L9637

## Monolithic bus driver with ISO 9141 interface

## Features

■ Operating power supply voltage range $4.5 \mathrm{~V} \leq \mathrm{V}_{\mathrm{S}} \leq 36 \mathrm{~V}$ (40 V for transients)

- Reverse supply (battery) protected down to $\mathrm{V}_{\mathrm{S}} \geq-24 \mathrm{~V}$
- Standby mode with very low current consumption $\mathrm{IS}_{\mathrm{SB}} \leq 1 \mathrm{~mA} @ \mathrm{~V}_{\mathrm{CC}} \leq 0.5 \mathrm{~V}$
- Low quiescent current in off condition IS $_{\text {OFF }}=120 \mu \mathrm{~A}$
- TTL compatible TX input
- Bidirectional K-I/O pin with supply voltage dependent input threshold
- Overtemperature shut down function Selective to K-I/O pin
- Wide input and output voltage range $-24 \mathrm{~V} \leq \mathrm{V}_{\mathrm{K}} \leq \mathrm{V}_{\mathrm{S}}$
- K output current limitation, typ. $I_{K}=60 \mathrm{~mA}$
- Defined OFF output status in undervoltage condition and $\mathrm{V}_{\mathrm{S}}$ or GND interruption
- Controlled output slope for low EMI

- High input impedance for open $\mathrm{V}_{\mathrm{S}}$ or GND connection
■ Defined output ON status of LO or RX for open LI or K inputs
- Defined K output OFF for TX input open

■ Integrated pull up resistors for TX, RX and LO
■ EMI robustness optimized

## Description

The L9637 is a monolithic integrated circuit containing standard ISO 9141 compatible interface functions.

## Block diagram and pin description

### 1.1 Block diagram

Figure 1. Block diagram

### 1.2 Pin description

Figure 2. Pin connection (top view)

Table 2. Pin description

| N. | Name | Function |
| :---: | :---: | :--- |
| 1 | RX | Output for K as input |
| 2 | LO | Output L comparator |
| 3 | VCC | Stabilized voltage supply |
| 4 | TX | Input for K as output |
| 5 | GND | Common GND |
| 6 | K | Bidirectional I/O |
| 7 | VS | Supply voltage |
| 8 | LI | Input L comparator |

## 2 Electrical specification

### 2.1 Absolute maximum ratings

Table 3. Absolute maximum ratings (No damage or latch)

| Symbol | Parameter | Value | Unit |
| :---: | :--- | :---: | :---: |
| $\mathrm{V}_{\mathrm{S}}$ | Supply voltage ISO transients <br> $\mathrm{t}=400 \mathrm{~ms}$ | -24 to +36 <br> -24 to +40 | V |
| $\mathrm{~V}_{\mathrm{CC}}$ | Stabilized voltage | -0.3 to +7 | V |
| $\Delta \mathrm{~V}_{\mathrm{S}} / \mathrm{d}_{\mathrm{t}}$ | Supply voltage transient | -10 to +10 | $\mathrm{~V} / \mu \mathrm{s}$ |
| $\mathrm{V}_{\mathrm{LI}, \mathrm{K}}$ | Pin voltage | -24 to $\mathrm{V}_{\mathrm{S}}$ | V |
| $\mathrm{V}_{\mathrm{LO}, \mathrm{RX}, \mathrm{TX}}$ |  | -24 to $\mathrm{V}_{\mathrm{CC}}$ | V |

Note: $\quad$ Max. ESD voltages are $\pm 2 k V$ with human body model $C=100 \mathrm{pF}, R=1.5 \mathrm{k}$ corresponds to maximum energy dissipation 0.2 mJ according to MIL883C.

### 2.2 Thermal data

Table 4. Thermal data

| Symbol | Parameter | Min. | Typ. | Max. | Unit |
| :---: | :--- | :---: | :---: | :---: | :---: |
| $\mathrm{T}_{\text {JSDon }}$ | Temperature K shutdown switch on threshold | 160 | - | 200 | ${ }^{\circ} \mathrm{C}$ |
| $\mathrm{T}_{\text {JSDoff }}$ | Temperature K shutdown switch off threshold | 150 | - | 200 | ${ }^{\circ} \mathrm{C}$ |
| $\mathrm{R}_{\text {th j-amb }}$ | Thermal steady state junction to ambient resistance | 130 | 155 | 180 | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |

### 2.3 Electrical characteristics

The electrical characteristics are valid within the below defined operating conditions, unless otherwise specified. The function is guaranteed by design until $\mathrm{T}_{\text {JSDon }}$ temperature shutdown switch-on-threshold.

Table 5. Electrical characteristics

| Symbol | Parameter | Test condition | Min. | Typ. | Max. | Unit |
| :---: | :--- | :--- | :---: | :---: | :---: | :---: |
| $\mathrm{V}_{\mathrm{S}}$ | Supply voltage | - | 4.5 | - | 36 | V |
| $\mathrm{~V}_{\mathrm{CC}}$ | Stabilized voltage | see note ${ }^{(1)}$ | 3 | 5 | 7 | V |
| $\mathrm{~T}_{\mathrm{j}}$ | Junction temperature | - | -40 | - | 150 | ${ }^{\circ} \mathrm{C}$ |
| $\mathrm{I}_{\mathrm{CC}}$ | Supply $\mathrm{V}_{\mathrm{CC}}$ current | $\mathrm{V}_{\mathrm{CC}} \leq 5.5 \mathrm{~V} ; \mathrm{VLI}, \mathrm{VTX}=0 \mathrm{~V}$ | - | 1.4 | 2.3 | mA |
|  |  | -5 | $<1$ | 5 | $\mu \mathrm{~A}$ |  |

## $3 \quad$ Functional description

The L9637 is a monolithic bus driver designed to provide bidirectional serial communication in automotive diagnostic applications according to the specification "Diagnostic Systems ISO9141".

The device provides a bidirectional link, called K , to the $\mathrm{V}_{\mathrm{Ba}}{ }^{\mathrm{t}}$ related diagnosis bus. It also includes a separate comparator $L$ which is also able to be linked to the $V_{B a}{ }^{t}$ bus. The input TX and output RX of K are related to $\mathrm{V}_{\mathrm{CC}}$ with her integrated pull up resistances. Also the L comparator output LO has a pull up resistance connected to $\mathrm{V}_{\mathrm{Cc}}$.
The maximum external pull up resistance at K related to $\mathrm{V}_{\mathrm{S}}$ should not be higher than $\mathrm{R}_{\mathrm{KO}} \leq$ $5 \mathrm{k} \Omega$ to achieve clear output ON conditions.

All $\mathrm{V}_{\text {Bat }}$ bus defined inputs LI and K have supply voltage dependent thresholds together with sufficient hysteresis to suppress line spikes. These pins are protected against overvoltages, shorts to GND and $\mathrm{V}_{\mathrm{S}}$ and can also be driven beyond $\mathrm{V}_{\mathrm{S}}$ and GND.
These features are also given for TX, RX and LI only taking into account the behavior of the internal pull up resistances. The thermal shut down function switches OFF the K output if the chip temperature increases above the thermal shut down threshold. To reactivate K again the temperature must decrease below the $K$ switch ON temp. To achieve no fault for $\mathrm{V}_{\mathrm{S}}$ undervoltage conditions the outputs will be switched OFF and stay at high impedance.
The device is also protected against reverse battery condition. During lack of $\mathrm{V}_{\mathrm{S}}$ or GND all pins shows high impedance characteristic. To realize a lack of the $\mathrm{V}_{\mathrm{S}}$ related bus line LI and K the outputs LO and RX shows defined ON status.

Suppressing all 4 classes of "Schaffner" signals all pins can be load with short energy pulses of max. $\pm 0.2 \mathrm{~mJ}$. All these features together with a high possible baud rate $>50 \mathrm{Kbaud}$, controlled output slopes for low EMI, a wide power supply voltage range and a very small quiescent current during OFF (TX LI K=High) condition $\mathrm{IS}_{\text {off typ }} \leq 120 \mu \mathrm{~A}$, and a real standby function with zero power consumption $\mathrm{IS}_{\mathrm{SB} \text { typ }} \leq 1 \mu \mathrm{~A}$ during system de powering $\mathrm{V}_{\mathrm{CC}} \leq 0.5 \mathrm{~V}$ make this device high efficient for automotive bus system.
After wake up of the system from OFF or SB condition the first output signal will have an additional delay time $\operatorname{td}_{\mathrm{typ}} \leq 5 \mu \mathrm{~s}$ see also Figure 5 .
The typical output voltage behavior for the K, LO, RX outputs as a function of the output current is shown in Figure 6. Figure 7 shows a waveform of the output signal when the low level changes from $R_{O N}{ }^{*} l_{O U T}$ to $l_{O U T} * 2 * R_{O N}+U_{B E}$ state. This variation occurs due to too low output current or after a negative transient forced to the output or to the supply voltage line.
