### Description

The SKY12329-350LF is a monolithic GaAs, binary-weighted, 5-bit, single positive control voltage digital attenuator which operates from 400 MHz–4 GHz. The attenuator has a least significant bit (LSB) of 1 dB and total attenuation of 31 dB. The two RF ports are bilateral; each can be used as the RF input or the RF output. This attenuator requires an external supply voltage of 2.7–5.5 V.

The SKY12329-350LF is comprised of 5 fixed attenuators in cascade, each of which having a shunt bypass switch. Beginning at the LSB, which is 1 dB, each succeeding fixed attenuator produces twice the attenuation of the preceding stage. The state of each bypass switch is controlled by the logic level voltage applied to the associated control voltage input; a logic high voltage closes the associated switch, thereby

bypassing that fixed attenuator stage, and a logic low opens the switch to force the input signal to that stage through the associated attenuator.

DC power consumption is very low, 100  $\mu$ A maximum with control voltage and supply voltage of 5 V. The switch can operate over the temperature range of -40 °C to +85 °C.

An evaluation board is available upon request.

**NEW** Skyworks offers lead (Pb)-free, RoHS (Restriction of Hazardous Substances)-compliant packaging.

Exceeding any of the absolute maximum/minimum specifications may result in permanent damage to the device and will void the warranty.

**CAUTION:** Although this device is designed to be as robust as possible, ESD (Electrostatic Discharge) can damage this device. This device must be protected at all times from ESD. Static charges may easily produce potentials of several kilovolts on the human body or equipment, which can discharge without detection. Industry-standard ESD precautions must be employed at all times.

### Evaluation Board

The evaluation board for SKY12329-350LF allows the part to be fully exercised. The insertion loss of the transmission lines between J<sub>1</sub>–U<sub>1</sub> and U<sub>1</sub>–J<sub>2</sub> can be determined by measuring the performance of the calibration through line, which contains two DC block capacitors (560 pF) in identical positions to the DC blocks present in the main circuit.

The state of the SKY12329-350LF is controlled by applying the appropriate logic level voltages to ports V<sub>1</sub> through V<sub>5</sub>, per the Truth Table
