## CURRENT CONTROLLER FOR STEPPING MOTORS

## DESCRIPTION

The L6506/D is a linear integrated circuit designed to sense and control the current in stepping motors and similar devices. When used in conjunction with the L293, L298, L7150, L6114/L6115, the chip set forms a constant current drive for an inductive load and performs all the interface function from the control logic thru the power stage.
Two or more devices may be synchronized using the sync pin. In this mode of operation the oscillator in the master chip sets the operating frequency in all chips.

## CIRCUIT OPERATION

The L6506 is intended for use with dual bridge drivers, such as the L298, quad darlington arrays, such as the L7150, quad DMOS array such as L6114L6115, or discrete power transistors to drive stepper motors and other similar loads. The main function of the device is to sense and control the current in each of the load windings.
A common on-chip oscillator drives the dual chopper and sets the operating frequency for the pulse width modulated drive. The RC network on pin 1 sets the operating frequency which is given by the equation

$$
f=\frac{1}{0.69 R C} \text { for } R>10 K
$$

The oscillator provides pulses to set the two flipflops which in turn cause the outputs to activate the drive. When the current in the load winding reaches the programmed peak value, the voltage across the sense resistor ( $\mathrm{R}_{\text {sense }}$ ) is equal to $\mathrm{V}_{\text {ref }}$ and the corresponding comparator resets its flip-flop interrupting the drive current until the next oscillator pulse occurs. The peak current in each winding is programmed by selecting the value of the sense resis-
tor and $\mathrm{V}_{\text {ref. }}$ Since separate inputs are provided for each chopper, each of the loads may be programmed independently allowing the device to be used to implement microstepping of the motor. Lower threshold of L6506's oscillator is $1 / 3 \mathrm{Vcc}$. Upper threshold is $2 / 3 \mathrm{~V}_{\mathrm{cc}}$ and internal discharge resistor is $1 \mathrm{~K} \Omega \pm 30 \%$.
Ground noise problems in multiple configurations can be avoided by synchronizing the oscillators. This may be done by connecting the sync pins of each of the devices with the oscillator output of the master device and connecting the $\mathrm{R} / \mathrm{C}$ pin of the unused oscillators to ground.
The equations for the active time of the sync pulse (T2), the inactive time of the sync signal (T1) and the duty cycle can be found by looking at the figure 1 and are :

$$
\begin{gather*}
\mathrm{T} 2=0.69 \mathrm{C} 1 \frac{\mathrm{R} 1 \mathrm{RiN}}{\mathrm{R} 1+\mathrm{RiN}}  \tag{1}\\
\mathrm{~T} 1=0.69 \mathrm{R} 1 \mathrm{C} 1  \tag{2}\\
\mathrm{DC}=\frac{\mathrm{T} 2}{\mathrm{~T} 1+\mathrm{T} 2} \tag{3}
\end{gather*}
$$

By substituting equations 1 and 2 into equation 3 and solving for the value of R1 the following equations for the external components can be derived :

$$
\begin{align*}
\mathrm{R} 1 & =\left(\frac{1}{\mathrm{DC}}-2\right) \mathrm{RIN}  \tag{4}\\
\mathrm{C} 1 & =\frac{\mathrm{T} 1}{0.69 \mathrm{R} 1} \tag{5}
\end{align*}
$$

Looking at equation 1 it can easily be seen that the minimum pulse width of T 2 will occur when the value of R1 is at its minimum and the value of R1 at its maximum. Therefore, when evaluating equation 4 the minimum value for R 1 of $700 \Omega$ ( $1 \mathrm{~K} \Omega-30 \%$ ) should be used to guarantee the required pulse width.

Figure 1 : Oscillator Circuit and Waveforms.

## APPLICATIONS INFORMATION

The circuits shown in figure 2 use the L6506 to implement constant current drives for stepper motors. Figure 2 shows the L6506 used with the L298 to drive a 2 phase bipolar motor. The peak current can be calculated using the equation :

$$
I_{\text {peak }}=\frac{V_{\text {ref }}}{R_{\text {sense }}}
$$

The circuit of Fig. 2 can be used in applications requiring different peak and hold current values by modifying the reference voltage.

The L6506 may be used to implement either full step or half step drives. In the case of 2 phase bipolar stepper motor applications, if a half step drive is used, the bridge requires an additional input to disable the power stage during the half step. If used in conjunction with the L298 the enable inputs may be used for this purpose.

For quad darlington array in 4 phase unipolar motor applications half step may be implemented using the 4 phase inputs.
The L6506 may also be used to implement microstepping of either bipolar or unipolar motors.
