$
$C_{out}$	$\geq 3.3\mu F$	$\geq 1\mu F$

X5R- and X7R-type ceramic capacitors are recommended because these components have minimal variation in value and equivalent series resistance (ESR) over temperature and will offer the best AC performance.

JY1105 is stable with an output capacitor to ground. 3.3uF or greater in case of  $V_{out} < 1.2V$ .

1uF or greater in case of  $V_{out} \geq 1.2V$ .

And an input capacitor is also important for the stability of JY1105. Place 1uF or greater between  $V_{in}$  and ground. Input and output capacitors should be placed as close to JY1105 as possible.

### Vout setting of Adjustable Version

Adjustable version uses external feedback resistors to generate an output voltage. The output voltage from 0.8V to 5V are available.  $V_{adj}$  is trimmed to 0.6V and  $V_{out}$  is given by the following equation.

$$V_{out} = V_{adj} * ( 1 + R1 / R2 )$$

Feedback resistors  $R1$  and  $R2$  should be high enough to keep quiescent current low, but increasing  $R1 + R2$  will reduce stability. In general,  $R1$  and  $R2$  in the tens of kohm will produce adequate stability. In the same way as capacitors, place  $R1$  and  $R2$  close to JY1105. Because these form the negative feedback loop of LDO, The distance from resistances to JY1105 influences the stability and other characteristics.

To improve stability characteristics, keep parasitics on the Adj pin to a minimum, and lower  $R1$  and  $R2$  values.

### EN pin

EN pin is Active high. When EN pin is opened or is forced to be low, the Pch MOS pass transistor shuts off, and all internal circuits are powered down. In this standby state, the current consumption decreases to 0.2uA maximum at room temperature. EN pin is pulled down by 4MΩ resistance internally.

### Internal Current Limit

JY1105 has internal over load current limit protection circuit. This limits the Pch MOS pass transistor current to 600mA. So, against excessive load, JY1105 limits it internally and the output voltage falls down.

Finally, when the output is shorted to GND level, the Pch MOS pass transistor current is limited to 100mA. This is Short circuit current (  $I_{short}$  ).

### Thermal Shutdown

JY1105 has thermal shutdown circuit internally. This limits total power dissipation in JY1105.

When the junction temperature  $T_j$  reaches approximately 150°C, the Pch MOS pass transistor shuts off the load current and allows JY1105 to cool. When the junction temperature  $T_j$  falls to approximately 120°C, JY1105 restart the regulation.

### (Note)

Internal current limit circuit or Thermal shutdown circuit cannot completely protect JY1105 from the thermal fault conditions. The maximum output power of JY1105 is limited by the maximum power dissipation of the package. The maximum power dissipation should not exceed the package's maximum power rating.

And for reliable operation, junction temperature should be limited to +125°C maximum.

Power dissipation 'P' :

$$P = (V_{in} - V_{out}) * I_{out}$$

### Output Voltage vs. Load Current
