

Wide bandwidth dual JFET operational amplifiers

Features

- Low power consumption
- Wide common-mode (up to V_{CC}⁺) and differential voltage range
- Low input bias and offset current
- Output short-circuit protection
- High input impedance JFET input stage
- Internal frequency compensation
- Latch up free operation
- High slew rate 16 V/µs (typical)

Description

These circuits are high speed JFET input dual operational amplifiers incorporating well matched, high voltage JFET and bipolar transistors in a monolithic integrated circuit.

The devices feature high slew rates, low input bias and offset currents, and low offset voltage temperature coefficient.

Schematics LF253, LF353

1 Schematics

Figure 1. Schematic diagram (each amplifier)

2 Absolute maximum ratings and operating conditions

Table 1. Absolute maximum ratings

Symbol	Parameter	Value	Unit
V _{CC}	Supply voltage ⁽¹⁾	±18	V
V _i	Input voltage ⁽²⁾	±15	V
V _{id}	Differential input voltage ⁽³⁾	±30	V
R _{thja}	Thermal resistance junction to ambient ⁽⁴⁾ SO-8 DIP8	125 85	°C/W
R _{thjc}	Thermal resistance junction to case ⁽⁴⁾ SO-8 DIP8	40 41	°C/W
	Output short-circuit duration ⁽⁵⁾	Infinite	
T _{stg}	Storage temperature range	-65 to +150	°C
	HBM: human body model ⁽⁶⁾	1	kV
ESD	MM: machine model ⁽⁷⁾	200	V
	CDM: charged device model ⁽⁸⁾	1.5	kV

All voltage values, except differential voltage, are with respect to the zero reference level (ground) of the supply voltages where the zero reference level is the midpoint between V_{CC}⁺ and V_{CC}⁻.

- 2. The magnitude of the input voltage must never exceed the magnitude of the supply voltage or 15 volts, whichever is less.
- 3. Differential voltages are the non-inverting input terminal with respect to the inverting input terminal.
- 4. Short-circuits can cause excessive heating and destructive dissipation. Values are typical.
- 5. The output may be shorted to ground or to either supply. Temperature and/or supply voltages must be limited to ensure that the dissipation rating is not exceeded
- 6. Human body model: a 100 pF capacitor is charged to the specified voltage, then discharged through a 1.5 kΩ resistor between two pins of the device. This is done for all couples of connected pin combinations while the other pins are floating.
- 7. Machine model: a 200 pF capacitor is charged to the specified voltage, then discharged directly between two pins of the device with no external series resistor (internal resistor < 5 Ω). This is done for all couples of connected pin combinations while the other pins are floating.
- 8. Charged device model: all pins and the package are charged together to the specified voltage and then discharged directly to the ground through only one pin. This is done for all pins.

Table 2. Operating conditions

Symbol	Parameter	LF253	LF353	Unit
V _{CC}	Supply voltage	6 to	36	V
T _{oper}	Operating free-air temperature range	-40 to +105	0 to +70	°C

Electrical characteristics LF253, LF353

3 Electrical characteristics
