## Application Information

### PIN ASSIGNMENT

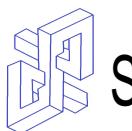

CHRG (Pin 1): Open-Drain Charge Status Output. When the battery is charging, the CHRG pin is pulled low by an internal N-channel MOSFET. When the charge cycle is completed or reverse battery lockout / No AC is detected, CHRG is forced high impedance.

GND (Pin 2): Ground.

BAT (Pin 3): Charge Current Output. It should be bypassed with at least a 1uF capacitor. It Provides charge current to the battery and regulates the final float voltage to 4.2V. An internal precision resistor divider from this pin sets the float voltage which is disconnected in shutdown mode.

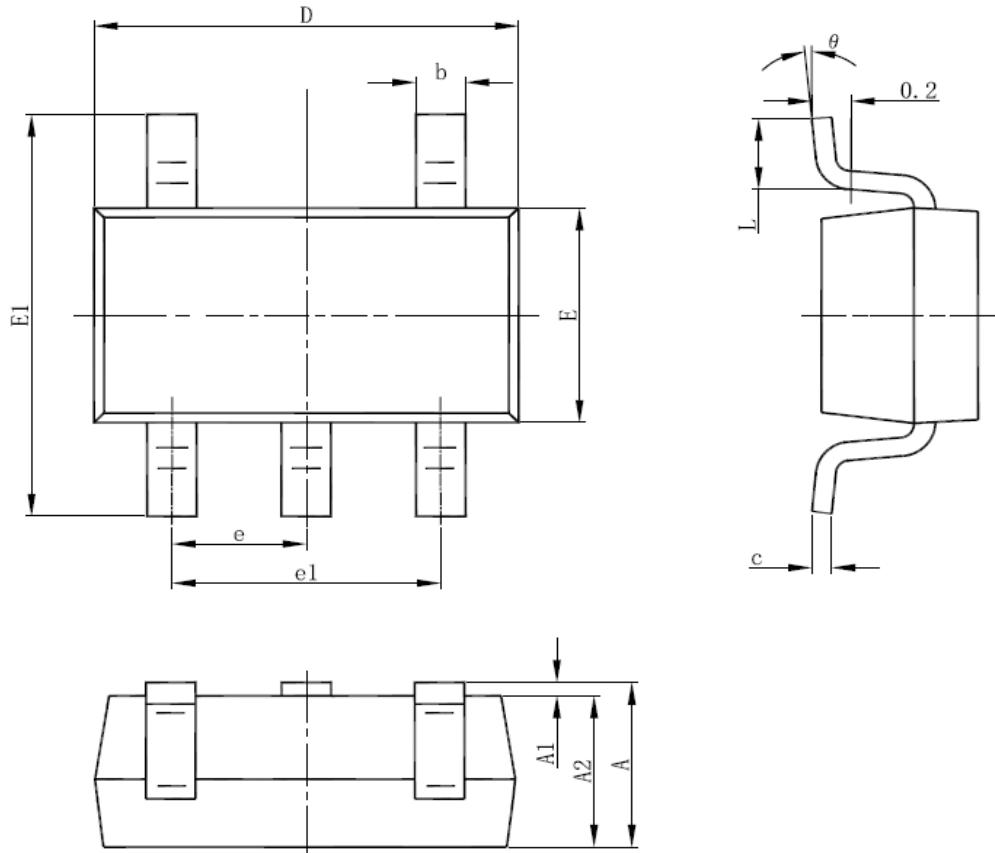

VCC (Pin 4): Positive Input Supply Voltage. It Provides power to the charger VCC can range from 4.30V to 6.5V and should be bypassed with at least a 1uF capacitor. When VCC drops to within 20mV of the BAT pin voltage, the SD8054 enters shutdown mode, dropping IBAT to less than 1 uA.

PROG (Pin 5): Charge Current Program, Charge Current Monitor and Shutdown Pin. The charge current is programmed by connecting a 1% resistor, RPROG, to ground. When charging in constant-current mode, this pin servos to 1V. In all modes, the voltage on this pin can be used to measure the charge current using the following formula:  $IBAT = (VPROG/RPROG)*890$ , The PROG pin can also be used to shut down the charger. Disconnecting the program resistor from ground allows a weak current to pull the PROG pin high. When it reaches the 1.21V shutdown threshold voltage, the charger enters shutdown mode, charging stops and the input supply current drops to 65uA. Reconnecting RPROG to ground will return the charger to .normal operation.
