

## Dual Channel 1A and 4A, 5.0kV<sub>RMS</sub> Isolated Gate Driver

### GENERAL DESCRIPTION

The SLMi823x isolated driver family is an isolated dual channel gate driver with different configurations. The SLMi8230/1/3/4 are configured as high-side/low-side drivers, while the SLMi8232/5 are configured as dual drivers. The peak source output current of SLMi8230/1/2 is 1.0A and the peak source output current of SLMi8233/4/5 is 4.0A. Programmable dead time (DT) feature is available in SLMi8230/1/3/4. Pulling high the DIS pin shuts down both outputs simultaneously, and allows for normal operation when the DIS pin is open or pulled low. As a fail-safe measure, primary-side logic failures force both outputs low.

The VDDA and VDDB supply voltage are up to 40 V. A wide input VDDI range from 3 V to 18 V makes the driver suitable for interfacing with both analog and digital controllers. All the supply voltage pins have under voltage lock-out (UVLO) protection.

The SLMi823x has 5.0kV<sub>RMS</sub> isolation in SOP16W package per UL1577.

High CMTI, low propagation delay, small size and flexible configuration make the SLMi823x family is suitable for a wide range of isolated MOSFET/IGBT and SiC or GaN FET gate drive applications.

### FEATURE

- 1.0A or 4.0A peak source current
- 40ns (Typ.) propagation delay
- 18ns (Max.) pulse width distortion
- 18ns (Max.) delay matching
- 100kV/us (Min.) common mode transient immunity (CMTI)
- Wide input voltage: 3V to 18V
- Up to 40V driver output voltage
- 5V reverse polarity voltage handling capability on input stage
- 1500V functional isolation between two drivers
- Operating temperature: -40°C to +125°C
- Safety certifications:
  - 5kVRMS isolation for 1 minute per UL 1577 with SOP16W package
  - CQC certification per GB4943.1-2011
  - TUV certification per EN/IEC 61010-1: 2010+A1 and EN/IEC 62368-1: 2018
  - DIN V VDE 0884-11 (Planned)

### APPLICATION

- AC/DC or DC/DC power supplies in server, telecom and industry
- DC/AC solar inverters
- EV battery charging

## PIN DESCRIPTION

**Table 1. SLMi8230/3 Pin Description**

No.	Pin	Description
1	VIA	Input of driver A. The output of driver A is in phase with the input. This pin is pulled low internally if left open. Recommend to connect this pin to ground if not used for better noise immunity.
2	VIB	Input of driver B. The output of driver B is in phase with the input. This pin is pulled low internally if left open. Recommend to connect this pin to ground if not used for better noise immunity.
3	VDDI	Input power supply. A local low ESR and ESL capacitor should be connected between VDDI and GNDI.
4	GNDI	Input power ground.
5	DIS	Device disable input. When DIS pin is high, both driver is disabled and driver output is low. When DIS pin is low, it allows the device to perform in normal operation.
6	DT	Dead time programming input. Connect a resistor between DT and GNDI to program the dead time. A bypassing capacitor, 2.2nF or greater, is recommended to be put between DT and GNDI to achieve better noise immunity.
7	NC	No connection
8	VDDI	Input power supply. This pin is internally connected to pin3.
9	GNDB	Power ground of driver B.
10	VOB	Output of driver B.
11	VDDB	Power supply of driver B. A local low ESR and ESL capacitor should be connected between VDDB and GNDB.
12	NC	No connection
13	NC	No connection
14	GNDA	Power ground of driver A.
15	VOA	Output of driver A.
16	VDDA	Power supply of driver A. A local low ESR and ESL capacitor should be connected between VDDA and GNDA.

**Table 2. SLMi8231/4 Pin Description**

No.	Pin	Description
1	PWM	PWM input. The output of driver A is in phase with PWM input and the output of driver B is out of phase with PWM input.
2	NC	No connection
3	VDDI	Input power supply. A local low ESR and ESL capacitor should be connected between VDDI and GNDI.
4	GNDI	Input power ground.
5	DIS	Device disable input. When DIS pin is high, both driver is disabled and driver output is low. When DIS pin is low, it allows the device to perform in normal operation.
6	DT	Dead time programming input. Connect a resistor between DT and GNDI to program the dead time. A bypassing capacitor, 2.2nF or greater, is recommended to be put between DT and GNDI to achieve better noise immunity.

**CMTI Testing**

Figure 11 is the simplified diagram of the CMTI testing. Common mode voltage is set to 1000V.

Figure 11. CMTI Test Circuit

## FEATURE DESCRIPTION

SLMi823x is a flexible dual channel isolated gate driver that can drive IGBTs and MOSFETs. It has 1.0A or 4.0A peak output current capability with maximum output driver supply voltage of 40V. SLMi823x has many features that allow it to integrate well with control circuitry and protect the gates it drives such as: resistor programmable dead time control, an DIS pin, and under voltage lock out (UVLO) for both input and output voltages.

### Under Voltage Lockout

The SLMi823x has under voltage lock out (UVLO) protection feature on each driver power supply voltage between the VDDA (VDDDB) and GNDA (GNDB) pins. When the VDDx voltage is lower than  $V_{UVLO\_VDDX\_R}$ , during device start up or lower than  $V_{UVLO\_VDDX\_F}$ , after start up, the VDDA (VDDDB) UVLO feature holds the driver output low, regardless of the status of the input pins. A hysteresis on the UVLO feature prevents glitch when there is noise from the power supply.

The SLMi823x also monitors the input power supply and there is an internal under voltage lock out protection feature on the VDDI. The driver outputs (VOA and VOB) are hold low when the voltage on the VDDI is lower than  $V_{UVLO\_VDDI\_R}$  during start up or lower than  $V_{UVLO\_VDDI\_F}$  after start up. There is a hysteresis on the VDDI UVLO feature to prevent glitch due the noise on the VDDI power supply.

### Disable Input Function

When the DIS is pulled high, the VOA and VOB are pulled low regardless of the states of VIA and VIB. When the DIS pin is pulled low, the VOA and VOB are allowed for normal operation and controlled by the VIA and VIB.

The DIS input has no effect if VDDI is below its UVLO threshold and VOA, VOB remain low. There is an internal pull down resistor on the DIS pin.

### Control Input and Output Logic

The VIA and VIB input controls the corresponding output channel, VOA and VOB. A logic high signal on VIA (VIB) causes the output of VOA (VOB) to go high. And a logic low on VIA (VIB) causes the output of VOA (VOB) to go low.

For PWM input versions (SLMi8231/4), when the PWM input is high, the VOA is high and VOB is low. And when the PWM input is low, the VOA is low and VOB is high.

The Table 4 and Table 5 show the relationship between VIA, VIB, PWM, DIS, UVLO and Output of VOA and VOB.

Table 4. Relationship between Input and Output with VIA, VIB input (SLMi8230/2/3/5)

### Dead-time Program

For the high side/low side configuration driver, there is a dead-time between VOA and VOB. The dead-time delay ( $t_{DT}$ ) is programmed by a resistor ( $R_{DT}$ ) connected from the DT input to ground and it can be calculated with below equation.

$$t_{DT}[\text{ns}] \approx 10 \times R_{DT}[\text{k}\Omega]$$

Here,  $t_{DT}$  is the dead-time delay,  $R_{DT}$  is the resistance value between DT and ground.

The DT pin can be connected to VDDI or left floating to provide a nominal dead time at approximately 400 ps.

A bypassing capacitor, 2.2nF or greater, is recommended to be put between DT and GNDI to achieve better noise immunity.

The Figure 12 shows the input and output logic with dead-time in different condition.

Figure 12. Input and output logic with dead-time

Condition A: VIA goes high and VIB goes low. VOB goes low immediately and VOA goes high after the programmed dead-time.

Condition B: VIA goes low and VIB goes high. VOA goes low immediately and VOB goes high after the programmed dead-time.

Condition C: VIB goes low and VIA still low. VOB goes low immediately. Since the VIA input dead-time is longer than the programmed dead-time, the VOA goes high immediately when the VIA input goes high.

Condition D: VIA goes low and VIB still low. VOA goes low immediately. Since the VIB input dead-time is longer than the programmed dead-time, the VOB goes high immediately when the VIB input goes high.

Condition E: VIA goes high while VIB and VOB are still high, the overlap time is shorter than the programmed dead-time. To avoid overshoot, VOB goes low immediately when the VIA goes high. The VOA goes high after the programmed dead-time.

Condition F: VIB goes high while VIA and VOA are still high, the overlap time is shorter than the programmed dead-time. To avoid overshoot, VOA goes low immediately when the VIB goes high. The VOB goes high after the programmed dead-time.

Condition G: VIA goes high while VIB and VOB are still high, the overlap time is longer than the programmed dead-time. To avoid overshoot, VOB goes low immediately when the VIA goes high. Since the overlap time is longer than the programmed dead-time, the VOA goes high immediately when the VIB goes low.

Condition H: VIB goes high while VIA and VOA are still high, the overlap time is longer than the programmed dead-time. To avoid overshoot, VOA goes low immediately when the VIB goes high. Since the overlap time is longer than the programmed dead-time, the VOB goes high when the VIA goes low.

**APPLICATION INFORMATION**

The circuit in Figure 13 shows the typical application circuit for SLMi823x to driver a typical half bridge configuration which could be used in several popular power converter topologies such as synchronous buck, synchronous boost, half bridge, full bridge, LLC etc. topologies and 3-phase motor drive applications.

## REVISION HISTORY

Note: page numbers for previous revisions may differ from page numbers in current version

Page or Item	Subjects (major changes since previous revision)
<b>Rev 1.0 datasheet: 2021-12-30</b>	
Whole document	Initial release
<b>Rev 1.1 datasheet: 2022-10-25</b>	
Page 9	Update the values in the absolute maximum ratings table
Page 10	Add thermal information
Page 11	Add the test condition in the Insulation specifications
Page 12	Add safety related certifications Add safety limiting values
Page 13, 14	Updated the $I_{VDDI}$ , $R_{PD}$ , $V_{OH}$ , $V_{OL}$ and add the $I_{VDDA}$ , $I_{Vddb}$ in the electrical characteristics (DC) table
Page 14	Update $t_{PwD}$ , $t_{DM}$ in the switching characteristics (AC) table
<b>Rev 1.2 datasheet: 2023-05-05</b>	
Page 11	Updated the $V_{IOTM}$ value
Page 12	Add the TUV certification in Safety Related Certifications
Page 13	Updated the $R_{PD}$ max value
<b>Rev 1.3 datasheet: 2023-07-03</b>	
Page 12	Add the TUV certification No: R 50590519
