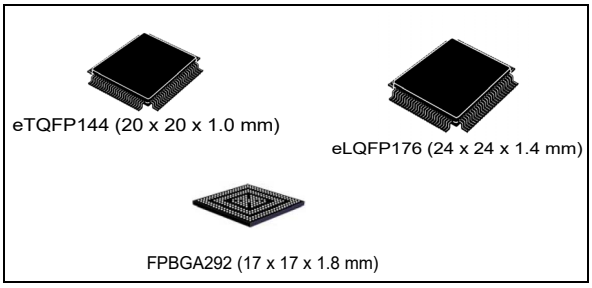
SPC584Gx, SPC58EGx, SPC58NGx

32-bit Power Architecture microcontroller for automotive ASIL-D applications

Datasheet - production data



Features

- AEC-Q100 qualified
- High performance e200z4 triple core:
  - 32-bit Power Architecture technology CPU
  - Core frequency as high as 180 MHz
  - Variable Length Encoding (VLE)
  - Floating Point, End-to-End Error Correction
- 6582 KB (6144 KB code flash+ 256 KB data flash) on-chip flash memory:
  - supports read during program and erase operations, and multiple blocks allowing EEPROM emulation
  - Supports read while read between the two code Flash partitions.
- 608 KB on-chip general-purpose SRAM (in addition to 160 KB core local data RAM): 64KB in CPU_0, 64 KB in CPU_1 and 32 KB in CPU_2
- 182 KB HSM dedicated flash memory (144 KB code + 32 KB data)
- Multi-channel direct memory access controller (eDMA)
  - one eDMA with 64 channels
  - one eDMA with 32 channels
- 1 interrupt controller (INTC)
- Comprehensive new generation ASIL-D safety concept:
  - ASIL-D of ISO 26262
  - One CPU channel in lockstep
  - Logic BIST
  - FCCU for collection and reaction to failure notifications
  - Memory BIST
  - Cyclic redundancy check (CRC) unit
  - Memory Error Management Unit (MEMU) for collection and reporting of error events in memories
- Crossbar switch architecture for concurrent access to peripherals, Flash, or RAM from multiple bus masters with end-to-end ECC
- Body cross triggering unit (BCTU)
  - Triggers ADC conversions from any eMIOS channel
  - Triggers ADC conversions from up to 2 dedicated PIT_RTIs
- Enhanced modular IO subsystem (eMIOS): up to 64 timed IO channels with 16-bit counter resolution
- Enhanced analog-to-digital converter system with:
  - 4 independent fast 12-bit SAR analog converters
  - One supervisor 12-bit SAR analog converter
  - One standby 10-bit SAR analog converter
- Communication interfaces:
  - 18 LINFlexD modules
  - 10 deserial serial peripheral interface (DSPI) modules
  - 8 MCAN interfaces with advanced shared memory scheme and ISO CAN-FD support
  - Dual-channel FlexRay controller
  - Two independent Ethernet controllers 10/100Mbps compliant IEEE 802.3-2008
- Low power capabilities
  - Versatile low power modes
  - Ultra low power standby with RTC
  - Smart Wake-up Unit for contact monitoring

  - Fast wakeup schemes
- Dual phase-locked loops with stable clock domain for peripherals and FM modulation domain for computational shell
- Nexus development interface (NDI) per IEEEISTO 5001-2003 standard, with some support for 2010 standard
- Boot assist Flash (BAF) supports factory programming using a serial bootload through the asynchronous CAN or LIN/UART
- Junction temperature range -40 °C to 150 °C

Table of contents

1 Introduction

This document describes the features of the family and options available within the family members, and highlights important electrical and physical characteristics of the device. To ensure a complete understanding of the device functionality, refer also to the device reference manual and errata sheet.

2 Description

The SPC584Gx, SPC58EGx, SPC58NGx microcontroller belongs to a family of devices superseding the SPC56x family. SPC584Gx, SPC58EGx, SPC58NGx build on the legacy of the SPC5x family, while introducing new features coupled with higher throughput to provide substantial reduction of cost per feature and significant power and performance improvement (MIPS per mW).

2.1 Device feature summary

Table 2 lists a summary of major features for the SPC584Gx, SPC58EGx, SPC58NGx device. The feature column represents a combination of module names and capabilities of certain modules. A detailed description of the functionality provided by each on-chip module is given later in this document.

2.3 Features

On-chip modules within SPC584Gx, SPC58EGx, SPC58NGx include the following features:

- Three main CPUs, dual issue, 32-bit CPU core complexes (e200z4), one paired in lock-step
  - Power architecture embedded specification compliance
  - Instruction set enhancement allowing variable length encoding (VLE), encoding a mix of 16-bit and 32-bit instructions, for code size footprint reduction
  - Single-precision floating point operations
  - Lightweight signal processing auxiliary processing unit (LSP APU) instruction support for digital signal processing (DSP) on Core_2
  - 16 KB local instruction RAM and 64 KB local data RAM for Core_0 and Core_1, 16 KB local instruction RAM and 32 KB local data RAM for Core_2
  - 8 KB I-Cache and 4 KB D-Cache for Core_0 and Core_1, 8kB I-Cache for Core_2
- 6400 KB (6144 KB code flash + 256 KB data flash) on-chip Flash memory
  - Supports read during program and erase operations, and multiple blocks allowing EEPROM emulation
  - Supports read while read between the two code Flash partitions
- 608 KB on-chip general-purpose SRAM (+ 160 KB data RAM included in the CPUs)
- 182 KB HSM dedicated flash memory (144 KB code + 32 KB data)
- Multi channel direct memory access controllers (eDMA paired in lock-step)
  - One eDMA with 64 channels
  - One eDMA with 32 channels
- One interrupt controller (INTC) in lock-step
- Dual phase-locked loops with stable clock domain for peripherals and FM modulation domain for computational shell
- Dual crossbar switch architecture for concurrent access to peripherals, Flash, or RAM from multiple bus masters with end-to-end ECC
- Hardware security module (HSM) to provide robust integrity checking of Flash memory
- System integration unit lite (SIUL)
- Boot assist Flash (BAF) supports factory programming using a serial bootload through the asynchronous CAN or LIN/UART
- Hardware support for motor control and safety related applications
- Enhanced modular IO subsystem (eMIOS): up to 64 (2 x 32) timed I/O channels with 16-bit counter resolution
  - Buffered updates
  - Support for shifted PWM outputs to minimize occurrence of concurrent edges
  - Supports configurable trigger outputs for ADC conversion for synchronization to channel output waveforms
  - Shared or independent time bases
  - DMA transfer support available

- Body cross triggering unit (BCTU)
  - Triggers ADC conversions from any eMIOS channel
  - Triggers ADC conversions from up to 2 dedicated PIT_RTIs
  - One event configuration register dedicated to each timer event allows to define the corresponding ADC channel
  - Synchronization with ADC to avoid collision
- Enhanced analog-to-digital converter system with:
  - Four independent fast 12-bit SAR analog converters
  - One supervisor 12-bit SAR analog converter
  - One 10-bit SAR analog converter with STDBY mode support
- Ten deserial serial peripheral interface (DSPI) modules
- Eighteen LIN and UART communication interface (LINFlexD) modules
  - LINFlexD_0 is a master/slave
  - All others are masters
- Eight modular controller area network (MCAN) modules, all supporting flexible data rate (CAN-FD)
- Dual-channel FlexRay controller
- Two ethernet controllers 10/100 Mbps, compliant IEEE 802.3-2008
  - IEEE 1588-2008 Time stamping (internal 64-bit time stamp)
  - IEEE 802.1AS and IEEE 802.1Qav (AVB-Feature)
  - IEEE 802.1Q VLAN tag detection
  - IPv4 and IPv6 checksum modules
- Nexus development interface (NDI) per IEEE-ISTO 5001-2003 standard, with some support for 2010 standard
- Device and board test support per Joint Test Action Group (JTAG) (IEEE 1149.1)
- Standby power domain with smart wake-up sequence

3 Package pinouts and signal descriptions

Refer to the SPC584Gx, SPC58EGx, SPC58NGx IO_ Definition document.

It includes the following sections:

1. Package pinouts
2. Pin descriptions
   a) Power supply and reference voltage pins
   b) System pins
   c) LVDS pins
   d) Generic pins

4 Electrical characteristics

4.1 Introduction

The present document contains the target Electrical Specification for the 40 nm family 32-bit MCU SPC584Gx, SPC58EGx, SPC58NGx products.

In the tables where the device logic provides signals with their respective timing characteristics, the symbol “CC” (Controller Characteristics) is included in the “Symbol” column.

In the tables where the external system must provide signals with their respective timing characteristics to the device, the symbol “SR” (System Requirement) is included in the “Symbol” column.

The electrical parameters shown in this document are guaranteed by various methods. To give the customer a better understanding, the classifications listed in *Table 3* are used and the parameters are tagged accordingly in the tables where appropriate.

Table 3. Parameter classifications

Classification tag	Tag description
P	Those parameters are guaranteed during production testing on each individual device.
C	Those parameters are achieved by the design characterization by measuring a statistically relevant sample size across process variations.
T	Those parameters are achieved by design validation on a small sample size from typical devices.
D	Those parameters are derived mainly from simulations.

4.2 Absolute maximum ratings

Table 4 describes the maximum ratings for the device. Absolute maximum ratings are stress ratings only, and functional operation at the maxima is not guaranteed. Exposure to absolute maximum rating conditions for extended periods may affect device reliability. Stress beyond the listed maxima, even momentarily, may affect device reliability or cause permanent damage to the device.

Table 4. Absolute maximum ratings

1. V_{DD_LV}: allowed 1.335 V - 1.400 V for 60 seconds cumulative time at the given temperature profile. Remaining time allowed 1.260 V - 1.335 V for 10 hours cumulative time at the given temperature profile. Remaining time as defined in *Section 4.3: Operating conditions*.
2. $V_{DD\_LV\_BD}$: allowed 1.450 V - 1.500 V for 60 seconds cumulative time at the given temperature profile. Remaining time allowed 1.375 V - 1.450 V for 10 hours cumulative time at maximum T_J = 125 °C. Remaining time as defined in *Section 4.3: Operating conditions*.
3. V_{DD_HV}: allowed 5.5 V – 6.0 V for 60 seconds cumulative time at the given temperature profile, for 10 hours cumulative time with the device in reset at the given temperature profile. Remaining time as defined in *Section 4.3: Operating conditions*.
4. The maximum input voltage on an I/O pin tracks with the associated I/O supply maximum. For the injection current condition on a pin, the voltage will be equal to the supply plus the voltage drop across the internal ESD diode from I/O pin to supply. The diode voltage varies greatly across process and temperature, but a value of 0.3 V can be used for nominal calculations.
5. Relative value can be exceeded if design measures are taken to ensure injection current limitation (parameter IINJ).

6. This limitation applies to pads with digital input buffer enabled. If the digital input buffer is disabled, there are no maximum limits to the transition time.
7. The limits for the sum of all normal and injected currents on all pads within the same supply segment can be found in *Section 4.8.3: I/O pad current specifications*.
8. 175°C are allowed for limited time. Mission profile with passive lifetime temperature >150°C have to be evaluated by ST to confirm that are granted by product qualification.
9. Solder profile per IPC/JEDEC J-STD-020D.
10. Moisture sensitivity per JDEC test method A112.

4.3 Operating conditions

Table 5 describes the operating conditions for the device, and for which all the specifications in the data sheet are valid, except where explicitly noted. The device operating conditions must not be exceeded or the functionality of the device is not guaranteed.

1. The ranges in this table are design targets and actual data may vary in the given range.
2. Maximum operating frequency is applicable to the cores and platform of the device. See the Clock Chapter in the Microcontroller Reference Manual for more information on the clock limitations for the various IP blocks on the device.
3. In order to evaluate the actual difference between ambient and junction temperatures in the application, refer to *Section 5.4: Package thermal characteristics*.
4. Core voltage as measured on device pin to guarantee published silicon performance.
5. In the range [1.14-1.08]V, the device functionality and specifications are granted and the device is expected to receive a flag by the internal LVD100 monitors to warn that the regulator (internal or external), providing the V_{DD_LV} supply, exited the expected operating conditions. If the internal LVD100 monitors are disabled by the application, then an external voltage monitor with minimum threshold of V_{DD_LV}(min) = 1.08 V measured at the device pad, has to be implemented. Refer to *Section 4.15.3: Voltage monitors* for the list of available internal monitors and to the Reference Manual for the configurability of the monitors.
6. Core voltage can exceed 1.26 V with the limitations provided in *Section 4.2: Absolute maximum ratings*, provided that HVD134_C monitor reset is disabled.
7. 1.260 V - 1.290 V range allowed periodically for supply with sinusoidal shape and average supply value below or equal to 1.236 V at the given temperature profile.
8. Full device lifetime. I/O and analog input specifications are only valid if the injection current on adjacent pins is within these limits. See *Section 4.2: Absolute maximum ratings* for maximum input current for reliability requirements.
9. The I/O pins on the device are clamped to the I/O supply rails for ESD protection. When the voltage of the input pins is above the supply rail, current will be injected through the clamp diode to the supply rails. For external RC network calculation, assume typical 0.3 V drop across the active diode. The diode voltage drop varies with temperature.
10. The limits for the sum of all normal and injected currents on all pads within the same supply segment can be found in *Section 4.8.3: I/O pad current specifications*.
11. Positive and negative Dynamic current injection pulses are allowed up to this limit. I/O and ADC specifications are not granted. See the dedicated chapters for the different specification limits. See the Absolute Maximum Ratings table for maximum input current for reliability requirements. Refer to the following pulses definitions: Pulse1 (ISO 7637-2:2011), Pulse 2a(ISO 7637-2:2011 5.6.2), Pulse 3a (ISO 7637-2:2011 5.6.3), Pulse 3b (ISO 7637-2:2011 5.6.3).

4.3.1 Power domains and power up/down sequencing

The following table shows the constraints and relationships for the different power domains. Supply1 (on rows) can exceed Supply2 (on columns), only if the cell at the given row and column is reporting 'ok'. This limitation is valid during power-up and power-down phases, as well as during normal device operation.

Table 7. Device supply relation during power-up/power-down sequence

		Supply2				
		V_{DD_LV}	**$V_{DD\_HV\_IO\_FLEX}$**	**$V_{DD\_HV\_IO\_MAIN}$ $V_{DD\_HV\_FLA}$ $V_{DD\_HV\_OSC}$**	**$V_{DD\_HV\_ADV}$**	**$V_{DD\_HV\_ADR}$**
Supply1	$V_{DD\_HV\_IO\_FLEX}$	ok		not allowed	ok	ok
	V_{DD_LV}(1)		ok	ok	ok	ok
	$V_{DD\_HV\_IO\_MAIN}$ $V_{DD\_HV\_FLA}$ $V_{DD\_HV\_OSC}$	ok	ok		ok	ok
	$V_{DD\_HV\_ADV}$	ok	ok	not allowed		ok
	$V_{DD\_HV\_ADR}$	ok	ok	not allowed	not allowed	

1. V_{DD_LV} can be higher than V_{DD_HV} supplies only during power-up/down transient ramps, in case of external LV regulator and if V_{DD_HV} supply voltage level is lower than V_{DD_LV} allowed max operating condition.

During power-up, all functional terminals are maintained in a known state as described in the device pinout Microsoft Excel file attached to the IO_Definition document.

4.4 Electrostatic discharge (ESD)

The following table describes the ESD ratings of the device:

- All ESD testing are in conformity with CDF-AEC-Q100 Stress Test Qualification for Automotive Grade Integrated Circuits,
- Device failure is defined as: “If after exposure to ESD pulses, the device does not meet the device specification requirements, which include the complete DC parametric and functional testing at room temperature and hot temperature, maximum DC parametric variation within 10% of maximum specification”.

Table 8. ESD ratings

Parameter	C	Conditions	Value	Unit
ESD for Human Body Model (HBM)(1)	T	All pins	2000	V
ESD for field induced Charged Device Model (CDM)(2)	T	All pins	500	V
	T	Corner Pins	750	V

1. This parameter tested in conformity with ANSI/ESD STM5.1-2007 Electrostatic Discharge Sensitivity Testing.
2. This parameter tested in conformity with ANSI/ESD STM5.3-1990 Charged Device Model - Component Level.

4.5 Electromagnetic compatibility characteristics

EMC measurements at IC-level IEC standards are available from STMicroelectronics on request.

4.6 Temperature profile

The device is qualified in accordance to AEC-Q100 Grade1 requirements, such as HTOL 1,000 h and HTDR 1,000 hrs, T_J = 150 °C.

4.7 Device consumption

1. The ranges in this table are design targets and actual data may vary in the given range.
2. The leakage considered is the sum of core logic and RAM memories. The contribution of analog modules is not considered, and they are computed in the dynamic I_{DD_LV} and I_{DD_HV} parameters.
3. I_{DD_LKG} (leakage current) and I_{DD_LV} (dynamic current) are reported as separate parameters, to give an indication of the consumption contributors. The tests used in validation, characterization and production are verifying that the total consumption (leakage+dynamic) is lower or equal to the sum of the maximum values provided (I_{DD_LKG} + I_{DD_LV}). The two parameters, measured separately, may exceed the maximum reported for each, depending on the operative conditions and the software profile used.

4. Use case: 3 x e200Z4 @180 MHz with all locksteps on (main core + dma + irq), HSM @90 MHz, all IPs clock enabled, Flash access with prefetch disabled, Flash consumption includes parallel read and program/erase, 1xSARADC in continuous conversion, DMA continuously triggered by ADC conversion, 5xDSPI / 7xCAN / 12xLINFlex / FlexRay, 1xEMIOS running (5 channels in OPWMT mode), FIRC, SIRC, FXOSC, PLL0-1 running. The switching activity estimated for dynamic consumption does not include I/O toggling, which is highly dependent on the application. Details of the software configuration are available separately. The total device consumption is I_{DD_LV} + I_{DD_HV} + I_{DD_LKG} for the selected temperature.
5. Gateway use case: Two cores running at 160 MHz, no lockstep, DMA, PLL, FLASH read only 25%, 8xCAN, 1xEthernet, HSM, 4xSARADC.
6. BCM use case: One Core running at 160 MHz, no lockstep, DMA, PLL, FLASH read only 25%, 2xCAN, HSM, 5xSARADC.
7. Dynamic consumption of one core, including the dedicated I/D-caches and I/D-MEMS contribution.
8. Dynamic consumption of the HSM module, including the dedicated memories, during the execution of Electronic Code Book crypto algorithm on 1 block of 16 byte of shared RAM.
9. Flash in Low Power. Sysclk at 160 MHz, PLL0_PHI at 160 MHz, XTAL at 40 MHz, FIRC 16 MHz ON, RCOSC1M off. MCAN: instances: 0, 1, 2, 3, 4, 5, 6, 7 ON (configured but no reception or transmission), Ethernet ON (configured but no reception or transmission), ADC ON (continuously converting). All others IPs clock-gated.
10. Sysclk = RC16 MHz, RC16 MHz ON, RC1 MHz ON, PLL OFF. All possible peripherals off and clock gated. Flash in power down mode.
11. STANDBY mode: device configured for minimum consumption, RC16 MHz off, RC1 MHz on.
12. SSWU1 mode adder: FIRC = ON, SSWU clocked at 8 MHz and running over all STANDBY period, ADC off. The total standby consumption can be obtained by adding this parameter to the IDDSTBY parameter for the selected memory size and temperature.
13. SSWU2 mode adder: FIRC = ON, SSWU clocked at 8 MHz and running over all STANDBY period, ADC on in continuous conversion. The total standby consumption can be obtained by adding this parameter to the I_{DDSTBY} parameter for the selected memory size and temperature.
14. Worst case usage (data trace, data overlay, full Aurora utilization). If Aurora and JTAGM/LFAST not used, $V_{DD\_LV\_BD}$ current is reduced by ~20mA.

4.8 I/O pad specification

The following table describes the different pad type configurations.

Table 10. I/O pad specification descriptions

Pad type	Description
Weak configuration	Provides a good compromise between transition time and low electromagnetic emission.
Medium configuration	Provides transition fast enough for the serial communication channels with controlled current to reduce electromagnetic emission.
Strong configuration	Provides fast transition speed; used for fast interface.
Very strong configuration	Provides maximum speed and controlled symmetric behavior for rise and fall transition. Used for fast interface including Ethernet and FlexRay interfaces requiring fine control of rising/falling edge jitter.
Differential configuration	A few pads provide differential capability providing very fast interface together with good EMC performances.
Input only pads	These low input leakage pads are associated with the ADC channels.
Standby pads	Some pads are active during Standby. Low Power Pads input buffer can only be configured in TTL mode. When the pads are in Standby mode, the Pad-Keeper feature is activated: if the pad status is high, the weak pull-up resistor is automatically enabled; if the pad status is low, the weak pull-down resistor is automatically enabled.

Note: Each I/O pin on the device supports specific drive configurations. See the signal description table in the device reference manual for the available drive configurations for each I/O pin. PMC_DIG_VSIO register has to be configured to select the voltage level (3.3 V or 5.0 V) for each IO segment.

Logic level is configurable in running mode while it is TTL not-configurable in STANDBY for LP (low power) pads, so if a LP pad is used to wakeup from STANDBY, it should be configured as TTL also in running mode in order to prevent device wrong behavior in STANDBY.

4.8.1 I/O input DC characteristics

The following table provides input DC electrical characteristics, as described in *Figure 3*.

I_{WPD}	CC	T	Weak pull-down current absolute value	V_{IN} = 0.69 * $V_{DD\_HV\_IO}$(1)	—	—	130	µA
		P		V_{IN} = 0.9 V(2)	15	—	—	
R_{WPD}	CC	D	Weak Pull-down resistance	$V_{DD\_HV\_IO}$ = 5.0 V ± 10%	29	—	60	KΩ
R_{WPD}	CC	D	Weak Pull-down resistance	$V_{DD\_HV\_IO}$ = 3.3 V ± 10%	19	—	60	KΩ

1. Maximum current when forcing a change in the pin level opposite to the pull configuration.
2. Minimum current when keeping the same pin level state than the pull configuration.

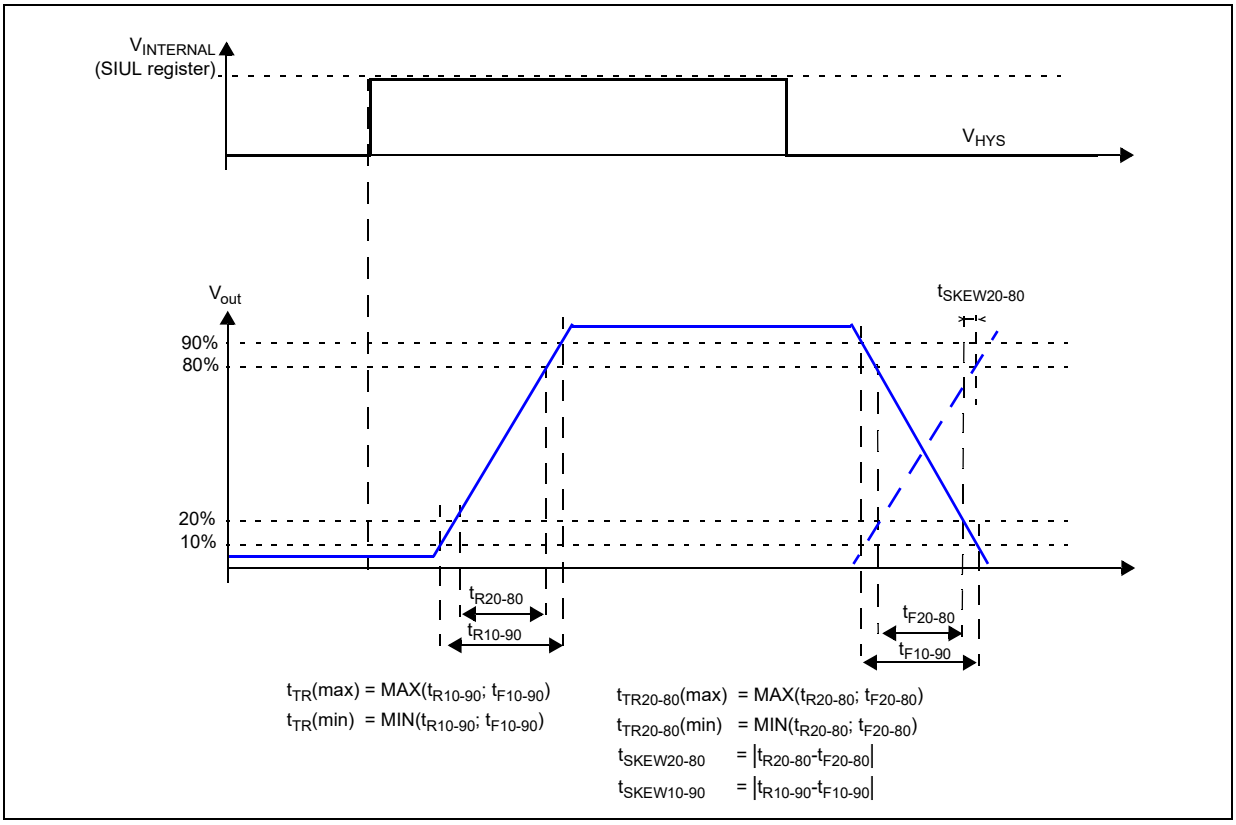
Note: When the device enters into standby mode, the LP pads have the input buffer switched-on. As a consequence, if the pad input voltage VIN is $V_{SS}<V_{IN}<V_{DD\_HV}$, an additional consumption can be measured in the VDD_HV domain. The highest consumption can be

seen around mid-range (VIN ~=VDD_HV/2), 2-3mA depending on process, voltage and temperature.
This situation may occur if the PAD is used as a ADC input channel, and $V_{SS}<V_{IN}<V_{DD\_HV}$. The applications should ensure that LP pads are always set to VDD_HV or VSS, to avoid the extra consumption. Please refer to the device pinout IO definition excel file to identify the low-power pads which also have an ADC function.

4.8.2 I/O output DC characteristics

Figure 4 provides description of output DC electrical characteristics.

Figure 4. I/O output DC electrical characteristics definition



The following tables provide DC characteristics for bidirectional pads:

4.8.3 I/O pad current specifications

The I/O pads are distributed across the I/O supply segment. Each I/O supply segment is associated to a V_{DD}/V_{SS} supply pair as described in the device pinout Microsoft Excel file attached to the IO_Definition document.

Table 17 provides I/O consumption figures.

In order to ensure device reliability, the average current of the I/O on a single segment should remain below the I_{RMSSEG} maximum value.

In order to ensure device functionality, the sum of the dynamic and static current of the I/O on a single segment should remain below the I_{DYNSEG} maximum value.

Pad mapping on each segment can be optimized using the pad usage information provided on the I/O Signal Description table.

				C_L = 50 pF, V_{DD} = 3.3 V ± 10%	—	—	55	

1. I/O current consumption specifications for the 4.5 V $\leq V_{DD\_HV\_IO} \leq$ 5.5 V range are valid for VSIO_[VSIO_xx] = 1, and VSIO[VSIO_xx] = 0 for 3.0 V $\leq V_{DD\_HV\_IO} \leq$ 3.6 V.
2. Average consumption in one pad toggling cycle.
3. Stated maximum values represent peak consumption that lasts only a few ns during I/O transition. When possible (timed output) it is recommended to delay transition between pads by few cycles to reduce noise and consumption.

4.9 Reset pad (PORST, ESR0) electrical characteristics

The device implements dedicated bidirectional reset pins as below specified. $\overline{\text{PORST}}$ pin does not require active control. It is possible to implement an external pull-up to ensure correct reset exit sequence. Recommended value is 4.7 KΩ.

Figure 5. Startup Reset requirements

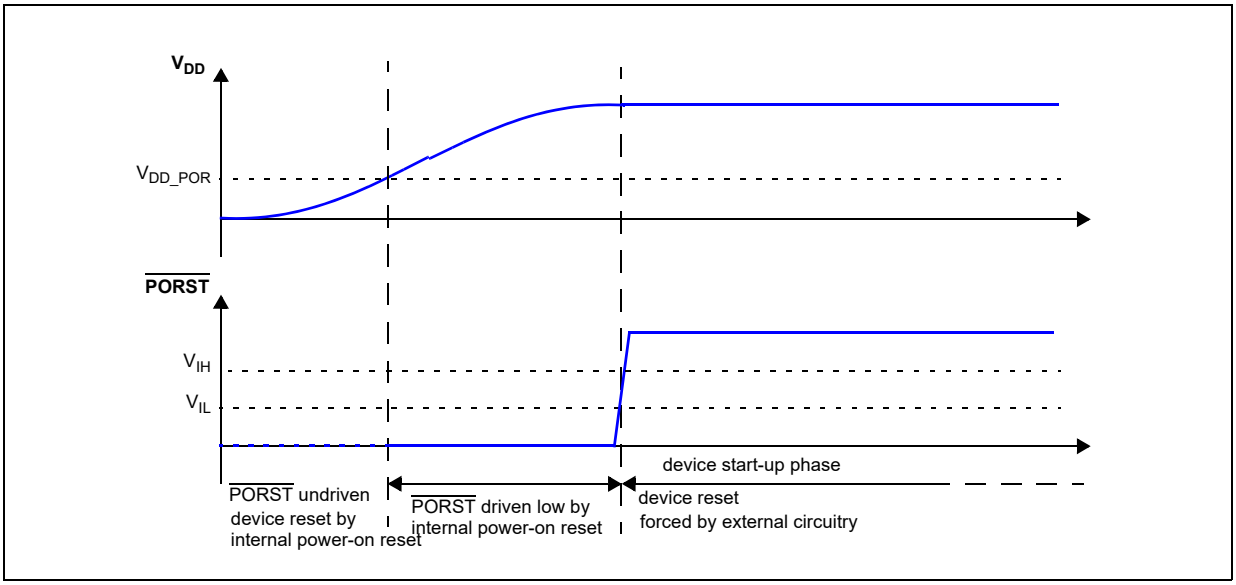

Figure 6 describes device behavior depending on supply signal on PORST:

1. $\overline{\text{PORST}}$ low pulse has too low amplitude: it is filtered by input buffer hysteresis. Device remains in current state.
2. $\overline{\text{PORST}}$ low pulse has too short duration: it is filtered by low pass filter. Device remains in current state.
3. $\overline{\text{PORST}}$ low pulse is generating a reset:
   a) $\overline{\text{PORST}}$ low but initially filtered during at least WFRST. Device remains initially in current state.
   b) $\overline{\text{PORST}}$ potentially filtered until WNFRST. Device state is unknown. It may either be reset or remains in current state depending on extra condition (temperature, voltage, device).
   c) $\overline{\text{PORST}}$ asserted for longer than WNFRST. Device is under reset.

1. I_{ol_r} applies to PORST: Strong Pull-down is active on PHASE0 for PORST. A dedicated Reset Pad for ESR0, with the specifications reported in this table, is implemented. Refer to the device pinout IO definition excel file for details regarding pin usage.
2. Maximum current when forcing a change in the pin level opposite to the pull configuration.
3. Minimum current when keeping the same pin level state than the pull configuration.

4.10 PLLs

Two phase-locked loop (PLL) modules are implemented to generate system and auxiliary clocks on the device.

Figure 7 depicts the integration of the two PLLs. Please, refer to device Reference Manual for more detailed schematic.

1. The range is selectable by UTEST miscellaneous DCF client XOSC_FREQ_SEL.
2. The XTAL frequency, if used to feed the PPL0 (or PLL1), shall obey the minimum input frequency limit set for PLL0 (or PLL1).
3. This value is determined by the crystal manufacturer and board design, and it can potentially be higher than the maximum provided.
4. Proper PC board layout procedures must be followed to achieve specifications.
5. Crystal recovery time is the time for the oscillator to settle to the correct frequency after adjustment of the integrated load capacitor value.
6. Applies to an external clock input and not to crystal mode.
7. See crystal manufacturer's specification for recommended load capacitor (C_L) values.The external oscillator requires external load capacitors when operating from 8 MHz to 16 MHz. Account for on-chip stray capacitance (C_{S_EXTAL}/C_{S_XTAL}) and PCB capacitance when selecting a load capacitor value. When operating at 20 MHz/40 MHz, the integrated load capacitor value is selected via S/W to match the crystal manufacturer's specification, while accounting for on-chip and PCB capacitance.
8. Amplitude on the EXTAL pin after startup is determined by the ALC block, that is the Automatic Level Control Circuit. The function of the ALC is to provide high drive current during oscillator startup, but reduce current after oscillation in order to reduce power, distortion, and RFI, and to avoid over driving the crystal. The operating point of the ALC is dependent on the crystal value and loading conditions.
9. I_{XTAL} is the oscillator bias current out of the XTAL pin with both EXTAL and XTAL pins grounded. This is the maximum current during startup of the oscillator.

C_{EXT}	SR	—	External capacitance at the pad input pin	To preserve the accuracy of the ADC, it is necessary that analog input pins have low AC impedance. Placing a capacitor with good high frequency characteristics at the input pin of the device can be effective: the capacitor should be as large as possible. This capacitor contributes to attenuating the noise present on the input pin. The impedance relative to the signal source can limit the ADC's sample rate.			

1. It enables discharge of up to 100 nF from 5 V every 300 ms. Refer to the device pinout Microsoft Excel file attached to the IO_Definition document for the pads supporting it.

4.12.2 SAR ADC 12 bit electrical specification

The SARn ADCs are 12-bit Successive Approximation Register analog-to-digital converters with full capacitive DAC. The SARn architecture allows input channel multiplexing.

Note: The functional operating conditions are given in the DC electrical specifications. Absolute maximum ratings are stress ratings only, and functional operation at the maxima is not guaranteed. Stress beyond the listed maximum may affect device reliability or cause permanent damage to the device.

1. Minimum ADC sample times are dependent on adequate charge transfer from the external driving circuit to the internal sample capacitor. The time constant of the entire circuit must allow the sampling capacitor to charge within 1/2 LSB within the sampling window. Refer to Figure 8 for models of the internal ADC circuit, and the values to use in external RC sizing and calculating the sampling window duration.
2. Mode1: 6 sampling cycles + 10 conversion cycles at 13.33 MHz.
3. Mode2: 5 sampling cycles + 10 conversion cycles at 13.33 MHz.
4. Mode3: 6 sampling cycles + 10 conversion cycles at 16 MHz.
5. $I_{ADCREFH}$ and $I_{ADCREFL}$ are independent from ADC clock frequency. It depends on conversion rate: consumption is driven by the transfer of charge between internal capacitances during the conversion.
6. Current parameter values are for a single ADC.

7. TUE is granted with injection current within the range defined in Table 26, for parameters classified as T and D.
8. DNL is granted with injection current within the range defined in Table 26, for parameters classified as T and D.

4.12.3 SAR ADC 10 bit electrical specification

The ADC comparators are 10-bit Successive Approximation Register analog-to-digital converters with full capacitive DAC. The SARn architecture allows input channel multiplexing.

Note: The functional operating conditions are given in the DC electrical specifications. Absolute maximum ratings are stress ratings only, and functional operation at the maxima is not guaranteed. Stress beyond the listed maximum may affect device reliability or cause permanent damage to the device.

I_{LVDS_RX}	CC	C	Receiver DC current consumption	Enabled	—	—	1.6	mA
I_{PIN_RX}	CC	D	Maximum consumption on receiver input pin	Δ_{VI} = 400 mV, R_{IN} = 80 Ω	—	—	5	mA

1. The LVDS pad startup and receiver electrical characteristics in this table apply to both the LFAST & High-speed Debug (HSD) LVDS pad.
2. All LVDS pad electrical characteristics are valid from -40 °C to 150 °C.
3. All startup times are defined after a 2 peripheral bridge clock delay from writing to the corresponding enable bit in the LVDS control registers (LCR) of the LFAST and High-speed Debug modules. The value of the LCR bits for the LFAST/HSD modules don't take effect until the corresponding SIUL2 MSCR ODC bits are set to LFAST LVDS mode. Startup times for MSC/DSPI LVDS are defined after 2 peripheral bridge clock delay after selecting MSC/DSPI LVDS in the corresponding SIUL2 MSCR ODC field.
4. Startup times are valid for the maximum external loads CL defined in both the LFAST/HSD and MSC/DSPI transmitter electrical characteristic tables.
5. Bias startup time is defined as the time taken by the current reference block to reach the settling bias current after being enabled.
6. Total transmitter startup time from power down to normal mode is t_{STRT_BIAS} + t_{PD2NM_TX} + 2 peripheral bridge clock periods.
7. Total transmitter startup time from sleep mode to normal mode is t_{SM2NM_TX} + 2 peripheral bridge clock periods. Bias block remains enabled in sleep mode.

8. Total receiver startup time from power down to normal mode is t_{STRT_BIAS} + t_{PD2NM_RX} + 2 peripheral bridge clock periods.
9. Total receiver startup time from power down to sleep mode is t_{PD2SM_RX} + 2 peripheral bridge clock periods. Bias block remains enabled in sleep mode.
10. Absolute min = 0.15 V – (285 mV/2) = 0 V
11. Absolute max = 1.6 V + (285 mV/2) = 1.743 V
12. Value valid for LFAST mode. The LXRXOP[0] bit in the LFAST LVDS Control Register (LCR) must be set to one to ensure proper LFAST receive timing.
13. Total internal capacitance including receiver and termination, co-bonded GPIO pads, and package contributions.

I_{PIN_TX}	CC	D	Transmitter DC current sourced through output pin	—	1.1		2.85	mA

1. This table is applicable to LFAST LVDS pads used in LFAST configuration (SIUL2_MSCR_IO_n.ODC=101).
2. The LFAST and High-Speed Debug LFAST pad electrical characteristics are based on worst case internal capacitance values shown in *Figure 12*.
3. All LFAST and High-Speed Debug LVDS pad electrical characteristics are valid from -40 °C to 150 °C.
4. Valid for maximum data rate f_{DATA}. Value given is the capacitance on each terminal of the differential pair, as shown in *Figure 12*.
5. Valid for maximum external load C_L.

ΔPER_{EYE}	CC	T	Output Eye Jitter (peak to peak)(5)	—	—	—	400	ps

1. The specifications in this table apply to both the interprocessor bus and debug LFAST interfaces.
2. If the input frequency is lower than 20 MHz, it is required to set a input division factor of 1.
3. The 320 MHz frequency is achieved with a 20 MHz reference clock.
4. The total lock time is the sum of the coarse lock time plus the programmable lock delay time 2 clock cycles of the peripheral bridge clock that is connected to the PLL on the device (to set the PLL enable bit).
5. Measured at the transmitter output across a 100 Ω termination resistor on a device evaluation board. See *Figure 12*.

4.15 Power management

The power management module monitors the different power supplies as well as it generates the required internal supplies. The device can operate in the following configurations:

Table 33. Power management regulators

Device	External regulator	Internal SMPS regulator	Internal linear regulator external ballast	Internal linear regulator internal ballast	Auxiliary regulator	Clamp regulator	Internal standby regulator(1)
SPC584Gx SPC58EGx SPC58NGx	—	—	X	—	X	X	X(2)

1. Standby regulator is automatically activated when the device enters standby mode. Standby mode is not supported if the device operates in External regulator mode. Emulation Device calibration and trace features are not supported in standby mode.
2. Emulation Device calibration and trace features are not supported in standby mode.

4.15.1 Power management integration

Use the integration schemes provided below to ensure the proper device function, according to the selected regulator configuration.

The internal regulators are supplied by $V_{DD\_HV\_IO\_MAIN}$ supply and are used to generate V_{DD_LV} supply.

Place capacitances on the board as near as possible to the associated pins and limit the serial inductance of the board to less than 5 nH.

It is recommended to use the internal regulators only to supply the device itself.

1. V_{DD} = 3.3 V ± 10% / 5.0 V ± 10%, T_J = –40 / 150 °C, unless otherwise specified.
2. Recommended X7R or X5R ceramic –50% / +35% variation across process, temperature, voltage and after aging.
3. CE capacitance is required both in internal and external regulator mode.
4. For noise filtering, add a high frequency bypass capacitance of 10 nF.
5. For applications it is recommended to implement at least 5 C_{LV} capacitances.
6. Recommended X7R capacitors. For noise filtering, add a high frequency bypass capacitance of 100 nF.
7. CB capacitance is required if only the external ballast is implemented.

1. Even if LVD/HVD monitor reaction is configurable, the application ensures that the device remains in the operative condition range, and the internal LVDx monitors are disabled by the application. Then an external voltage monitor with minimum threshold of VDD_LV(min) = 1.08 V measured at the device pad, has to be implemented.
For HVDx, if the application disables them, then they need to grant that VDD_LV and VDD_HV voltage levels stay withing the limitations provided in *Section 4.2: Absolute maximum ratings*.
2. The values reported are Trimmed values, where applicable.
3. See Figure 15. Transitions shorter than minimum are filtered. Transitions longer than maximum are not filtered, and will be delayed by $T_{VMFILTER}$ time. Transitions between minimum and maximum can be filtered or not filtered, according to temperature, process and voltage variations.

1. Characteristics are valid both for Data Flash and Code Flash, unless specified in the characteristics column.
2. Actual hardware operation times; this does not include software overhead.
3. Typical program and erase times assume nominal supply values and operation at 25 °C.
4. Typical End of Life program and erase times represent the median performance and assume nominal supply values. Typical End of Life program and erase values may be used for throughput calculations. These values are characteristic, but not tested.
5. Lifetime maximum program & erase times apply across the voltages and temperatures and occur after the specified number of program/erase cycles. These maximum values are characterized but not tested or guaranteed.
6. Initial factory condition: < 100 program/erase cycles, 25 °C typical junction temperature and nominal (± 5%) supply voltages.
7. Initial maximum “All temp” program and erase times provide guidance for time-out limits used in the factory and apply for less than or equal to 100 program or erase cycles, –40 °C < TJ < 150 °C junction temperature and nominal (± 5%) supply voltages.

8. Rate computed based on 256 KB sectors.
9. Only code sectors, not including EEPROM.
10. Time between suspend resume and next suspend. Value stated actually represents Min value specification.
11. Timings guaranteed by design.
12. AIC is done using system clock, thus all timing is dependent on system frequency and number of wait states. Timing in the table is calculated at max frequency.

All the Flash operations require the presence of the system clock for internal synchronization. About 50 synchronization cycles are needed: this means that the timings of the previous table can be longer if a low frequency system clock is used.

1. Program and erase cycles supported across specified temperature specifications.
2. It is recommended that the application enables the core cache memory.
3. 10K cycles on 4-256 KB blocks is not intended for production. Reduced reliability and degraded erase time are possible.

4.17 AC Specifications

All AC timing specifications are valid up to 150 °C, except where explicitly noted.

1. These specifications apply to JTAG boundary scan only. See Table 44 for functional specifications.
2. JTAG timing specified at $V_{DD\_HV\_IO\_JTAG}$ = 4.0 to 5.5 V and max. loading per pad type as specified in the I/O section of the datasheet.
3. Timing includes TCK pad delay, clock tree delay, logic delay and TDO output pad delay.
4. Applies to all pins, limited by pad slew rate. Refer to IO delay and transition specification and add 20 ns for JTAG delay.

16	—	CC	D	TDO hold time with respect to TCK falling edge (minimum TDO propagation delay)	2.25	—	ns

1. Nexus timing specified at $V_{DD\_HV\_IO\_JTAG}$ = 3.0 V to 5.5 V, and maximum loading per pad type as specified in the I/O section of the data sheet.
2. t_{CYC} is system clock period.
3. Achieving the absolute minimum TCK cycle time may require a maximum clock speed (system frequency / 8) that is less than the maximum functional capability of the design (system frequency / 4) depending on the actual peripheral frequency being used. To ensure proper operation TCK frequency should be set to the peripheral frequency divided by a number greater than or equal to that specified here.
4. This is a functionally allowable feature. However, it may be limited by the maximum frequency specified by the Absolute minimum TCK period specification.
5. This value is TDO propagation time 36 ns + 4 ns setup time to sampling edge.
6. This may require a maximum clock speed (system frequency / 8) that is less than the maximum functional capability of the design (system frequency / 4) depending on the actual system frequency being used.
7. This value is TDO propagation time 16 ns + 4 ns setup time to sampling edge.
8. Timing includes TCK pad delay, clock tree delay, logic delay and TDO output pad delay.

4.17.2 DSPI timing with CMOS pads

DSPI channel frequency support is shown in *Table 46*.

Timing specifications are shown in the tables below.

Table 46. DSPI channel frequency support

DSPI use mode[1]			Max usable frequency (MHz)[2],[3]

1. Each DSPI module can be configured to use different pins for the interface. Refer to the device pinout Microsoft Excel file attached to the IO_Definition document for the available combinations. It is not possible to reach the maximum performance with every possible combination of pins.
2. Maximum usable frequency can be achieved if used with fastest configuration of the highest drive pads.
3. Maximum usable frequency does not take into account external device propagation delay.

1. All timing values for output signals in this table are measured to 50% of the output voltage.
2. Timing is guaranteed to same drive capabilities for all signals, mixing of pad drives may reduce operating speeds and may cause incorrect operation.
3. N is the number of clock cycles added to time between PCS assertion and SCK assertion and is software programmable using DSPI_CTARx[PSSCK] and DSPI_CTARx[CSSCK]. The minimum value is 2 cycles unless TSB mode or Continuous SCK clock mode is selected, in which case, N is automatically set to 0 clock cycles (PCS and SCK are driven by the same edge of DSPI_CLKn).
4. t_{SYS} is the period of DSPI_CLKn clock, the input clock to the DSPI module. Maximum frequency is 100 MHz (min t_{SYS} = 10 ns).
5. M is the number of clock cycles added to time between SCK negation and PCS negation and is software programmable using DSPI_CTARx[PASC] and DSPI_CTARx[ASC]. The minimum value is 2 cycles unless TSB mode or Continuous SCK clock mode is selected, in which case, M is automatically set to 0 clock cycles (PCS and SCK are driven by the same edge of DSPI_CLKn).
6. t_{SDC} is only valid for even divide ratios. For odd divide ratios the fundamental duty cycle is not 50:50. For these odd divide ratios cases, the absolute spec number is applied as jitter/uncertainty to the nominal high time and low time.
7. PCSx and PCSS using same pad configuration.
8. Input timing assumes an input slew rate of 1 ns (10% – 90%) and uses TTL voltage thresholds.
9. SOUT Data Valid and Data hold are independent of load capacitance if SCK and SOUT load capacitances are the same value.

1. All timing values for output signals in this table are measured to 50% of the output voltage.
2. Timing is guaranteed to same drive capabilities for all signals, mixing of pad drives may reduce operating speeds and may cause incorrect operation.
3. N is the number of clock cycles added to time between PCS assertion and SCK assertion and is software programmable using DSPI_CTARx[PSSCK] and DSPI_CTARx[CSSCK]. The minimum value is 2 cycles unless TSB mode or Continuous SCK clock mode is selected, in which case, N is automatically set to 0 clock cycles (PCS and SCK are driven by the same edge of DSPI_CLKn).

4.17.3 Ethernet timing

The Ethernet provides both MII and RMII interfaces. The MII and RMII signals can be configured for either CMOS or TTL signal levels compatible with devices operating at either 5.0 V or 3.3 V. Please check the device pinout details to review the packages supporting MII and RMII.

4.17.3.1 MII receive signal timing (RXD[3:0], RX_DV, RX_ER, and RX_CLK)

The receiver functions correctly up to a RX_CLK maximum frequency of 25 MHz +1%. There is no minimum frequency requirement. The system clock frequency must be at least equal to or greater than the RX_CLK frequency.

Note: In the following table, all timing specifications are referenced from RX_CLK = 1.4 V to the valid input levels, 0.8 V and 2.0 V.

Table 50. MII receive signal timing

Symbol		C	Characteristic	Value		Unit
				Min	Max	
M1	CC	D	RXD[3:0], RX_DV, RX_ER to RX_CLK setup	5	—	ns

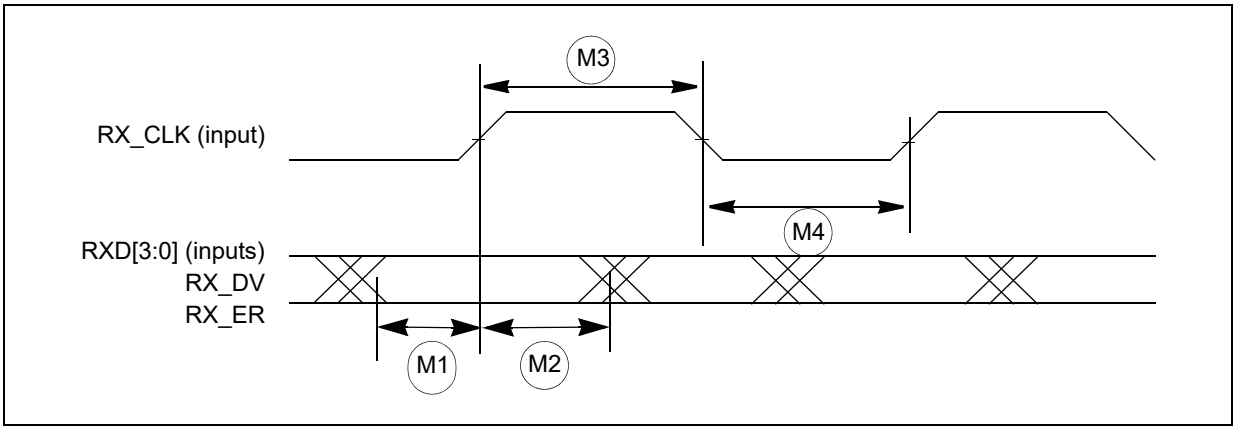
M4	CC	D	RX_CLK pulse width low	35%	65%	RX_CLK period

Figure 33. MII receive signal timing diagram



4.17.3.2 MII transmit signal timing (TXD[3:0], TX_EN, TX_ER, TX_CLK)

The transmitter functions correctly up to a TX_CLK maximum frequency of 25 MHz +1%. There is no minimum frequency requirement. The system clock frequency must be at least equal to or greater than the TX_CLK frequency.

The transmit outputs (TXD[3:0], TX_EN, TX_ER) can be programmed to transition from either the rising or falling edge of TX_CLK, and the timing is the same in either case. This option allows the use of non-compliant MII PHYs.

Refer to the SPC584Gx, SPC58EGx, SPC58NGx 32-bit Power Architecture microcontroller *reference manual's* Ethernet chapter for details of this option and how to enable it.

Note: In the following table, all timing specifications are referenced from TX_CLK = 1.4 V to the valid output levels, 0.8 V and 2.0 V.

Table 51. MII transmit signal timing

Symbol		C	Characteristic	Value(1)		Unit

M7	CC	D	TX_CLK pulse width high	35%	65%	TX_CLK period
M8	CC	D	TX_CLK pulse width low	35%	65%	TX_CLK period

1. Output parameters are valid for C_L = 25 pF, where C_L is the external load to the device. The internal package capacitance is accounted for, and does not need to be subtracted from the 25 pF value

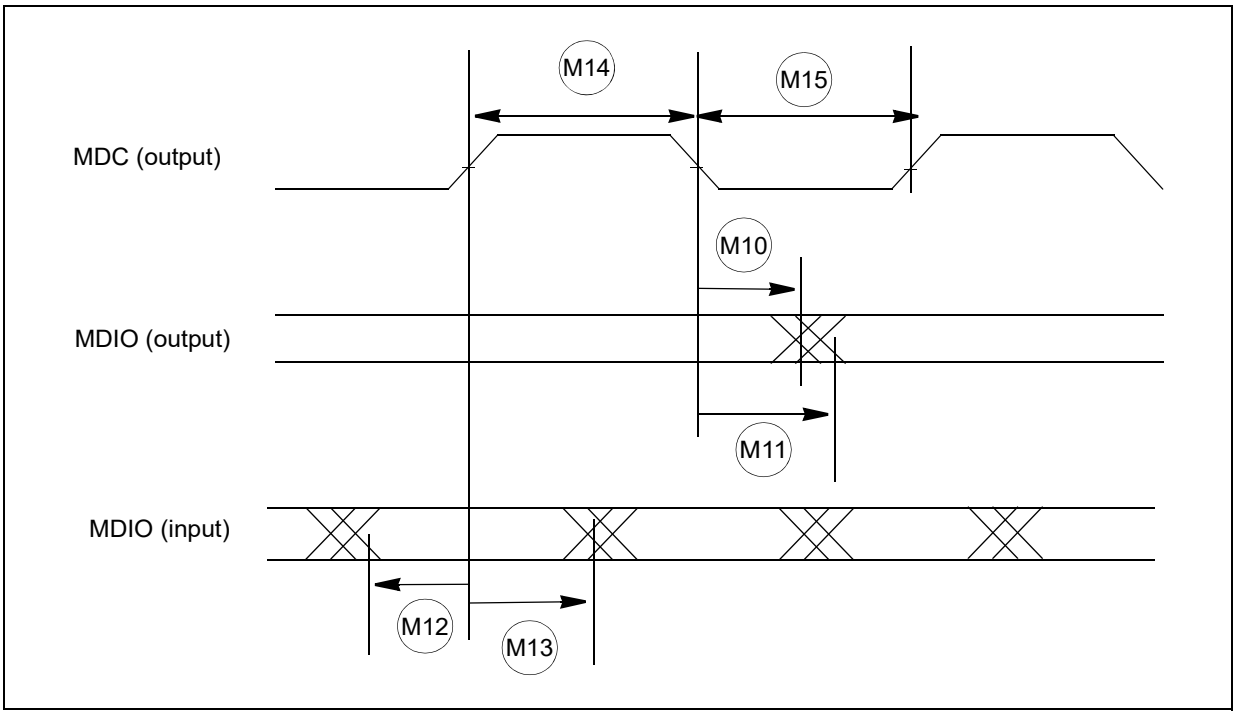
4.17.3.4 MII and RMII serial management channel timing (MDIO and MDC)

The Ethernet functions correctly with a maximum MDC frequency of 2.5 MHz.

Figure 36. MII serial management channel timing diagram



4.17.3.5 MII and RMII serial management channel timing (MDIO and MDC)

The Ethernet functions correctly with a maximum MDC frequency of 2.5 MHz.

Note: In the following table, all timing specifications are referenced from MDC = 1.4 V (TTL levels) to the valid input and output levels, 0.8 V and 2.0 V (TTL levels). For 5 V operation, timing is referenced from MDC = 50% to 2.2 V/3.5 V input and output levels.

4.17.3.6 RMII receive signal timing (RXD[1:0], CRS_DV)

The receiver functions correctly up to a REF_CLK maximum frequency of 50 MHz +1%. There is no minimum frequency requirement. The system clock frequency must be at least equal to or greater than the RX_CLK frequency, which is half that of the REF_CLK frequency.

Note: In the following table, all timing specifications are referenced from REF_CLK = 1.4 V to the valid input levels, 0.8 V and 2.0 V.

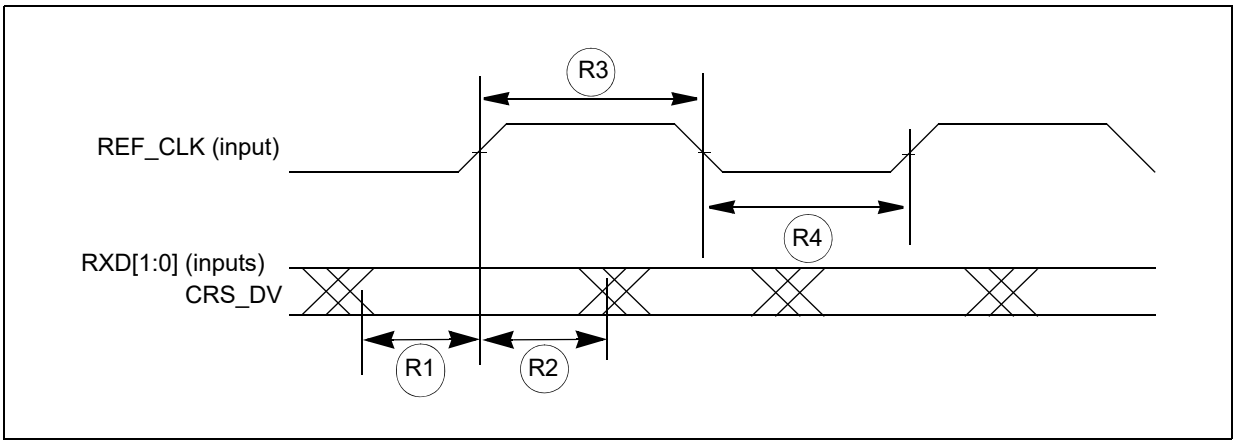
Figure 38. RMII receive signal timing diagram



4.17.3.7 RMII transmit signal timing (TXD[1:0], TX_EN)

The transmitter functions correctly up to a REF_CLK maximum frequency of 50 MHz + 1%. There is no minimum frequency requirement. The system clock frequency must be at least equal to or greater than the TX_CLK frequency, which is half that of the REF_CLK frequency.

The transmit outputs (TXD[1:0], TX_EN) can be programmed to transition from either the rising or falling edge of REF_CLK, and the timing is the same in either case. This option allows the use of non-compliant RMII PHYs.

Note: In the following table, all timing specifications are referenced from REF_CLK = 1.4 V to the valid output levels, 0.8 V and 2.0 V.

RMII transmit signal valid timing specified is considering the rise/fall time of the ref_clk on the pad as 1ns.

4.17.7 I2C timing

The I^2C AC timing specifications are provided in the following tables.

Note: In the following table, I2C input timing is valid for Automotive and TTL inputs levels, hysteresis enabled, and an input edge rate no slower than 1 ns (10% – 90%).

Table 62. I2C input timing specifications – SCL and SDA

No.	Symbol		C	Parameter	Value		Unit
					Min	Max

7	—	CC	D	Start condition setup time (for repeated start condition only)	2	—	PER_CLK Cycle
8	—	CC	D	Stop condition setup time	2	—	PER_CLK Cycle

1. PER_CLK is the SoC peripheral clock, which drives the I^2C BIU and module clock inputs. See the Clocking chapter in the device reference manual for more detail.

Note: In the following table:

- *All output timing is worst case and includes the mismatching of rise and fall times of the output pads.*

- *Output parameters are valid for CL = 25 pF, where CL is the external load to the device (lumped). The internal package capacitance is accounted for, and does not need to be subtracted from the 25 pF value.*
- *Timing is guaranteed to same drive capabilities for all signals, mixing of pad drives may reduce operating speeds and may cause incorrect operation.*
- *Programming the IBFD register (I2C bus Frequency Divider) with the maximum frequency results in the minimum output timings listed. The I2C interface is designed to scale the data transition time, moving it to the middle of the SCL low period. The actual position is affected by the pre-scale and division values programmed in the IBC field of the IBFD register.*

5.1.1 Package mechanical drawings and data information

The following notes are related to *Figure 45*, *Figure 46*, *Figure 47* and *Table 65*:

1. Dimensioning and tolerancing schemes conform to ASME Y14.5M-1994.
2. The Top package body size may be smaller than the bottom package size by as much as 0.15 mm.
3. Datums A-B and D to be determined at datum plane H.
4. To be determined at seating datum plane C.
5. Dimensions D1 and E1 do not include mold flash or protrusions. Allowable mold flash or protrusions is “0.25 mm” per side. D1 and E1 are Maximum plastic body size dimensions including mold mismatch.
6. Details of pin 1 identifier are optional but must be located within the zone indicated.
7. All dimensions are in millimeter except where explicitly noted.
8. No intrusion allowed inwards the leads.
9. Dimension “b” does not include dambar protrusion. Allowable dambar protrusion shall not cause the lead width to exceed the maximum “b” dimension by more than 0.08 mm. Dambar cannot be located on the lower radius or the foot. Minimum space between protrusion and an adjacent lead is 0.07 mm for 0.4 mm and 0.5 mm pitch packages.
10. Exact shape of each corner is optional.
11. These dimensions apply to the flat section of the lead between 0.10 mm and 0.25 mm from the lead tip.
12. A1 is defined as the distance from the seating plane to the lowest point on the package body.
13. Dimensions D2 and E2 show the maximum exposed metal area on the package surface where the exposed pad is located (if present). It includes all metal protrusions from exposed pad itself. Type of exposed pad on SPC584Gx, SPC58EGx, SPC58NGx is as *Figure 48*. End user should verify D2 and E2 dimensions according to the specific device application.
14. Dimensions D3 and E3 show the minimum solderable area, defined as the portion of exposed pad which is guaranteed to be free from resin flashes/bleeds, bordered by internal edge of inner groove.
15. The optional exposed pad is generally coincident with the top or bottom side of the package and not allowed to protrude beyond that surface.
16. “N” is the max number of terminal positions for the specified body size.
17. Critical dimensions:
    a) Stand-Off
    b) Overall Width
    c) Lead Coplanarity
18. For symbols, recommended values and tolerances, see *Table 66*.

aaa	The tolerance that controls the position of the terminal pattern with respect to Datum A and B. The center of the tolerance zone for each terminal is defined by basic dimension e as related to Datum A and B.	For flange-molded packages, this tolerance also applies for basic dimensions D1 and E1. For packages tooled with intentional terminal tip protrusions, aaa does not apply to those protrusions.
bbb	The bilateral profile tolerance that controls the position of the plastic body sides. The centers of the profile zones are defined by the basic dimensions D and E.	—
ccc	The unilateral tolerance located above the seating plane where in the bottom surface of all terminals must be located.	This tolerance is commonly know as the “coplanarity” of the package terminals.
ddd	The tolerance that controls the position of the terminals to each other. The centers of the profile zones are defined by basic dimension e.	This tolerance is normally compounded with tolerance zone defined by “b”.

5.3.1 Package mechanical drawings and data information

The following notes are related to *Figure 53* and *Table 69*:

1. FPBGA stands for Fine Pitch Plastic Ball Grid Array.
   Fine pitch: e < 1.00 mm pitch.
   Low Profile: The total profile height (Dim A) is measured from the seating plane to the top of the component.
   The maximum total package height is calculated by the following methodology (tolerance values):

$$Amax = A_1(TYP) + A_2(TYP) + A_4(TYP) + \sqrt{(A_1)^2 + (A_2)^2 + (A_4)^2}$$

2. The typical ball diameter before mounting is 0.55mm.
3. Ref. JEDEC MO_219G_BGA Low Profile, Fine Pitch Ball Grid Array Family, 0.80MM Pitch (SQ. & RECT.)
4. The tolerance of position that controls the location of the pattern of balls with respect to datums A and B. For each ball there is a cylindrical tolerance zone eee perpendicular to datum C and located on true position with respect to datums A and B as defined by e. The axis perpendicular to datum C of each ball must lie within this tolerance zone.
5. The tolerance of position that controls the location of the balls within the matrix with respect to each other. For each ball there is a cylindrical tolerance zone fff perpendicular to datum C and located on true position as defined by e. The axis perpendicular to datum C of each ball must lie within this tolerance zone. Each

tolerance zone fff in the array is contained entirely in the respective zone eee above. The axis of each ball must lie simultaneously in both tolerance zones.

6. The terminal A1 corner must be identified on the top surface by using a corner chamfer, ink or metallized markings, or other feature of package body or integral heatslug. A distinguishing feature is allowable on the bottom surface of the package to identify the terminal A1 corner. Exact shape of each corner is optional.

5.4 Package thermal characteristics

5.4.4 General notes for specifications at maximum junction temperature

An estimation of the chip junction temperature, T_J, can be obtained from the equation:

Equation 1
$$T_J = T_A + (R_{\theta JA} * P_D)$$

where:

T_A = ambient temperature for the package (°C)

$R_{\theta JA}$ = junction-to-ambient thermal resistance (°C/W)

P_D = power dissipation in the package (W)

The thermal resistance values used are based on the JEDEC JESD51 series of standards to provide consistent values for estimations and comparisons. The differences between the values determined for the single-layer (1s) board compared to a four-layer board that has two signal layers, a power and a ground plane (2s2p), demonstrate that the effective thermal resistance is not a constant. The thermal resistance depends on the:

- Construction of the application board (number of planes)
- Effective size of the board which cools the component
- Quality of the thermal and electrical connections to the planes
- Power dissipated by adjacent components

Connect all the ground and power balls to the respective planes with one via per ball. Using fewer vias to connect the package to the planes reduces the thermal performance. Thinner

planes also reduce the thermal performance. When the clearance between the vias leaves the planes virtually disconnected, the thermal performance is also greatly reduced.

As a general rule, the value obtained on a single-layer board is within the normal range for the tightly packed printed circuit board. The value obtained on a board with the internal planes is usually within the normal range if the application board has:

- One oz. (35 micron nominal thickness) internal planes
- Components are well separated
- Overall power dissipation on the board is less than 0.02 W/cm^2

The thermal performance of any component depends on the power dissipation of the surrounding components. In addition, the ambient temperature varies widely within the application. For many natural convection and especially closed box applications, the board temperature at the perimeter (edge) of the package is approximately the same as the local air temperature near the device. Specifying the local ambient conditions explicitly as the board temperature provides a more precise description of the local ambient conditions that determine the temperature of the device.

At a known board temperature, the junction temperature is estimated using the following equation:

Equation 2

$$T_J = T_B + (R_{\theta JB} * P_D)$$

where:

T_B = board temperature for the package perimeter (°C)

$R_{\theta JB}$ = junction-to-board thermal resistance (°C/W) per JESD51-8

P_D = power dissipation in the package (W)

When the heat loss from the package case to the air does not factor into the calculation, the junction temperature is predictable if the application board is similar to the thermal test condition, with the component soldered to a board with internal planes.

The thermal resistance is expressed as the sum of a junction-to-case thermal resistance plus a case-to-ambient thermal resistance:

Equation 3

$$R_{\theta JA} = R_{\theta JC} + R_{\theta CA}$$

where:

$R_{\theta JA}$ = junction-to-ambient thermal resistance (°C/W)

$R_{\theta JC}$ = junction-to-case thermal resistance (°C/W)

$R_{\theta CA}$ = case to ambient thermal resistance (°C/W)

$R_{\theta JC}$ is device related and is not affected by other factors. The thermal environment can be controlled to change the case-to-ambient thermal resistance, $R_{\theta CA}$. For example, change the air flow around the device, add a heat sink, change the mounting arrangement on the printed circuit board, or change the thermal dissipation on the printed circuit board surrounding the device. This description is most useful for packages with heat sinks where 90% of the heat flow is through the case to heat sink to ambient. For most packages, a better model is required.

A more accurate two-resistor thermal model can be constructed from the junction-to-board thermal resistance and the junction-to-case thermal resistance. The junction-to-case

thermal resistance describes when using a heat sink or where a substantial amount of heat is dissipated from the top of the package. The junction-to-board thermal resistance describes the thermal performance when most of the heat is conducted to the printed circuit board. This model can be used to generate simple estimations and for computational fluid dynamics (CFD) thermal models. More accurate compact Flotherm models can be generated upon request.

To determine the junction temperature of the device in the application on a prototype board, use the thermal characterization parameter (Ψ_{JT}) to determine the junction temperature by measuring the temperature at the top center of the package case using the following equation:

Equation 4

$$T_J = T_T + (\Psi_{JT} \times P_D)$$

where:

T_T = thermocouple temperature on top of the package (°C)

Ψ_{JT} = thermal characterization parameter (°C/W)

P_D = power dissipation in the package (W)

The thermal characterization parameter is measured in compliance with the JESD51-2 specification using a 40-gauge type T thermocouple epoxied to the top center of the package case. Position the thermocouple so that the thermocouple junction rests on the package. Place a small amount of epoxy on the thermocouple junction and approximately 1 mm of wire extending from the junction. Place the thermocouple wire flat against the package case to avoid measurement errors caused by the cooling effects of the thermocouple wire.

When board temperature is perfectly defined below the device, it is possible to use the thermal characterization parameter (Ψ_{JPB}) to determine the junction temperature by measuring the temperature at the bottom center of the package case (exposed pad) using the following equation:

Equation 5

$$T_J = T_B + (\Psi_{JPB} \times P_D)$$

where:

T_T = thermocouple temperature on bottom of the package (°C)

Ψ_{JT} = thermal characterization parameter (°C/W)

P_D = power dissipation in the package (W)

Date	Revision	Changes
28-Jul-2016	1	Initial release.
09-Sep-2016	2	Changed Microsoft Excel® workbook attached to this document (was SPC584Gx_SPC58EGx_SPC58NGx_IO_Definition_v1.xlsx dated July 26, 2016). For details, refer to the sheet Revision History of the attached file “SPC584Gx_SPC58EGx_SPC58NGx_IO_Definition_v2.xlsx”. Updated *Section 4.12: ADC system* For ADC12 bit, “FAST SAR” updated to “Fast SAR” and “Slow SAR” updated to “Slow SAR (SARADC_B)” For ADC10 bit, instance of “Slow SAR” removed and “FAST SAR” replaced with “–”.

08-Feb-2018	4 (con't)	*Section 4.12: ADC system* *Table 26: ADC pin specification*: Updated Max value for C_S For parameter CP2, updated the max value from "1" to "2". Added electrical specification for $R_{20K\Omega}$ symbol. Changed Max value = 1 by 2 for Cp2 SARB channels *Table 27: SARn ADC electrical specification*: Added symbols $t_{ADCINIT}$ and $t_{ADCBIASINIT}$ Column "C" splitted and added "D" for IADV_S *Table 28: ADC-Comparator electrical specification*: Added new parameter "$t_{ADCINITSBY}$". Set min = $5/f_{ADCK}$ µs for 10-bit ADC mode, min = $2/f_{ADCK}$ for ADC comparator mode, at symbol $t_{ADCSAMPLE}$. Column "C" splitted and added "D" for I_{ADV_S} *Section 4.14: LFAST pad electrical characteristics* Introduction paragraph: – 1st sentence: hidden text "both the SIPI and" – all 2nd sentence hidden: "The same LVDS.. tables" *Section 4.14.2: LFAST and MSC/DSPILVDS interface electrical characteristics*: title completed with "and MSC/DSPI" *Section 4.15: Power management*: *Figure 15: Voltage monitor threshold definition*: right blue line adjusted on the top figure. *Section 4.15.1: Power management integration*: added sentence "It is recommended...device itself" for all devices. *Table 35: Linear regulator specifications*: Updated values for symbol "ΔIDD_{MREG}" Min: added -100 Max: added 100 *Section 4.16: Flash memory*: *Table 41: Flash memory program and erase specifications*: updated this table. *Section 4.17: AC Specifications* *Table 57: TxEN output characteristics*: added table footnote " Pad configured as VERY STRONG." *Table 58: TxD output characteristics*: changed note 3 to apply to the whole table. *Table 60: CAN timing*: added columns for "CC" and "D". *Section 5: Package information*: *Table 69: FPBGA292 package mechanical data*: updated Amax formula in table footnote 2. *Section 5.4: Package thermal characteristics*: Reformated note from introduction. *Section 6: Ordering information*: Chapter title heading changed to heading 1. *Figure 54: Ordering information scheme*: updated for Packing.
