

## Low Dropout Regulators

### Description

SL9500 Series is high accuracy, very low quiescent current, low-dropout linear regulator able to provide 500mA load current.

SL9500 Series features very fast response against line voltage transient and load current transient, and ensures no overshoot voltage during the LDO start up and short circuit recovery.

SL9500 Series integrated short circuit protection, current limiting protection and thermal protection function. By putting the EN pin down to turn on shutdown mode.

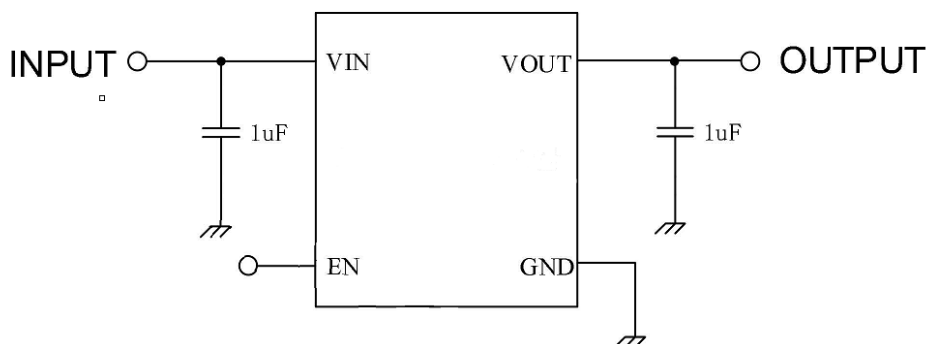

### Features

- Wide Input Voltage Range: 1.8V~6V
- Maximum Output Current: 500mA
- Standard Fixed Output Voltage Options: 1.2V, 1.8V, 2.5V, 2.8V, 3V, 3.3V, 3.6V, etc
- Low Quiescent Current: 800nA
- PSRR=60dB@1KHz
- Low Dropout: 130mV @ 100mA
- Low Output Voltage Accuracy:  $\pm 2\%$
- Short Circuit Protection
- Current Limiting Protection
- Thermal Shutdown Protection
- Available Packages: SOT-23, SOT-23-3, SOT-89, SOT-23-5, DFN1x1-4L and SOT-89-5

### Applications

- Battery-Powered Equipment
- Smoke Detector and Sensor
- Micro Controller Applications

## Functional Description

### Input Capacitor

A 1 $\mu$ F ceramic capacitor is recommended to connect between VIN and GND pins to decouple input power supply glitch and noise. The amount of the capacitance may be increased without limit. This input capacitor must be located as close as possible to the device to assure input stability and less noise. For PCB layout, a wide copper trace is required for both VIN and GND. The input capacitor should be at least equal to, or greater than, the output capacitor for good load transient performance.

### Output Capacitor

An output capacitor is required for the stability of the LDO. The recommended output capacitance is from 1 $\mu$ F to 10 $\mu$ F, Equivalent Series Resistance (ESR) is from 5m $\Omega$  to 500m $\Omega$ , and temperature characteristics are X7R or X5R. Higher capacitance values help to improve load/line transient response. The output capacitance may be increased to keep low undershoot/overshoot. Place output capacitor as close as possible to OUT and GND pins.

### ON/OFF Input Operation

The SL9500 EN pin is internally held low by a 1-M $\Omega$  resistor to GND. The PJ9500 is turned on by setting the EN pin higher than VIH threshold, and is turned off by pulling it lower than VIL threshold. If this feature is not used, the EN pin should be tied to IN pin to keep the regulator output on at all time.

### Low Quiescent Current

Cellular phone baseband internal digital circuits typically operate all the time. That requires LDO stays on at all times. However, in the standby mode, the microprocessor consumes only around 100~300 $\mu$ A. Since the phone stays in standby for the longest percentage of time, using a 0.8 $\mu$ A quiescent current LDO, instead of 100 $\mu$ A, saves 99.2 $\mu$ A and can substantially extend the battery standby time.

The SL9500, consuming only 0.8 $\mu$ A quiescent current, provides great power saving in portable and low power applications.

### Current Limit Protection

When output current at the OUT pin is higher than current limit threshold or the OUT pin is short-circuiting to GND, the current limit protection will be triggered and clamp the output current to a pre-set level to prevent over-current and to protect the regulator from damage due to overheating.

### Thermal Overload Protection

The 9500 has internal thermal protection. When the temperature is too high, such as a short circuit in the output pins or a device with a very large load current and a large voltage drop, the internal thermal protection circuit will be triggered, which will shut down the power supply MOSFET and prevent LDO damage. Once the excessive thermal conditions are eliminated and the temperature of the device drops, the thermal protection circuit will restore control of the power MOSFET and allow the LDO device to enter normal operation
