1 Design Overview

BT111 development kit is targeted for engineers evaluating BT111 *Bluetooth Smart Ready HCI module* and developing or prototyping *Bluetooth* Smart Ready systems utilizing BT111 module. BT111 Development Kit features:

- BT111 development board including
  - USB connector
  - Header for direct current consumption measurements
  - Reset button
  - Power on LED
  - Header for SPI interface for setting the parameters through SPI
    - All I/Os and supply voltages exposed with 2.54 mm pitch for connecting the kit on prototyping board using a pin header
- Bluegiga on-board installation kit (SPI cable)
- Ribbon cable and an adapter PCB for connecting the SPI with Bluegiga on-board installation kit
- BT111-A sample module

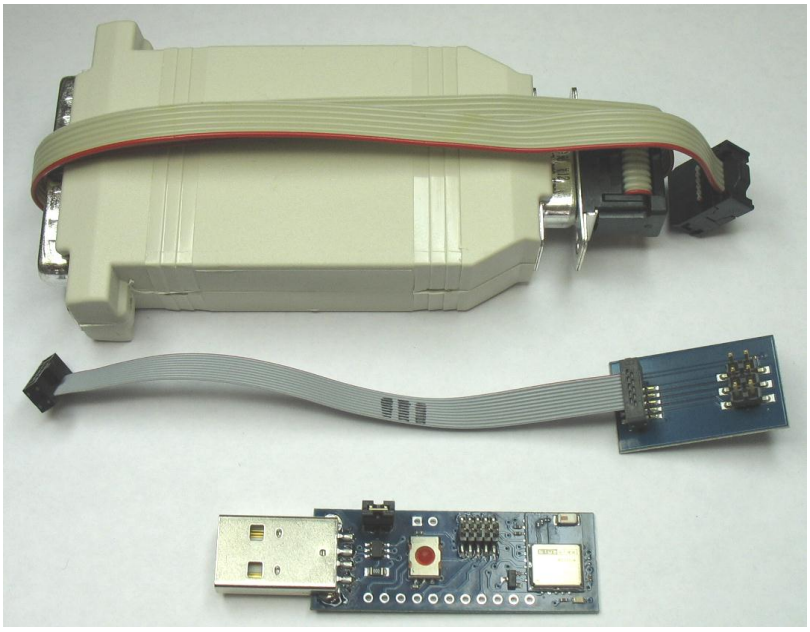

Figure 1: DKBT111, SPI adapter and programming cable

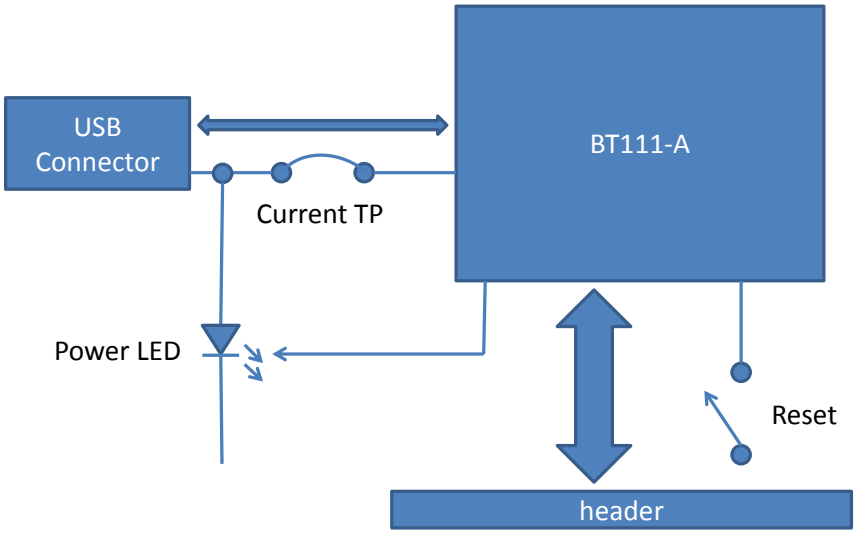

Figure 2: DKBT111 Block Diagram

Please refer to the latest datasheet of BT111 for information about the BT111 module. The physical outlook of the development board is shown in Figure 3 below.

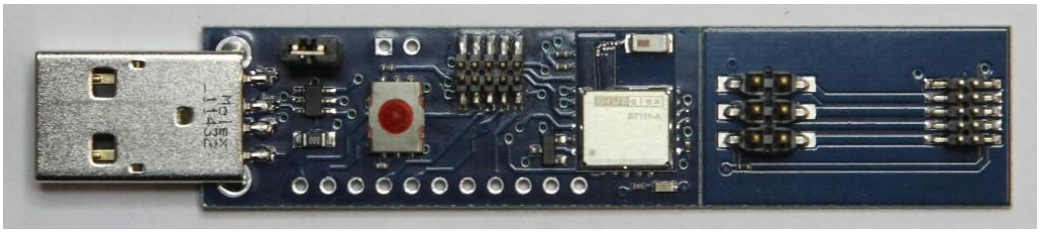

Figure 3: DKBT111

2 Using DKBT111 for the First Time

As shown in the Figure 3 in previous chapter, the SPI adapter board is attached to the development board. When you start using DKBT111, it is important to first break the adapter off from the development kit. This assures proper operation of the chip antenna. Figure 4 shows the development kit with SPI adapter removed and attached to the on-board installation kit.

The configuration and test tool suite BlueSuite can be downloaded at the Bluegiga Tech Forum. Please restart your computer after installing BlueSuite like the installer requests. The SPI transport may not work otherwise.

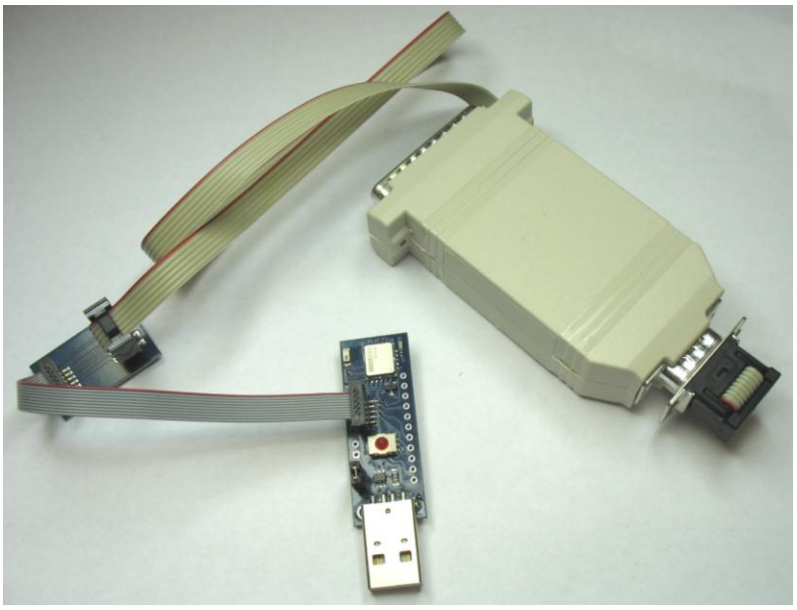

Figure 4: On-board installation kit connected to DKBT111

2.1 Configuring PS keys over SPI

1. Connect DKBT111 to the USB port of a PC
2. Make sure the power LED turns on
3. Connect the SPI programming cable to the PC and to the SPI interface on the DKBT111
4. Open **PSTool** application and select SPI as the transport as shown in the figure below

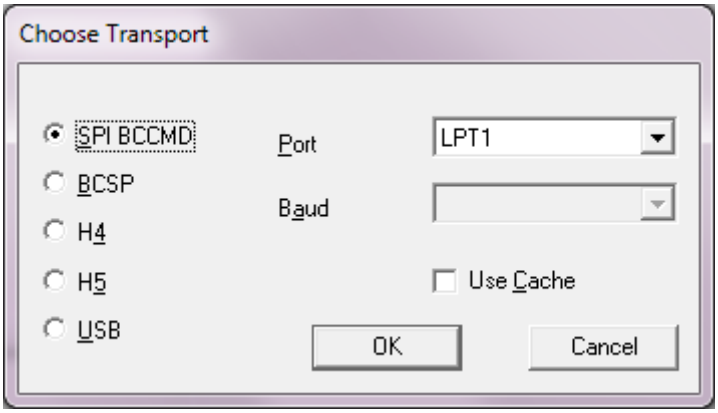

Figure 5: Choosing transport

You can now modify the PS-keys that are stored on BT111's EEPROM.

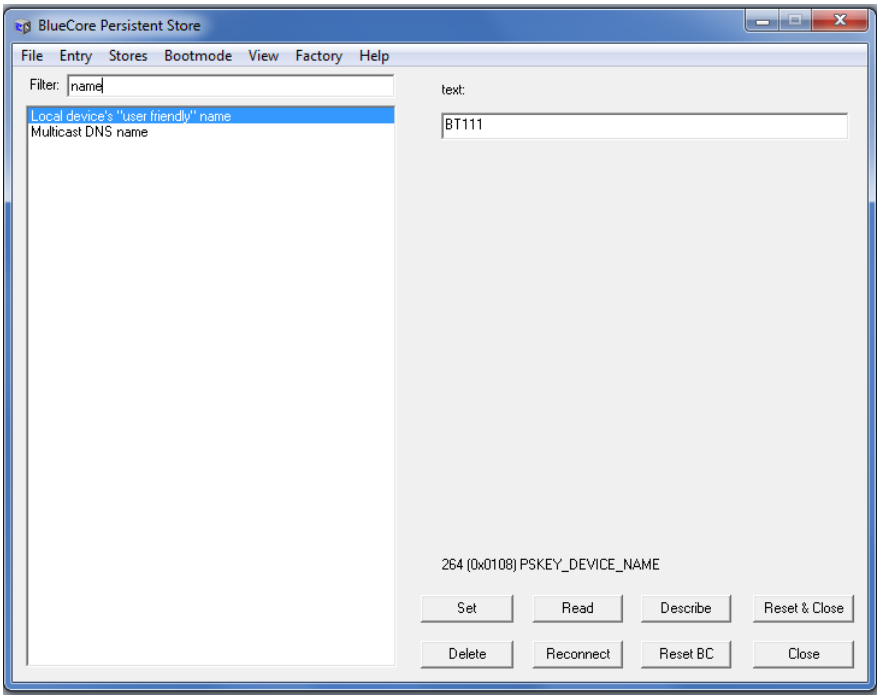

Figure 6: Changing the device friendly name

Note:

Do not modify the PS-keys unless you are absolutely sure what the change will do or unless you are advised to change a PS-key by Bluegiga.

2.2 Configuring PS keys over USB

Because BT111 is recognized as a generic *Bluetooth* radio by the operating system, the OS will load its own *Bluetooth* stack drivers for the BT111. In order to modify the PS-keys via USB interface a special USB driver needs to be installed.

In order to install the USB driver, please do the following steps:

1. Download the BT111 USB driver from Tech Forum
2. Start ***Device Manager*** from Windows ***Control Panel***
3. Right-click on the ***Generic Bluetooth Adapter***, then select ***Update Driver Software…***
4. Choose ***Browse my computer for driver software.***

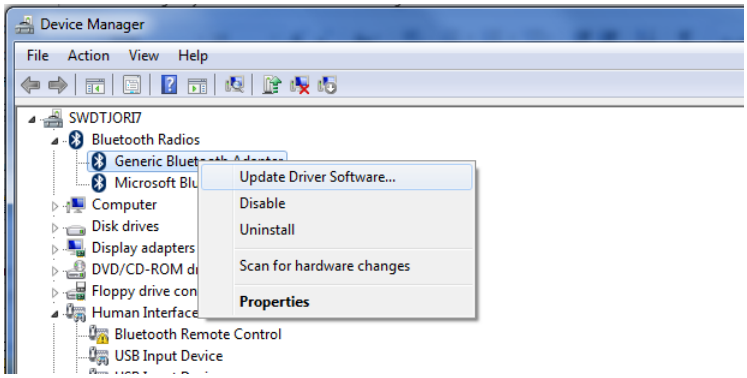

Figure 7: Update driver software

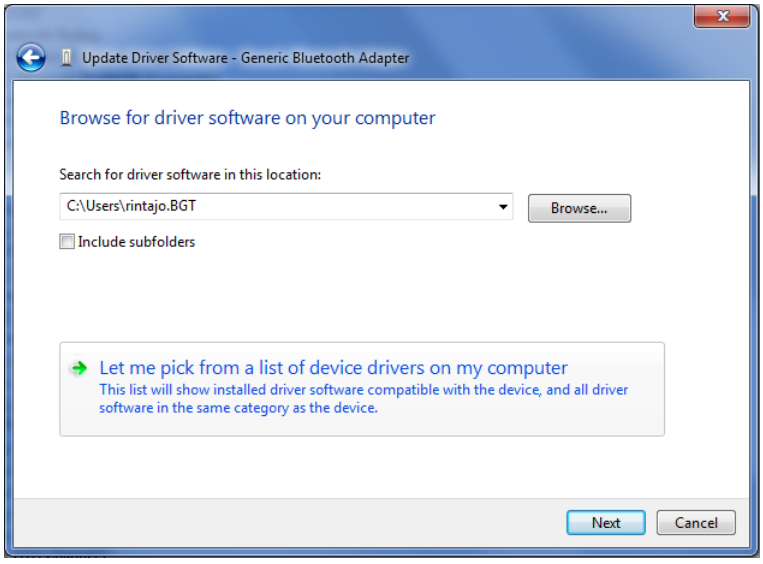

Figure 8. Browse for driver software

1. Click on ***Let me pick from a list of device drivers on my computer***, then click ***Have Disk…***
2. Select the location where you saved the BT111 USB drivers

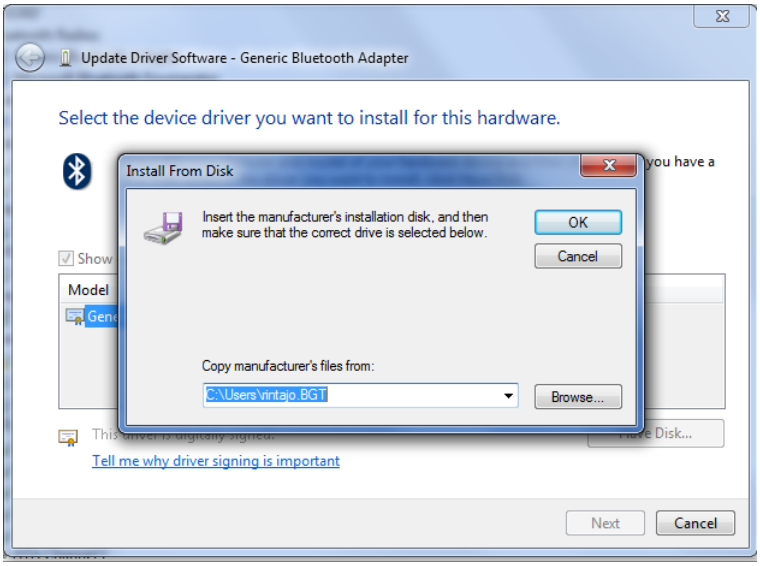

Figure 9: Install from disk

1. Windows will warn that the driver is not digitally signed; choose to install anyway.

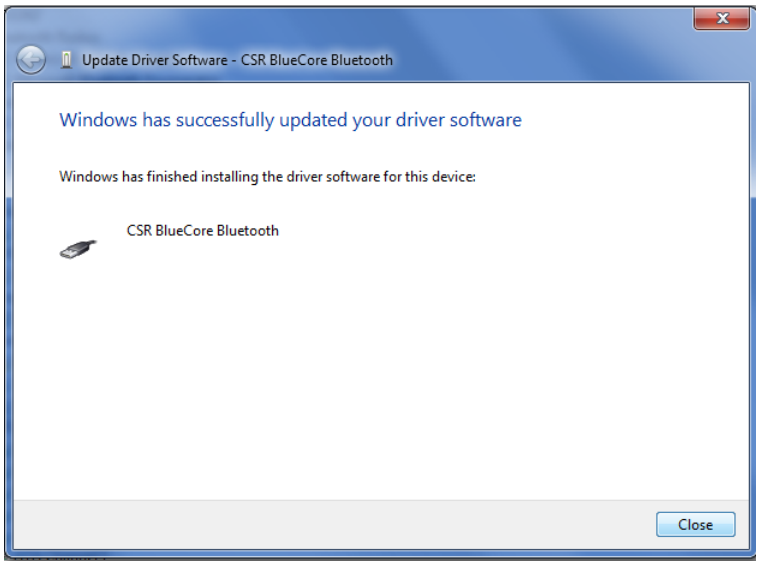

Figure 10. Installation successful

When the installation completes, BT111 will re-enumerate as a "***CSR BlueCore Bluetooth***", and can now be accessed with **PSTool** software. In PStool Select USB as the transport, the port field will be automatically filled with "\\.\csr0".

When you wish to return to normal operation, you can repeat the procedure to select a driver from a list, but this time select the Microsoft Generic *Bluetooth* Adapter driver.
