## Description

The 74LCX125 device is a low-voltage CMOS quad bus buffer manufactured with sub-micron silicon gate and double-layer metal wiring $\mathrm{C}^{2} \mathrm{MOS}$ technology. It is ideal for low-power and highspeed 3.3 V applications and can be interfaced to a 5 V signal environment for both inputs and outputs.
The device requires the 3-state control input $\overline{\mathrm{G}}$ to be set high to place the output in the high impedance state.

It has the same speed performance at 3.3 V as the 5 V AC/ACT family, combined with lower power consumption.
All inputs and outputs are equipped with protection circuits against static discharge, giving them 2 kV ESD immunity and transient excess voltage.

Average operating current can be obtained by the following equation. $I_{C C(o p r)}=C_{P D} \times V_{C C} \times f_{I N}+I_{C C} / 4$ (per gate).
