

# FTG for Intel<sup>®</sup> Pentium<sup>®</sup> 4 CPU and Chipsets

#### Features

- Compatible to Intel<sup>®</sup> CK-Titan & CK-408 Clock Synthesizer/Driver Specifications
- System frequency synthesizer for Intel Brookdale 845 and Brookdale - G Pentium<sup>®</sup> 4 Chipsets
- Programmable clock output frequency with less than
   1 MHz increment
- Integrated fail-safe Watchdog timer for system recovery
- Automatically switch to HW selected or SW programmed clock frequency when watchdog timer time-out
- Capable of generating system RESET after a Watchdog timer time-out occurs or a change in output frequency via SMBus interface

- Support SMBus byte read/write and block read/ write operations to simplify system BIOS development
- Vendor ID and Revision ID support
- Programmable drive strength support
- Programmable output skew support
- Power management control inputs
- Available in 48-pin SSOP

| CPU | 3V66 | PCI  | REF | 48M | 24_48M |
|-----|------|------|-----|-----|--------|
| x 3 | x 4  | x 10 | x 2 | x 1 | x 1    |

1. Signals marked with '\*' and "^" has internal pull-up and pull-down resistors respectively.

# **Pin Definitions**

| Pin Name             | Pin No.                   | Pin<br>Type | Pin Description   |
|----------------------|---------------------------|-------------|---|
| X1                   | 3                         | I           | <b>Crystal Connection or External Reference Frequency Input:</b> This pin has dual functions. It can be used as an external 14.318-MHz crystal connection or as an external reference frequency input.  |
| X2                   | 4                         | 0           | <i>Crystal Connection:</i> Connection for an external 14.318-MHz crystal. If using an external reference, this pin must be left unconnected.  |
| REF0/MULTSEL0        | 48                        | I/O         | <b>Reference Clock 0/Current Multiplier Selection 0:</b> 3.3V 14.318-MHz clock<br>output. This pin also serves as a power-on strap option to determine the current<br>multiplier for the CPU clock outputs. The MULTSEL1:0 definitions are as follows:<br>MULTSEL1:0<br>00 = loh is 4 x IREF<br>01 = loh is 5 x IREF<br>10 = loh is 6 x IREF<br>11 = loh is 7 x IREF  |
| REF1/MULTSEL1        | 1                         | I/O         | <b>Reference Clock 1/Current Multiplier Selection 1:</b> 3.3V 14.318-MHz clock<br>output. This pin also serves as a power-on strap option to determine the current<br>multiplier for the CPU clock outputs. The MULTSEL1:0 definitions are as follows:<br>MULTSEL1:0<br>00 = loh is 4 x IREF<br>01 = loh is 5 x IREF<br>10 = loh is 6 x IREF<br>11 = loh is 7 x IREF  |
| CPU0:1, CPU0:1#      | 41, 38, 40,<br>37         | 0           | <b>CPU Clock Outputs:</b> Frequency is set by the FS0:4 inputs or through serial input interface.   |
| CPU_ITP,<br>CPU_ITP# | 44, 45                    | I/O         | <b>CPU Clock Output for ITP:</b> Frequency is set by the FS0:4 inputs or through serial input interface.  |
| 3V66_0:3             | 31, 30, 28,<br>27         | 0           | 66-MHz Clock Outputs: 3.3V fixed 66-MHz clock.  |
| PCI_F0/FS2           | 6                         | I/O         | <i>Free-running PCI Output 0/Frequency Select 2:</i> 3.3V free-running PCI output. This pin also serves as a power-on strap option to determine device operating frequency as described in the Frequency Selection Table.   |
| PCI_F1/FS3           | 7                         | I/O         | <b>Free-running PCI Output 1/Frequency Select 3:</b> 3.3V free-running PCI output. This pin also serves as a power-on strap option to determine device operating frequency as described in the <i>Table 4</i> .   |
| PCI_F2               | 8                         | I/O         | Free-running PCI Output 2: 3.3V free-running PCI output.  |
| PCI0/FS4             | 10                        | I/O         | <b>PCI Output 0/Frequency Select 4:</b> 3.3V PCI output. This pin also serves as a power-on strap option to determine device operating frequency as described in <i>Table 4</i> .   |
| PCI1:6               | 11, 12, 14,<br>15, 16, 17 | 0           | PCI Clock Output 1 to 6: 3.3V PCI clock outputs.  |
| 48MHz/FS0            | 22                        | I/O         | <b>48-MHz Output/Frequency Select 0:</b> 3.3V fixed 48-MHz, non-spread spectrum output. This pin also serves as a power-on strap option to determine device operating frequency as described in <i>Table 4</i> . This output will be used as the reference clock for USB host controller in Intel 845 (Brookdale) platforms. For Intel Brookdale - G platforms, this output will be used as the VCH reference clock.  |
| 24_48MHz/FS1         | 23                        | I/O         | <b>24- or 48-MHz Output/Frequency Select 1:</b> 3.3V fixed 24-MHz or 48-MHz non-spread spectrum output. This pin also serves as a power-on strap option to determine device operating frequency as described in <i>Table 4</i> . This output will be used as the reference clock for SIO devices in Intel 845 (Brookdale) platforms. For Intel Brookdale - G platforms, this output will be used as the reference clock for SIO devices. We recommend system designer to configure this output as 48 MHz and "HIGH Drive" by setting Byte [5], Bit [0] and Byte [9], Bit [7], respectively. |

# Pin Definitions (continued)

| Pin Name  | Pin No.                      | Pin<br>Type           | Pin Description   |
|---|------------------------------|-----------------------|---|
| PWR_DWN#  | 42                           | I                     | <b>Power Down Control:</b> 3.3V LVTTL-compatible input that places the device in power-down mode when held LOW.   |
| SCLK  | 26                           | I                     | SMBus Clock Input: Clock pin for serial interface.  |
| SDATA   | 25                           | I/O                   | SMBus Data Input: Data pin for serial interface.  |
| RST#  | 20                           | O<br>(open-<br>drain) | System Reset Output: Open-drain system reset output.  |
| IREF  | 35                           | I                     | <i>Current Reference for CPU Output:</i> A precision resistor is attached to this pin which is connected to the internal current reference.   |
| VTT_PWRGD#  | 19                           | I                     | <b>Powergood from Voltage Regulator Module (VRM):</b> 3.3V LVTTL input.<br>VTT_PWRGD# is a level-sensitive strobe used to determine when FS0:4 and<br>MULTSEL0:1 inputs are valid and OK to be sampled (Active LOW). Once<br>VTT_PWRGD# is sampled LOW, the status of this input will be ignored. |
| VDD_REF,<br>VDD_PCI,<br>VDD_48MHz,<br>VDD_3V66,<br>VDD_CPU  | 2, 9, 18, 24,<br>32, 39, 46  | Ρ                     | <b>3.3V Power Connection:</b> Power supply for CPU outputs buffers, 3V66 output buffers, PCI output buffers, reference output buffers and 48-MHz output buffers. Connect to 3.3V.   |
| GND_PCI,<br>GND_48MHz,<br>GND_3V66,<br>GND_CPU,<br>GND_REF, | 5, 13, 21, 29,<br>36, 43, 47 | G                     | Ground Connection: Connect all ground pins to the common system ground plane.   |
| VDD_CORE  | 34                           | Р                     | <b>3.3V Analog Power Connection:</b> Power supply for core logic, PLL circuitry. Connect to 3.3V.   |
| GND_CORE  | 33                           | G                     | Analog Ground Connection: Ground for core logic, PLL circuitry.   |

#### Serial Data Interface

To enhance the flexibility and function of the clock synthesizer, a two-signal serial interface is provided. Through the Serial Data Interface, various device functions such as individual clock output buffers, etc. can be individually enabled or disabled.

The register associated with the Serial Data Interface initializes to its default setting upon power-up, and therefore use of this interface is optional. Clock device register changes are normally made upon system initialization, if any are required. The interface can also be used during system operation for power management functions.

#### **Data Protocol**

The clock driver serial protocol accepts byte write, byte read, block write and block read operation from the controller. For block write/read operation, the bytes must be accessed in sequential order from lowest to highest byte (most significant bit first) with the ability to stop after any complete byte has been transferred. For byte write and byte read operations, the system controller can access individual indexed bytes. The offset of the indexed byte is encoded in the command code, as described in *Table 1*.

The block write and block read protocol is outlined in *Table 2* while *Table 3* outlines the corresponding byte write and byte read protocol.

The slave receiver address is 11010010 (D2h).

#### Table 1. Command Code Definition

| Bit | Descriptions   |
|-----|--|
| 7   | 0 = Block read or block write operation<br>1 = Byte read or byte write operation   |
| 6:0 | Byte offset for byte read or byte write operation. For block read or block write operations, these bits should be '0000000'. |

#### Table 2. Block Read and Block Write Protocol

|       | Block Write Protocol   |       | Block Read Protocol  |
|-------|--|-------|--|
| Bit   | Description  | Bit   | Description  |
| 1     | Start  | 1     | Start  |
| 2:8   | Slave address – 7 bits   | 2:8   | Slave address – 7 bits   |
| 9     | Write  | 9     | Write  |
| 10    | Acknowledge from slave   | 10    | Acknowledge from slave   |
| 11:18 | Command Code – 8 bits<br>'00000000' stands for block operation | 11:18 | Command Code – 8 bits<br>'00000000' stands for block operation |
| 19    | Acknowledge from slave   | 19    | Acknowledge from slave   |
| 20:27 | Byte Count – 8 bits  | 20    | Repeat start   |
| 28    | Acknowledge from slave   | 21:27 | Slave address – 7 bits   |
| 29:36 | Data byte 0 – 8 bits   | 28    | Read   |
| 37    | Acknowledge from slave   | 29    | Acknowledge from slave   |
| 38:45 | Data byte 1 – 8 bits   | 30:37 | Byte count from slave – 8 bits                                 |
| 46    | Acknowledge from slave   | 38    | Acknowledge  |
|       | Data Byte N/Slave Acknowledge                                  | 39:46 | Data byte from slave – 8 bits                                  |
|       | Data Byte N – 8 bits   | 47    | Acknowledge  |
|       | Acknowledge from slave   | 48:55 | Data byte from slave – 8 bits                                  |
|       | Stop   | 56    | Acknowledge  |
|       |  |       | Data bytes from slave/Acknowledge                              |
|       |  |       | Data byte N from slave – 8 bits                                |
|       |  |       | Not Acknowledge  |
|       |  |       | Stop   |

#### Table 3. Byte Read and Byte Write Protocol

|       | Byte Write Protocol  |       | Byte Read Protocol   |
|-------|--|-------|--|
| Bit   | Description  | Bit   | Description  |
| 1     | Start  | 1     | Start  |
| 2:8   | Slave address – 7 bits   | 2:8   | Slave address – 7 bits   |
| 9     | Write  | 9     | Write  |
| 10    | Acknowledge from slave   | 10    | Acknowledge from slave   |
| 11:18 | Command Code - 8 bits<br>'1xxxxxx' stands for byte operation<br>bit[6:0] of the command code represents the<br>offset of the byte to be accessed | 11:18 | Command Code - 8 bits<br>'1xxxxxx' stands for byte operation<br>bit[6:0] of the command code represents the<br>offset of the byte to be accessed |
| 19    | Acknowledge from slave   | 19    | Acknowledge from slave   |
| 20:27 | Data byte – 8 bits   | 20    | Repeat start   |
| 28    | Acknowledge from slave   | 21:27 | Slave address – 7 bits   |
| 29    | Stop   | 28    | Read   |
|       |  | 29    | Acknowledge from slave   |
|       |  | 30:37 | Data byte from slave – 8 bits  |
|       |  | 38    | Not Acknowledge  |
|       |  | 39    | Stop   |

#### Programmable Output Frequency, Watchdog Timer and Recovery Output Frequency Functional Description

The Programmable Output Frequency feature allows users to generate any CPU output frequency in the range of 50 MHz to 248 MHz. Cypress offers the most dynamic and the simplest programming interface for system developers to utilize this feature in their platforms.

The Watchdog Timer and Recovery Output Frequency features allow users to implement a recovery mechanism when the system hangs or getting unstable. System BIOS or other control software can enable the Watchdog timer before they attempt to make a frequency change. If the system hangs and a Watchdog Timer time-out occurs, a system reset will be generated and a recovery frequency will be activated.

All the related registers are summarized in Table 5.

#### Table 5. Register Summary

| Name                                  | Description   |
|---------------------------------------|---|
| Pro_Freq_EN                           | Programmable output frequencies enabled<br>0 = Disabled (default)<br>1 = Enabled<br>When it is disabled, the operating output frequency will be determined by either the latched value of<br>FS[4:0] inputs or the programmed value of SEL[4:0]. If the FS_Override bit is clear, latched FS[4:0]<br>inputs will be used. If the FS_Override bit is set, the programmed value of SEL[4:0] will be used.<br>When it is enabled, the CPU output frequency will be determined by the programmed value of<br>CPUFSEL_N, CPUFSEL_M and the PLL Gear Constant. The program value of FS_Override, SEL[4:0]<br>or the latched value of FS[4:0] will determine the PLL Gear Constant and the frequency ratio between<br>CPU and other frequency outputs                  |
| FS_Override                           | <ul> <li>When Pro_Freq_EN is cleared or disabled,</li> <li>0 = Select operating frequency by FS input pins (default)</li> <li>1 = Select operating frequency by SEL bits in SMBus control bytes</li> <li>When Pro_Freq_EN is set or enabled,</li> <li>0 = Frequency output ratio between CPU and other frequency groups and the PLL Gear Constant are based on the latched value of FS input pins (default)</li> <li>1 = Frequency output ratio between CPU and other frequency groups and the PLL Gear Constant are based on the latched value of FS input pins (default)</li> <li>1 = Frequency output ratio between CPU and other frequency groups and the PLL Gear Constant are based on the programmed value of SEL bits in SMBus control bytes</li> </ul> |
| CPU_FSEL_N,<br>CPU_FSEL_M             | When Prog_Freq_EN is set or enabled, the values programmed in CPU_FSEL_N[7:0] and CPU_FSEL_M[6:0] determines the CPU output frequency. The new frequency will start to load whenever there is an update to either CPU_FSEL_N[7:0] or CPU_FSEL_M[6:0]. Therefore, it is recommended to use Word or Block write to update both registers within the same SMBus bus operation. The setting of FS_Override bit determines the frequency ratio for CPU, AGP and PIC. When FS_Override is cleared or disabled, the frequency ratio follows the latched value of the FS input pins. When FS_Override is set or enabled, the frequency ratio follows the programmed value of SEL bits in SMBus control bytes.   |
| ROCV_FREQ_SEL                         | ROCV_FREQ_SEL determines the source of the recover frequency when a Watchdog timer time-out occurs. The clock generator will automatically switch to the recovery CPU frequency based on the selection on ROCV_FREQ_SEL.<br>0 = From latched FS[4:0]<br>1 = From the settings of ROCV_FREQ_N[7:0] & ROCV_FREQ_M[6:0]  |
| ROCV_FREQ_N[7:0],<br>ROCV_FREQ_M[6:0] | When ROCV_FREQ_SEL is set, the values programmed in ROCV_FREQ_N[7:0] and<br>ROCV_FREQ_M[6:0] will be used to determine the recovery CPU output frequency when a<br>Watchdog timer time-out occurs<br>The setting of the FS_Override bit determines the frequency ratio for CPU, AGP and PIC. When it is<br>cleared, the same frequency ratio stated in the Latched FS[4:0] register will be used.<br>When it is set, the frequency ratio stated in the SEL[4:0] register will be used.<br>The new frequency will start to load whenever there is an update to either ROCV_FREQ_N[7:0] and<br>ROCV_FREQ_M[6:0]. Therefore, it is recommended to use Word or Block write to update both registers<br>within the same SMBus bus operation.                         |
| WD_EN                                 | 0 = Stop and reload Watchdog Timer<br>1 = Enable Watchdog Timer. It will start counting down after a frequency change occurs.   |
| WD_TO_STATUS                          | Watchdog Timer Time-out Status bit<br>0 = No time-out occurs (READ); Ignore (WRITE)<br>1 = Time-out occurred (READ); Clear WD_TO_STATUS (WRITE)   |

#### Table 5. Register Summary (continued)

| Name          | Description  |
|---------------|--|
| WD_TIMER[4:0] | These bits store the time-out value of the Watchdog Timer. The scale of the timer is determine by the prescaler.<br>The timer can support a value of 150 ms to 4.8 sec when the prescaler is set to 150 ms. If the prescaler is set to 2.5 sec, it can support a value from 2.5 sec to 80 sec.<br>When the Watchdog timer reaches "0", it will set the WD_TO_STATUS bit. |
| WD_PRE_SCALER | 0 = 150 ms<br>1 = 2.5 sec  |
| RST_EN_WD     | This bit will enable the generation of a Reset pulse when a Watchdog timer time-out occurs.<br>0 = Disabled<br>1 = Enabled   |
| RST_EN_FC     | This bit will enable the generation of a Reset pulse after a frequency change occurs.<br>0 = Disabled<br>1 = Enabled   |

#### Program the CPU Output Frequency

When the programmable output frequency feature is enabled (Pro\_Freq\_EN bit is set), the CPU output frequency is determined by the following equation:

Fcpu = G \* (N+3)/(M+3)

"N" and "M" are the values programmed in Programmable Frequency Select N-Value Register and M-Value Register, respectively.

"G" stands for the PLL Gear Constant, which is determined by the programmed value of FS[4:0] or SEL[4:0]. The value is listed in *Table 4*.

The ratio of (N+3) and (M+3) need to be greater than "1" [(N+3)/(M+3) > 1].

The following table lists set of N and M values for different frequency output ranges. This example use a fixed value for the M-Value Register and select the CPU output frequency by changing the value of the N-Value Register.

#### Table 6. Examples of N and M Value for Different CPU Frequency Range

| Frequency Ranges | Gear Constants | Fixed Value for<br>M-Value Register | Range of N-Value Register<br>for Different CPU Frequency |
|------------------|----------------|-------------------------------------|--|
| 50 MHz–129 MHz   | 48.00741       | 93                                  | 97–255   |
| 130 MHz–248 MHz  | 48.00741       | 45                                  | 127–245  |

Notes:

All parameters specified with loaded outputs.
 Duty cycle is measured at 1.5V when V<sub>DD</sub> = 3.3V. When V<sub>DD</sub> = 2.5V, duty cycle is measured at 1.25V.
 Determined as a fraction of 2\*(t<sub>RP</sub> - t<sub>RN</sub>)/(t<sub>RP</sub> +t<sub>RN</sub>) Where t<sub>RP</sub> is a rising edge and t<sub>RN</sub> is an intersecting falling edge.
 The test load is R<sub>s</sub> = 33.2Ω, R<sub>p</sub> = 49.9Ω in test circuit.

#### Cycle-Cycle Clock Jitter

Layout Example

Note: Each supply plane or strip should have a ferrite bead and capacitors All bypass caps =  $0.1 \,\mu\text{F}$  ceramic

\* For use with onboard video using 48 MHz for Dot Clock or connect to VDDQ3

#### **Ordering Information**

| Ordering Code | Package Type                               | Operating Range |
|---------------|--|-----------------|
| CY28323PVC    | 48-pin Small Shrunk Outline Package (SSOP) | Commercial      |
