

## RobuST precision dual operational amplifier

Datasheet - production data

- Designed and manufactured to meet sub ppm quality goals
- Advanced mold and frame designs for superior resilience to harsh environments (acceleration, EMI, thermal, humidity)
- Extended screening capability on request
- Single fabrication, assembly and test site
- Temperature range (-40 °C to 125 °C)

### Applications

- Aerospace and defense
- Harsh environments

### Description

The RT512A device is a high-performance, dual operational amplifier with frequency and phase compensation built into the chip. The internal phase compensation allows stable operation in voltage follower configurations in spite of its high gain bandwidth.

The circuit presents very stable electrical characteristics over the entire supply voltage range and it is particularly intended for aerospace and defense applications.

### Features

- Low input offset voltage: 500  $\mu$ V max. (A version)
- Low power consumption
- Short-circuit protection
- Low distortion, low noise
- High gain bandwidth product: 3 MHz
- High channel separation
- ESD protection 2 kV
- Macromodel included in this specification
- Intended for use in aerospace and defense applications:
  - Dedicated traceability and part marking
  - Approval documents available for production parts
  - Adapted extended life time and obsolescence management
  - Extended product change notification process

# 1 Absolute maximum ratings and operating conditions

**Table 1. Absolute maximum ratings**

Symbol	Parameter	Value	Unit
$V_{CC}$	Supply voltage	$\pm 18$	V
$V_{in}$	Input voltage	$\pm V_{CC}$	
$V_{id}$	Differential input voltage	$\pm(V_{CC} - 1)$	
$R_{thja}$	Thermal resistance junction-to-ambient <sup>(1)</sup>	125	°C/W
$R_{thjc}$	Thermal resistance junction-to-case <sup>(1)</sup>	40	
$T_j$	Junction temperature	150	°C
$T_{stg}$	Storage temperature range	-65 to 150	
ESD	HBM: human body model <sup>(2)</sup>	2	kV
	MM: machine model <sup>(3)</sup>	200	V
	CDM: charged device model <sup>(4)</sup>	1.5	kV

1. Short-circuits can cause excessive heating and destructive dissipation.  $R_{th}$  are typical values.
2. Human body model: a 100 pF capacitor is charged to the specified voltage, then discharged through a 1.5 k $\Omega$  resistor between two pins of the device. This is done for all couples of connected pin combinations while the other pins are floating.
3. Machine model: a 200 pF capacitor is charged to the specified voltage, then discharged directly between two pins of the device with no external series resistor (internal resistor < 5  $\Omega$ ). This is done for all couples of connected pin combinations while the other pins are floating.
4. Charged device model: all pins and the package are charged together to the specified voltage and then discharged directly to ground through only one pin. This is done for all pins.

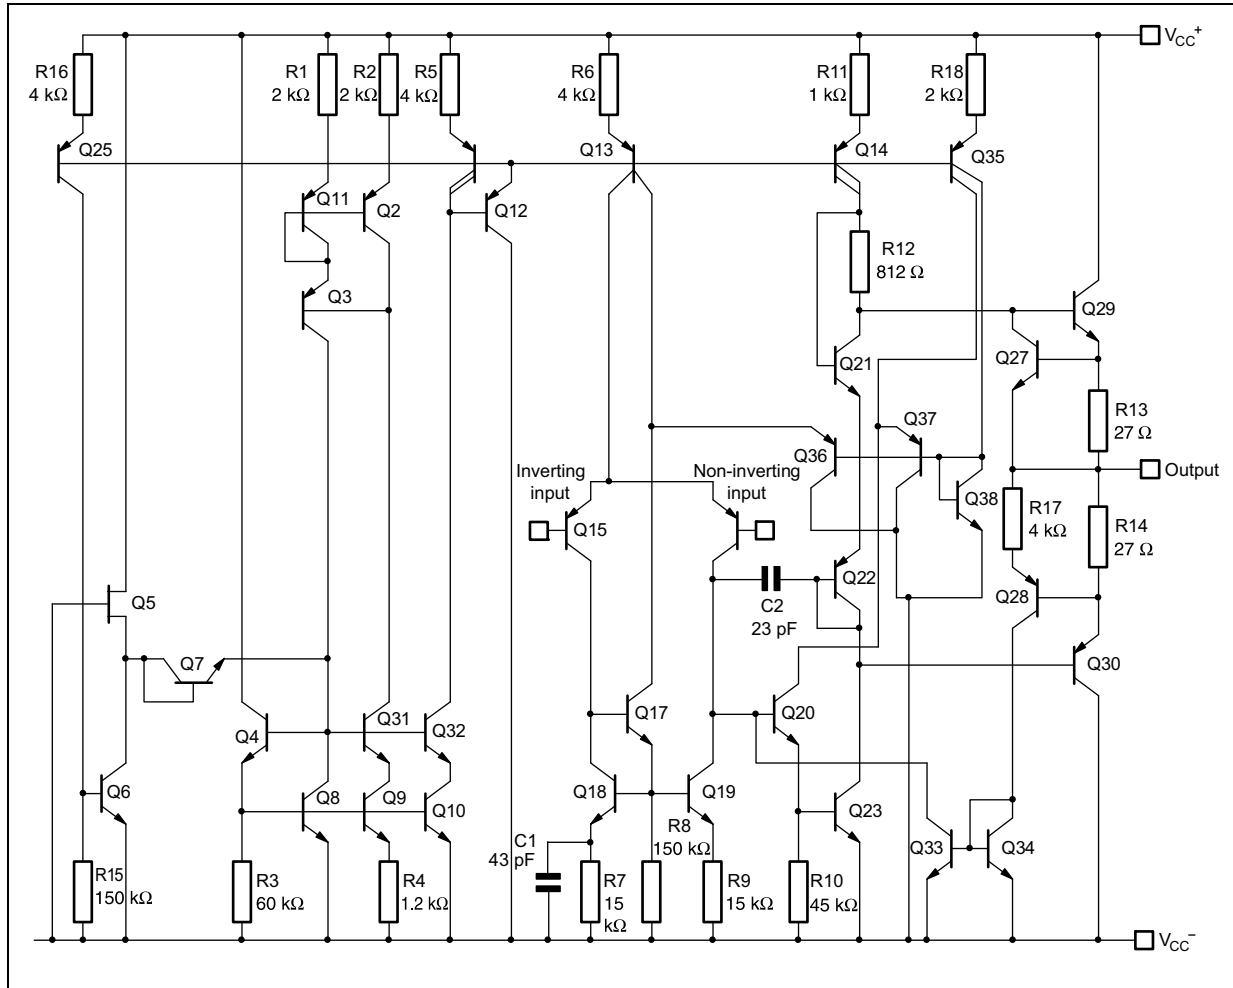

**Table 2. Operating conditions**

## 4 Macromodel

### 4.1 Important notes concerning this macromodel

- All models are a trade-off between accuracy and complexity (i.e. simulation time).
- Macromodels are not a substitute for breadboarding; rather, they confirm the validity of a design approach and help to select surrounding component values.
- A macromodel emulates the **nominal** performance of a **typical** device within **specified operating conditions** (for example, temperature, supply voltage). Thus the macromodel is often not as exhaustive as the datasheet, its purpose is to illustrate the main parameters of the product.

Data derived from macromodels used outside of the specified conditions (for example,  $V_{CC}$ , temperature) or even worse, outside of the device operating conditions (for example,  $V_{CC}$ ,  $V_{icm}$ ), are not reliable in any way.

[Section 4.2](#) provides the electrical characteristics resulting from the use of the RT512A, macromodel.

### 4.2 Electrical characteristics from macromodelization
