

## Secondary-Side Synchronous Rectifier

### FEATURES

- ◆ Match DCM and Quasi-Resonant(QR) flyback converter
- ◆ Supports both High-side and Low-side rectification
- ◆ No need external power supply

### APPLICATIONS

- ◆ Adapters/Chargers
- ◆ Flyback converters

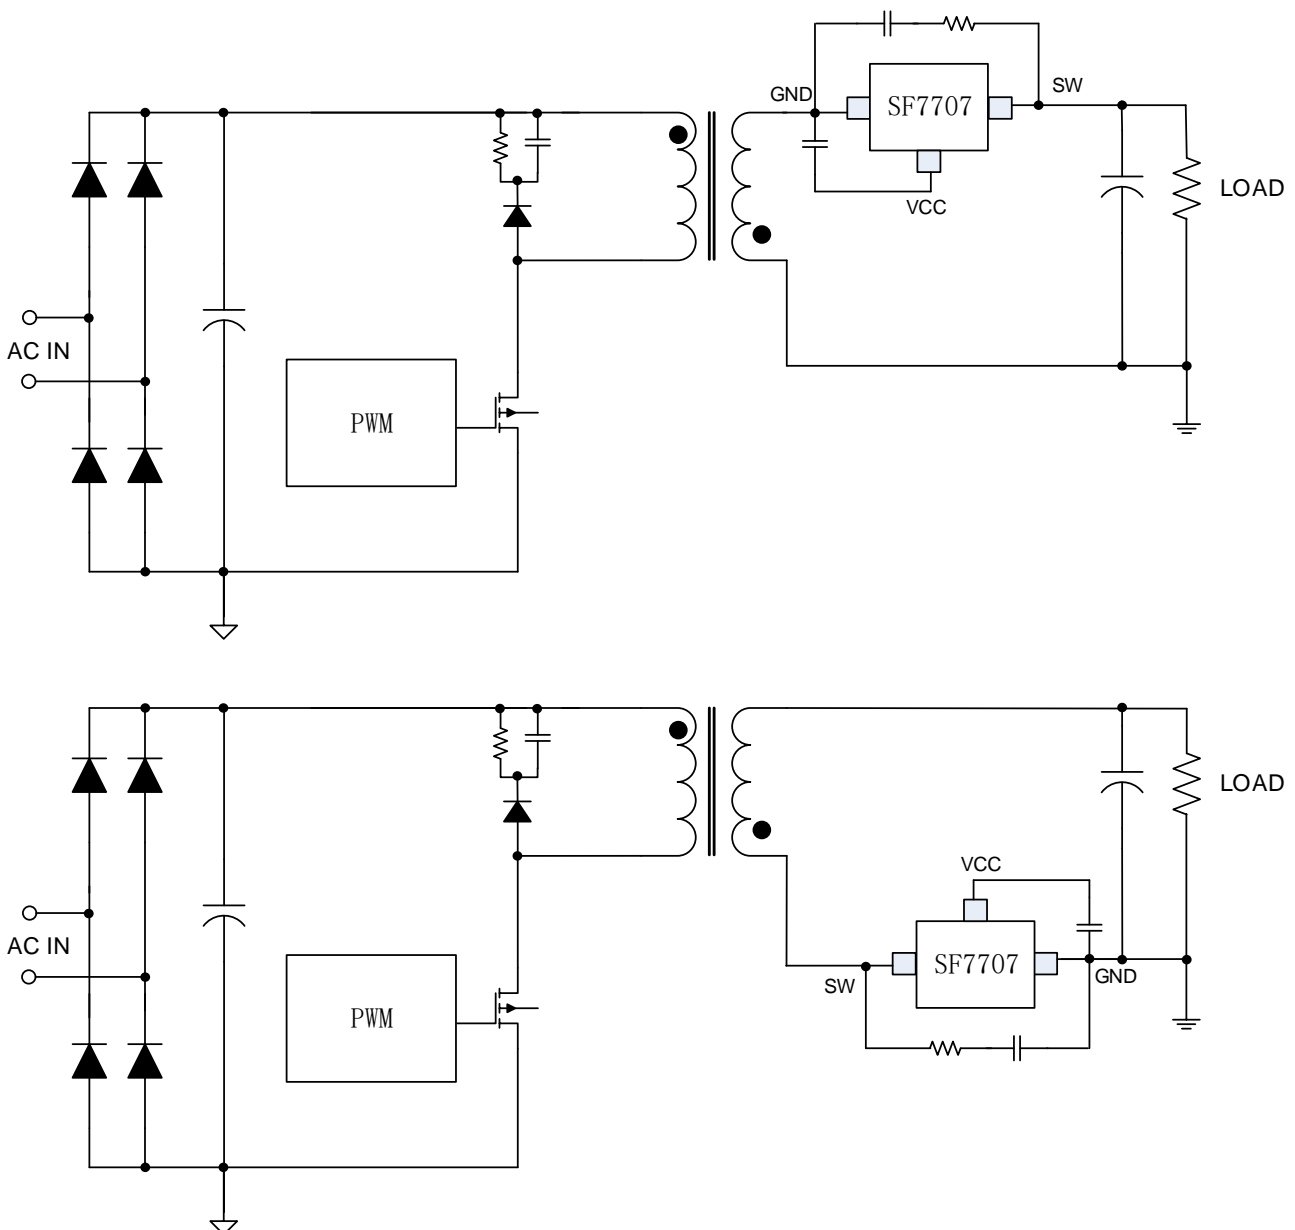

### GENERAL DESCRIPTION

SF7707 is a high performance secondary side switch for synchronous rectification (SR) in DCM operation flyback.

Using SF7707 to replace diode can effectively reduce the secondary side rectifier power dissipation and increase efficiency for system.

SF7707 is offered in SOP8 package.

**Recommended Operation Conditions** (Note 2)

Parameter	Value	Unit
Supply Voltage, VCC	7 to 9	V
Operating Ambient Temperature	-40 to 85	°C

**Note 1.** Stresses beyond those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

**Note 2.** The device is not guaranteed to function outside its operating conditions.

**OPERATION DESCRIPTION**

SF7707 can replace Schottky diode to improve the efficiency in DCM flyback converters. A power supply capacitor is connected between VCC and GND. An internal LDO circuit is adopted for its power supply during the primary switch on time.

◆ **UVLO and Startup Operation**

When the primary switch turns on, the power start from SW pin through LDO to VCC pin. When VCC voltage achieve UVLO(OFF), the SR circuit start to work. And when the VCC voltage drop below UVLO(ON), the SR circuit enter into restart mode.

◆ **Operation Mode**

When the secondary current first flows through the body diode of SR MOSFET, the voltage of SW pin will be lower than  $V_{MOS\_ON}$ , the SR MOSFET turns on and the conduction loss reduce, until the current through SR MOSFET decrease near to 0, which means the voltage of SW recovers to internal MOSFET turn off threshold, the SR MOSFET turns off. As shown in figure 1.

Fig.1 SR turn on and off waveform

◆ **Turn-on Blanking Time**

The control circuitry contains a blanking function. When the internal MOSFET is turned on, it at least last for some time, the turn on blanking time is about 500ns. During the turn on blanking period, the turn off threshold is not totally blanked, but changes the threshold current. This assures that the internal MOSFET can always be turned off even during the blanking period.

◆ **RC Snubber Circuit**

In some applications such as startup, output short protection, the system may go into slight CCM condition. To suppress the reverse spike voltage across the SR MOSFET, a RC snubber circuit is suggested to be place between SW and GND. As shown in figure 2.
