

Arm<sup>®</sup> Cortex<sup>®</sup>-M0+ 32-bit MCU, up to 512KB Flash, 144KB RAM, 6x USART, timers, ADC, DAC, comm. I/Fs, 1.7-3.6V

Datasheet - production data

## Features

- Core: Arm<sup>®</sup> 32-bit Cortex<sup>®</sup>-M0+ CPU, frequency up to 64 MHz
- -40°C to 85°C/105°C/125°C operating temperature
- Memories
  - Up to 512 Kbytes of Flash memory with protection and securable area, two banks, read-while-write support
  - 144 Kbytes of SRAM (128 Kbytes with HW parity check)
- CRC calculation unit
- Reset and power management
  - Voltage range: 1.7 V to 3.6 V
  - Separate I/O supply pin (1.6 V to 3.6 V)
  - Power-on/Power-down reset (POR/PDR)
  - Programmable Brownout reset (BOR)
  - Programmable voltage detector (PVD)
  - Low-power modes: Sleep, Stop, Standby, Shutdown
  - V<sub>BAT</sub> supply for RTC and backup registers
- Clock management
  - 4 to 48 MHz crystal oscillator
  - 32 kHz crystal oscillator with calibration
  - Internal 16 MHz RC with PLL option (±1 %)
  - Internal 32 kHz RC oscillator (±5 %)
- Up to 94 fast I/Os
  - All mappable on external interrupt vectors
  - Multiple 5 V-tolerant I/Os
- 12-channel DMA controller with flexible mapping
- 12-bit, 0.4 μs ADC (up to 16 ext. channels)
  - Up to 16-bit with hardware oversampling
  - Conversion range: 0 to 3.6V
- Two 12-bit DACs, low-power sample-and-hold
- Three fast low-power analog comparators, with programmable input and output, rail-to-rail
- 15 timers (two 128 MHz capable): 16-bit for advanced motor control, one 32-bit and six 16-bit general-purpose, two basic 16-bit, two low-power 16-bit, two watchdogs, SysTick timer
- Calendar RTC with alarm and periodic wakeup from Stop/Standby/Shutdown

- Communication interfaces
  - Three I<sup>2</sup>C-bus interfaces supporting Fast-mode Plus (1 Mbit/s) with extra current sink, two supporting SMBus/PMBus and wakeup from Stop mode
  - Six USARTs with master/slave synchronous SPI; three supporting ISO7816 interface, LIN, IrDA capability, auto baud rate detection and wakeup feature
  - Two low-power UARTs
  - Three SPIs (32 Mbit/s) with 4- to 16-bit programmable bitframe, two multiplexed with I<sup>2</sup>S interface
  - HDMI CEC interface, wakeup on header
- USB 2.0 FS device (crystal-less) and host controller
- USB Type-C™ Power Delivery controller
- Two FDCAN controllers
- Development support: serial wire debug (SWD)
- 96-bit unique ID
- All packages ECOPACK 2 compliant

Table 1. Device summary

Reference	Part number

# 1 Introduction

This document provides information on STM32G0B1xB/xC/xE microcontrollers, such as description, functional overview, pin assignment and definition, electrical characteristics, packaging, and ordering codes.

Information on memory mapping and control registers is object of reference manual.

Information on Arm<sup>®(a)</sup> Cortex<sup>®</sup>-M0+ core is available from the [www.arm.com](http://www.arm.com) website.

arm

a. Arm is a registered trademark of Arm Limited (or its subsidiaries) in the US and/or elsewhere.

## 2 Description

The STM32G0B1xB/xC/xE mainstream microcontrollers are based on high-performance Arm® Cortex®-M0+ 32-bit RISC core operating at up to 64 MHz frequency. Offering a high level of integration, they are suitable for a wide range of applications in consumer, industrial and appliance domains and ready for the Internet of Things (IoT) solutions.

The devices incorporate a memory protection unit (MPU), high-speed embedded memories (144 Kbytes of SRAM and up to 512 Kbytes of Flash program memory with read protection, write protection, proprietary code protection, and securable area), DMA, an extensive range of system functions, enhanced I/Os, and peripherals. The devices offer standard communication interfaces (three I<sup>2</sup>Cs, three SPIs / two I<sup>2</sup>S, one HDMI CEC, one full-speed USB, two FD CANs, and six USARTs), one 12-bit ADC (2.5 MSps) with up to 19 channels, one 12-bit DAC with two channels, three fast comparators, an internal voltage reference buffer, a low-power RTC, an advanced control PWM timer running at up to double the CPU frequency, six general-purpose 16-bit timers with one running at up to double the CPU frequency, a 32-bit general-purpose timer, two basic timers, two low-power 16-bit timers, two watchdog timers, and a SysTick timer. The devices provide a fully integrated USB Type-C Power Delivery controller.

The devices operate within ambient temperatures from -40 to 125°C and with supply voltages from 1.7 V to 3.6 V. Optimized dynamic consumption combined with a comprehensive set of power-saving modes, low-power timers and low-power UART, allows the design of low-power applications.

VBAT direct battery input allows keeping RTC and backup registers powered.

The devices come in packages with 32 to 100 pins. Some packages with low pin count are available in two pinouts (standard and alternative indicated by “N” suffix). Products marked by N suffix are offering V<sub>DDIO2</sub> supply and additional UCPD port versus the standard pinout, therefore those are better choice for UCPD/USB applications.

## 3 Functional overview

### 3.1 Arm<sup>®</sup> Cortex<sup>®</sup>-M0+ core with MPU

The Cortex-M0+ is an entry-level 32-bit Arm Cortex processor designed for a broad range of embedded applications. It offers significant benefits to developers, including:

- a simple architecture, easy to learn and program
- ultra-low power, energy-efficient operation
- excellent code density
- deterministic, high-performance interrupt handling
- upward compatibility with Cortex-M processor family
- platform security robustness, with integrated Memory Protection Unit (MPU).

The Cortex-M0+ processor is built on a highly area- and power-optimized 32-bit core, with a 2-stage pipeline Von Neumann architecture. The processor delivers exceptional energy efficiency through a small but powerful instruction set and extensively optimized design, providing high-end processing hardware including a single-cycle multiplier.

The Cortex-M0+ processor provides the exceptional performance expected of a modern 32-bit architecture, with a higher code density than other 8-bit and 16-bit microcontrollers.

Owing to embedded Arm core, the STM32G0B1xB/xC/xE devices are compatible with Arm tools and software.

The Cortex-M0+ is tightly coupled with a nested vectored interrupt controller (NVIC) described in [Section 3.13.1](#).

### 3.2 Memory protection unit

The memory protection unit (MPU) is used to manage the CPU accesses to memory to prevent one task to accidentally corrupt the memory or resources used by any other active task.

The MPU is especially helpful for applications where some critical or certified code has to be protected against the misbehavior of other tasks. It is usually managed by an RTOS (real-time operating system). If a program accesses a memory location that is prohibited by the MPU, the RTOS can detect it and take action. In an RTOS environment, the kernel can dynamically update the MPU area setting, based on the process to be executed.

The MPU is optional and can be bypassed for applications that do not need it.

### 3.3 Embedded Flash memory

STM32G0B1xB/xC/xE devices feature up to 512 Kbytes of embedded Flash memory available for storing code and data.

Flexible protections can be configured thanks to option bytes:

- Readout protection (RDP) to protect the whole memory. Three levels are available:
  - Level 0: no readout protection
  - Level 1: memory readout protection: the Flash memory cannot be read from or written to if either debug features are connected, boot in RAM or bootloader is selected
  - Level 2: chip readout protection: debug features (Cortex-M0+ serial wire), boot in RAM and bootloader selection are disabled. This selection is irreversible.

**Table 3. Access status versus readout protection level and execution modes**

Area	Protection level	User execution			Debug, boot from RAM or boot from system memory (loader)		
		Read	Write	Erase	Read	Write	Erase
User memory	1	Yes	Yes	Yes	No	No	No
	2	Yes	Yes	Yes	N/A	N/A	N/A
System memory	1	Yes	No	No	Yes	No	No
	2	Yes	No	No	N/A	N/A	N/A
Option bytes	1	Yes	Yes	Yes	Yes	Yes	Yes
	2	Yes	No	No	N/A	N/A	N/A
Backup registers	1	Yes	Yes	N/A <sup>(1)</sup>	No	No	N/A <sup>(1)</sup>
	2	Yes	Yes	N/A	N/A	N/A	N/A

1. Erased upon RDP change from Level 1 to Level 0.

- Write protection (WRP): the protected area is protected against erasing and programming. Two areas per bank can be selected, with 2-Kbyte granularity.
- Proprietary code readout protection (PCROP): a part of the Flash memory can be protected against read and write from third parties. The protected area is execute-only: it can only be reached by the STM32 CPU as instruction code, while all other accesses (DMA, debug and CPU data read, write and erase) are strictly prohibited. An additional option bit (PCROP\_RDP) determines whether the PCROP area is erased or not when the RDP protection is changed from Level 1 to Level 0.

The whole non-volatile memory embeds the error correction code (ECC) feature supporting:

- single error detection and correction
- double error detection
- readout of the ECC fail address from the ECC register

### 3.3.1 Securable area

A part of the Flash memory can be hidden from the application once the code it contains is executed. As soon as the write-once SEC\_PROT bit is set, the securable memory cannot be accessed until the system resets. The securable area generally contains the secure boot code to execute only once at boot. This helps to isolate secret code from untrusted application code.

### 3.4 Embedded SRAM

STM32G0B1xB/xC/xE devices have 128 Kbytes of embedded SRAM with parity. Hardware parity check allows memory data errors to be detected, which contributes to increasing functional safety of applications.

When the parity protection is not required because the application is not safety-critical, the parity memory bits can be used as additional SRAM, to increase its total size to 144 Kbytes.

The memory can be read/write-accessed at CPU clock speed, with 0 wait states.

### 3.5 Boot modes

At startup, the boot pin and boot selector option bit are used to select one of the three boot options:

- boot from User Flash memory
- boot from System memory
- boot from embedded SRAM

The boot pin is shared with a standard GPIO and can be enabled through the boot selector option bit. The boot loader is located in System memory. It manages the Flash memory reprogramming through one of the following interfaces:

- USART on pins PA9/PA10, PC10/PC11, or PA2/PA3
- I<sup>2</sup>C-bus on pins PB6/PB7 or PB10/PB11
- SPI on pins PA4/PA5/PA6/PA7 or PB12/PB13/PB14/PB15
- USB on pins PA11/PA12
- FDCAN on pins PD0/PD1

### 3.6 Cyclic redundancy check calculation unit (CRC)

The CRC (cyclic redundancy check) calculation unit is used to get a CRC code using a configurable generator polynomial value and size.

Among other applications, CRC-based techniques are used to verify data transmission or storage integrity. In the scope of the EN/IEC 60335-1 standard, they offer a means of verifying the Flash memory integrity. The CRC calculation unit helps compute a signature of the software during runtime, to be compared with a reference signature generated at link time and stored at a given memory location.

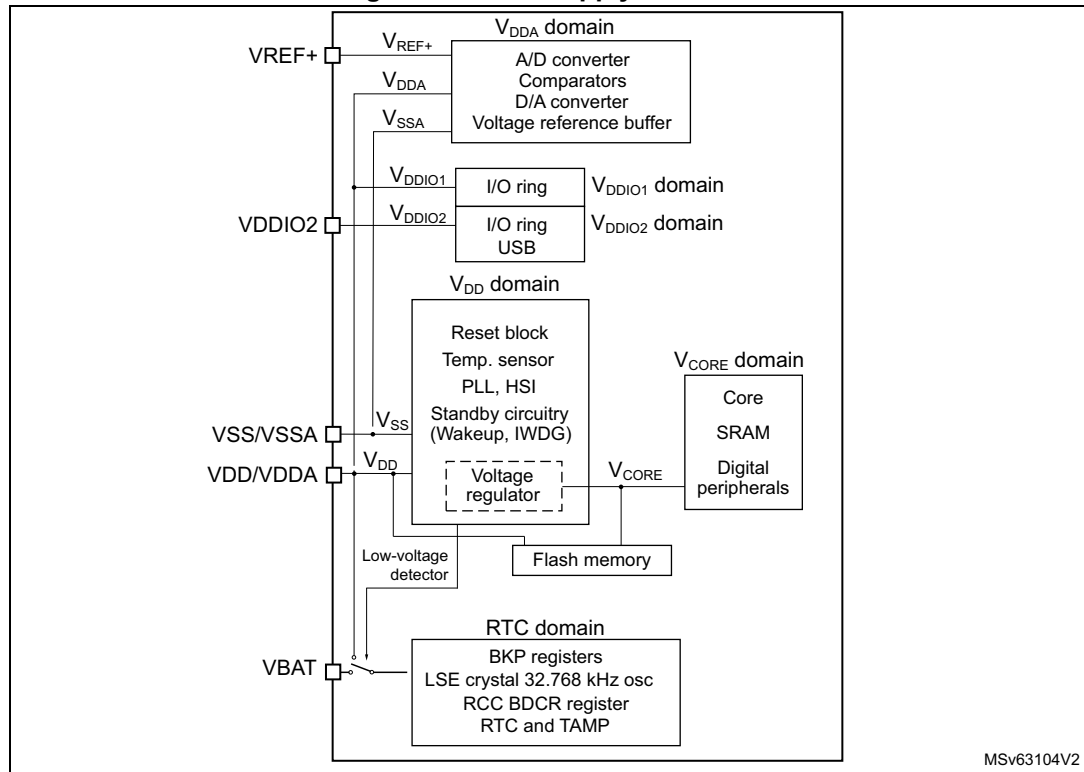

## 3.7 Power supply management

### 3.7.1 Power supply schemes

The STM32G0B1xB/xC/xE devices require a 1.7 V to 3.6 V operating supply voltage ( $V_{DD}$ ). Several different power supplies are provided to specific peripherals:

- $V_{DD} = 1.7$  (1.6) to 3.6 V  
 $V_{DD}$  is the external power supply for the internal regulator and the system analog such as reset, power management and internal clocks. It is provided externally through VDD/VDDA pin.  
 The minimum voltage of 1.7 V corresponds to power-on reset release threshold  $V_{POR(max)}$ . Once this threshold is crossed and power-on reset is released, the functionality is guaranteed down to power-down reset threshold  $V_{PDR(min)}$ .
- $V_{DDA} = 1.62$  V (ADC and COMP) / 1.8 V (DAC) / 2.4 V (VREFBUF) to 3.6 V  
 $V_{DDA}$  is the analog power supply for the A/D converter, D/A converter, voltage reference buffer and comparators.  $V_{DDA}$  voltage level is identical to  $V_{DD}$  voltage as it is provided externally through VDD/VDDA pin.
- $V_{DDIO1} = V_{DD}$   
 $V_{DDIO1}$  is the power supply for the I/Os.  $V_{DDIO1}$  voltage level is identical to  $V_{DD}$  voltage as it is provided externally through VDD/VDDA pin.
- $V_{DDIO2} = 1.6$  to 3.6 V  
 $V_{DDIO2}$  is the power supply from VDDIO2 pin for selected I/Os and  $V_{DDUSB}$ . On packages without VDDIO2 pin,  $V_{DDUSB}$  and  $V_{DDIO2}$  are internally connected with  $V_{DD}$ . Although  $V_{DDIO2}$  is independent of  $V_{DD}$  or  $V_{DDA}$ , it must not be applied without valid  $V_{DD}$ .
- $V_{BAT} = 1.55$  V to 3.6 V.  $V_{BAT}$  is the power supply (through a power switch) for RTC, TAMP, low-speed external 32.768 kHz oscillator and backup registers when  $V_{DD}$  is not present.  $V_{BAT}$  is provided externally through VBAT pin. When this pin is not available on the package, VBAT bonding pad is internally bonded to the VDD/VDDA pin.
- $V_{REF+}$  is the analog peripheral input reference voltage, or the output of the internal voltage reference buffer (when enabled). When  $V_{DDA} < 2$  V,  $V_{REF+}$  must be equal to  $V_{DDA}$ . When  $V_{DDA} \geq 2$  V,  $V_{REF+}$  must be between 2 V and  $V_{DDA}$ . It can be grounded when the analog peripherals using  $V_{REF+}$  are not active.  
 The internal voltage reference buffer supports two output voltages, which is configured with VRS bit of the VREFBUF\_CSR register:
  - $V_{REF+}$  around 2.048 V (requiring  $V_{DDA}$  equal to or higher than 2.4 V)
  - $V_{REF+}$  around 2.5 V (requiring  $V_{DDA}$  equal to or higher than 2.8 V) $V_{REF+}$  is delivered through VREF+ pin. On packages without VREF+ pin,  $V_{REF+}$  is internally connected with  $V_{DD}$ , and the internal voltage reference buffer must be kept disabled (refer to datasheets for package pinout description).
- $V_{CORE}$   
 An embedded linear voltage regulator is used to supply the  $V_{CORE}$  internal digital power.  $V_{CORE}$  is the power supply for digital peripherals, SRAM and Flash memory. The Flash memory is also supplied with  $V_{DD}$ .

Figure 2. Power supply overview

### 3.7.2 Power supply supervisor

The device has an integrated power-on/power-down (POR/PDR) reset active in all power modes except Shutdown and ensuring proper operation upon power-on and power-down. It maintains the device in reset when the supply voltage is below  $V_{POR/PDR}$  threshold, without the need for an external reset circuit. Brownout reset (BOR) function allows extra flexibility. It can be enabled and configured through option bytes, by selecting one of four thresholds for rising  $V_{DD}$  and other four for falling  $V_{DD}$ .

The device also features an embedded programmable voltage detector (PVD) that monitors the  $V_{DD}$  power supply and compares it to  $V_{PVD}$  threshold. It allows generating an interrupt when  $V_{DD}$  level crosses the  $V_{PVD}$  threshold, selectively while falling, while rising, or while falling and rising. The interrupt service routine can then generate a warning message and/or put the MCU into a safe state. The PVD is enabled by software.

### 3.7.3 Voltage regulator

Two embedded linear voltage regulators, main regulator (MR) and low-power regulator (LPR), supply most of digital circuitry in the device.

The MR is used in Run and Sleep modes. The LPR is used in Low-power run, Low-power sleep and Stop modes.

In Standby and Shutdown modes, both regulators are powered down and their outputs set in high-impedance state, such as to bring their current consumption close to zero. However, SRAM data retention is possible in Standby mode, in which case the LPR remains active and it only supplies the SRAM.

### 3.7.4 Low-power modes

By default, the microcontroller is in Run mode after system or power reset. It is up to the user to select one of the low-power modes described below:

- **Sleep mode**

In Sleep mode, only the CPU is stopped. All peripherals continue to operate and can wake up the CPU when an interrupt/event occurs.
- **Low-power run mode**

This mode is achieved with  $V_{CORE}$  supplied by the low-power regulator to minimize the regulator's operating current. The code can be executed from SRAM or from Flash, and the CPU frequency is limited to 2 MHz. The peripherals with independent clock can be clocked by HSI16.
- **Low-power sleep mode**

This mode is entered from the low-power run mode. Only the CPU clock is stopped. When wakeup is triggered by an event or an interrupt, the system reverts to the Low-power run mode.
- **Stop 0 and Stop 1 modes**

In Stop 0 and Stop 1 modes, the device achieves the lowest power consumption while retaining the SRAM and register contents. All clocks in the  $V_{CORE}$  domain are stopped. The PLL, as well as the HSI16 RC oscillator and the HSE crystal oscillator are disabled. The LSE or LSI keep running. The RTC can remain active (Stop mode with RTC, Stop mode without RTC).

Some peripherals with wakeup capability can enable the HSI16 RC during Stop mode, so as to get clock for processing the wakeup event. The main regulator remains active in Stop 0 mode while it is turned off in Stop 1 mode.
- **Standby mode**

The Standby mode is used to achieve the lowest power consumption, with POR/PDR always active in this mode. The main regulator is switched off to power down  $V_{CORE}$  domain. The low-power regulator is either switched off or kept active. In the latter case, it only supplies SRAM to ensure data retention. The PLL, as well as the HSI16 RC oscillator and the HSE crystal oscillator are also powered down. The RTC can remain active (Standby mode with RTC, Standby mode without RTC).

For each I/O, the software can determine whether a pull-up, a pull-down or no resistor shall be applied to that I/O during Standby mode.

Upon entering Standby mode, register contents are lost except for registers in the RTC domain and standby circuitry. The SRAM contents can be retained through register setting.

The device exits Standby mode upon external reset event (NRST pin), IWDG reset event, wakeup event (WKUP pin, configurable rising or falling edge) or RTC event (alarm, periodic wakeup, timestamp, tamper), or when a failure is detected on LSE (CSS on LSE).
- **Shutdown mode**

The Shutdown mode allows to achieve the lowest power consumption. The internal regulator is switched off to power down the  $V_{CORE}$  domain. The PLL, as well as the

HSI16 and LSI RC-oscillators and HSE crystal oscillator are also powered down. The RTC can remain active (Shutdown mode with RTC, Shutdown mode without RTC).

The BOR is not available in Shutdown mode. No power voltage monitoring is possible in this mode. Therefore, switching to RTC domain is not supported.

SRAM and register contents are lost except for registers in the RTC domain.

The device exits Shutdown mode upon external reset event (NRST pin), IWDG reset event, wakeup event (WKUP pin, configurable rising or falling edge) or RTC event (alarm, periodic wakeup, timestamp, tamper).

### 3.7.5 Reset mode

During and upon exiting reset, the schmitt triggers of I/Os are disabled so as to reduce power consumption. In addition, when the reset source is internal, the built-in pull-up resistor on NRST pin is deactivated.

### 3.7.6 VBAT operation

The  $V_{BAT}$  power domain, consuming very little energy, includes RTC, and LSE oscillator and backup registers.

In VBAT mode, the RTC domain is supplied from VBAT pin. The power source can be, for example, an external battery or an external supercapacitor. Two anti-tamper detection pins are available.

The RTC domain can also be supplied from VDD/VDDA pin.

By means of a built-in switch, an internal voltage supervisor allows automatic switching of RTC domain powering between  $V_{DD}$  and voltage from VBAT pin to ensure that the supply voltage of the RTC domain ( $V_{BAT}$ ) remains within valid operating conditions. If both voltages are valid, the RTC domain is supplied from VDD/VDDA pin.

An internal circuit for charging the battery on VBAT pin can be activated if the  $V_{DD}$  voltage is within a valid range.

*Note: External interrupts and RTC alarm/events cannot cause the microcontroller to exit the VBAT mode, as in that mode the  $V_{DD}$  is not within a valid range.*

## 3.8 Interconnect of peripherals

Several peripherals have direct connections between them. This allows autonomous communication between peripherals, saving CPU resources thus power supply consumption. In addition, these hardware connections allow fast and predictable latency.

Depending on peripherals, these interconnections can operate in Run, Sleep and Stop modes.

**Table 4. Interconnect of peripherals**

Interconnect source	Interconnect destination	Interconnect action	Run Low-power run	Sleep Low-power sleep	Stop
TIMx	TIMx	Timer synchronization or chaining	Y	Y	-
	ADCx DACx	Conversion triggers	Y	Y	-
	DMA	Memory-to-memory transfer trigger	Y	Y	-
	COMPx	Comparator output blanking	Y	Y	-
COMPx	TIM1,2,3,4	Timer input channel, trigger, break from analog signals comparison	Y	Y	-
	LPTIMERx	Low-power timer triggered by analog signals comparison	Y	Y	Y
ADCx	TIM1	Timer triggered by analog watchdog	Y	Y	-
RTC	TIM16	Timer input channel from RTC events	Y	Y	-
	LPTIMERx	Low-power timer triggered by RTC alarms or tampers	Y	Y	Y
All clock sources (internal and external)	TIM14,16,17	Clock source used as input channel for RC measurement and trimming	Y	Y	-
CSS RAM (parity error) Flash memory (ECC error) COMPx PVD	TIM1,15,16,17	Timer break	Y	Y	-
CPU (hard fault)	TIM1,15,16,17	Timer break	Y	-	-
GPIO	TIMx	External trigger	Y	Y	-
	LPTIMERx	External trigger	Y	Y	Y
	ADC DACx	Conversion external trigger	Y	Y	-

## 3.9 Clocks and startup

The clock controller distributes the clocks coming from different oscillators to the core and the peripherals. It also manages clock gating for low-power modes and ensures clock robustness. It features:

- **Clock prescaler:** to get the best trade-off between speed and current consumption, the clock frequency to the CPU and peripherals can be adjusted by a programmable prescaler
- **Safe clock switching:** clock sources can be changed safely on the fly in run mode through a configuration register.
- **Clock management:** to reduce power consumption, the clock controller can stop the clock to the core, individual peripherals or memory.
- **System clock source:** three different sources can deliver SYSCLK system clock:
  - 4-48 MHz high-speed oscillator with external crystal or ceramic resonator (HSE). It can supply clock to system PLL. The HSE can also be configured in bypass mode for an external clock.
  - 16 MHz high-speed internal RC oscillator (HSI16), trimmable by software. It can supply clock to system PLL.
  - System PLL with maximum output frequency of 64 MHz. It can be fed with HSE or HSI16 clocks.
- **Auxiliary clock source:** two ultra-low-power clock sources for the real-time clock (RTC):
  - 32.768 kHz low-speed oscillator with external crystal (LSE), supporting four drive capability modes. The LSE can also be configured in bypass mode for using an external clock.
  - 32 kHz low-speed internal RC oscillator (LSI) with  $\pm 5\%$  accuracy, also used to clock an independent watchdog.
- **USB clock source:**
  - HSI 48 MHz in association with CRS can provide a dedicated clock to USB FS allowing the peripheral to operate as device without requiring an external resonator
- **Peripheral clock sources:** several peripherals ( I2S, USARTs, I2Cs, LPTIMs, ADC, USB FS) have their own clock independent of the system clock.
- **Clock security system (CSS):** in the event of HSE clock failure, the system clock is automatically switched to HSI16 and, if enabled, a software interrupt is generated. LSE clock failure can also be detected and generate an interrupt. The CCS feature can be enabled by software.
- **Clock output:**
  - **MCO (microcontroller clock output)** provides one of the internal clocks for external use by the application
  - **LSCO (low speed clock output)** provides LSI or LSE in all low-power modes (except in VBAT operation).

Several prescalers allow the application to configure AHB and APB domain clock frequencies, 64 MHz at maximum.

### 3.10 General-purpose inputs/outputs (GPIOs)

Each of the GPIO pins can be configured by software as output (push-pull or open-drain), as input (with or without pull-up or pull-down) or as peripheral alternate function (AF). Most of the GPIO pins are shared with special digital or analog functions.

Through a specific sequence, this special function configuration of I/Os can be locked, such as to avoid spurious writing to I/O control registers.

### 3.11 Direct memory access controller (DMA)

The direct memory access (DMA) controller is a bus master and system peripheral with single-AHB architecture.

With 12 channels, it performs data transfers between memory-mapped peripherals and/or memories, to offload the CPU.

Each channel is dedicated to managing memory access requests from one or more peripherals. The unit includes an arbiter for handling the priority between DMA requests.

Main features of the DMA controller:

- Single-AHB master
- Peripheral-to-memory, memory-to-peripheral, memory-to-memory and peripheral-to-peripheral data transfers
- Access, as source and destination, to on-chip memory-mapped devices such as Flash memory, SRAM, and AHB and APB peripherals
- All DMA channels independently configurable:
  - Each channel is associated either with a DMA request signal coming from a peripheral, or with a software trigger in memory-to-memory transfers. This configuration is done by software.
  - Priority between the requests is programmable by software (four levels per channel: very high, high, medium, low) and by hardware in case of equality (such as request to channel 1 has priority over request to channel 2).
  - Transfer size of source and destination are independent (byte, half-word, word), emulating packing and unpacking. Source and destination addresses must be aligned on the data size.
  - Support of transfers from/to peripherals to/from memory with circular buffer management
  - Programmable number of data to be transferred: 0 to  $2^{16} - 1$
- Generation of an interrupt request per channel. Each interrupt request originates from any of the three DMA events: transfer complete, half transfer, or transfer error.

### 3.12 DMA request multiplexer (DMAMUX)

The DMAMUX request multiplexer enables routing a DMA request line between the peripherals and the DMA controller. Each channel selects a unique DMA request line, unconditionally or synchronously with events from its DMAMUX synchronization inputs. DMAMUX may also be used as a DMA request generator from programmable events on its input trigger signals.

## 3.13 Interrupts and events

The device flexibly manages events causing interrupts of linear program execution, called exceptions. The Cortex-M0+ processor core, a nested vectored interrupt controller (NVIC) and an extended interrupt/event controller (EXTI) are the assets contributing to handling the exceptions. Exceptions include core-internal events such as, for example, a division by zero and, core-external events such as logical level changes on physical lines. Exceptions result in interrupting the program flow, executing an interrupt service routine (ISR) then resuming the original program flow.

The processor context (contents of program pointer and status registers) is stacked upon program interrupt and unstacked upon program resume, by hardware. This avoids context stacking and unstacking in the interrupt service routines (ISRs) by software, thus saving time, code and power. The ability to abandon and restart load-multiple and store-multiple operations significantly increases the device's responsiveness in processing exceptions.

### 3.13.1 Nested vectored interrupt controller (NVIC)

The configurable nested vectored interrupt controller is tightly coupled with the core. It handles physical line events associated with a non-maskable interrupt (NMI) and maskable interrupts, and Cortex-M0+ exceptions. It provides flexible priority management.

The tight coupling of the processor core with NVIC significantly reduces the latency between interrupt events and start of corresponding interrupt service routines (ISRs). The ISR vectors are listed in a vector table, stored in the NVIC at a base address. The vector address of an ISR to execute is hardware-built from the vector table base address and the ISR order number used as offset.

If a higher-priority interrupt event happens while a lower-priority interrupt event occurring just before is waiting for being served, the later-arriving higher-priority interrupt event is served first. Another optimization is called tail-chaining. Upon a return from a higher-priority ISR then start of a pending lower-priority ISR, the unnecessary processor context unstacking and stacking is skipped. This reduces latency and contributes to power efficiency.

Features of the NVIC:

- Low-latency interrupt processing
- 4 priority levels
- Handling of a non-maskable interrupt (NMI)
- Handling of 32 maskable interrupt lines
- Handling of 10 Cortex-M0+ exceptions
- Later-arriving higher-priority interrupt processed first
- Tail-chaining
- Interrupt vector retrieval by hardware

### 3.13.2 Extended interrupt/event controller (EXTI)

The extended interrupt/event controller adds flexibility in handling physical line events and allows identifying wake-up events at processor wakeup from Stop mode.

The EXTI controller has a number of channels, of which some with rising, falling or rising, and falling edge detector capability. Any GPIO and a few peripheral signals can be connected to these channels.

The channels can be independently masked.

The EXTI controller can capture pulses shorter than the internal clock period.

A register in the EXTI controller latches every event even in Stop mode, which allows the software to identify the origin of the processor's wake-up from Stop mode or, to identify the GPIO and the edge event having caused an interrupt.

### 3.14 Analog-to-digital converter (ADC)

A native 12-bit analog-to-digital converter is embedded into STM32G0B1xB/xC/xE devices. It can be extended to 16-bit resolution through hardware oversampling. The ADC has up to 16 external channels and 3 internal channels (temperature sensor, voltage reference,  $V_{BAT}$  monitoring). It performs conversions in single-shot or scan mode. In scan mode, automatic conversion is performed on a selected group of analog inputs.

The ADC frequency is independent from the CPU frequency, allowing maximum sampling rate of ~2 MSps even with a low CPU speed. An auto-shutdown function guarantees that the ADC is powered off except during the active conversion phase.

The ADC can be served by the DMA controller. It can operate in the whole  $V_{DD}$  supply range.

The ADC features a hardware oversampler up to 256 samples, improving the resolution to 16 bits (refer to AN2668).

An analog watchdog feature allows very precise monitoring of the converted voltage of one, some or all scanned channels. An interrupt is generated when the converted voltage is outside the programmed thresholds.

The events generated by the general-purpose timers (TIMx) can be internally connected to the ADC start triggers, to allow the application to synchronize A/D conversions with timers.

#### 3.14.1 Temperature sensor

The temperature sensor (TS) generates a voltage  $V_{TS}$  that varies linearly with temperature.

The temperature sensor is internally connected to an ADC input to convert the sensor output voltage into a digital value.

The sensor provides good linearity but it has to be calibrated to obtain good overall accuracy of the temperature measurement. As the offset of the temperature sensor may vary from part to part due to process variation, the uncalibrated internal temperature sensor is suitable only for relative temperature measurements.

To improve the accuracy of the temperature sensor, each part is individually factory-calibrated by ST. The resulting calibration data are stored in the part's engineering bytes, accessible in read-only mode.

Table 5. Temperature sensor calibration values

Calibration value name	Description	Memory address
TS_CAL1	TS ADC raw data acquired at a temperature of 30 °C ( $\pm 5$ °C), $V_{DDA} = V_{REF+} = 3.0$ V ( $\pm 10$ mV)	0x1FFF 75A8 - 0x1FFF 75A9
TS_CAL2	TS ADC raw data acquired at a temperature of 130 °C ( $\pm 5$ °C), $V_{DDA} = V_{REF+} = 3.0$ V ( $\pm 10$ mV)	0x1FFF 75CA - 0x1FFF 75CB

### 3.14.2 Internal voltage reference ( $V_{REFINT}$ )

The internal voltage reference ( $V_{REFINT}$ ) provides a stable (bandgap) voltage output for the ADC and comparators.  $V_{REFINT}$  is internally connected to an ADC input. The  $V_{REFINT}$  voltage is individually precisely measured for each part by ST during production test and stored in the part's engineering bytes. It is accessible in read-only mode.

Table 6. Internal voltage reference calibration values

Calibration value name	Description	Memory address
$V_{REFINT}$	Raw data acquired at a temperature of 30 °C ( $\pm 5$ °C), $V_{DDA} = V_{REF+} = 3.0$ V ( $\pm 10$ mV)	0x1FFF 75AA - 0x1FFF 75AB

### 3.14.3 $V_{BAT}$ battery voltage monitoring

This embedded hardware feature allows the application to measure the  $V_{BAT}$  battery voltage using an internal ADC input. As the  $V_{BAT}$  voltage may be higher than  $V_{DDA}$  and thus outside the ADC input range, the VBAT pin is internally connected to a bridge divider by three. As a consequence, the converted digital value is one third the  $V_{BAT}$  voltage.

## 3.15 Digital-to-analog converter (DAC)

The 2-channel 12-bit buffered DAC converts a digital value into an analog voltage available on the channel output. The architecture of either channel is based on integrated resistor string and an inverting amplifier. The digital circuitry is common for both channels.

Features of the DAC:

- Two DAC output channels
- 8-bit or 12-bit output mode
- Buffer offset calibration (factory and user trimming)
- Left or right data alignment in 12-bit mode
- Synchronized update capability
- Noise-wave generation
- Triangular-wave generation
- Independent or simultaneous conversion for DAC channels
- DMA capability for either DAC channel
- Triggering with timer events, synchronized with DMA
- Triggering with external events
- Sample-and-hold low-power mode, with internal or external capacitor

### 3.16 Voltage reference buffer (VREFBUF)

When enabled, an embedded buffer provides the internal reference voltage to analog blocks (for example ADC) and to VREF+ pin for external components.

The internal voltage reference buffer supports two voltages:

- 2.048 V
- 2.5 V

An external voltage reference can be provided through the VREF+ pin when the internal voltage reference buffer is disabled.

On some packages, the VREF+ pad of the silicon die is double-bonded with supply pad to common VDD/VDDA pin and so the internal voltage reference buffer cannot be used.

### 3.17 Comparators (COMP)

Three embedded rail-to-rail analog comparators have programmable reference voltage (internal or external), hysteresis, speed (low for low-power) and output polarity.

The reference voltage can be one of the following:

- external, from an I/O
- internal, from DAC
- internal reference voltage ( $V_{REFINT}$ ) or its submultiple (1/4, 1/2, 3/4)

The comparators can wake up the device from Stop mode, generate interrupts, breaks or triggers for the timers and can be also combined into a window comparator.

### 3.18 Timers and watchdogs

The device includes an advanced-control timer, seven general-purpose timers, two basic timers, two low-power timers, two watchdog timers and a SysTick timer. [Table 7](#) compares features of the advanced-control, general-purpose and basic timers.

Table 7. Timer feature comparison

Timer type	Timer	Counter resolution	Counter type	Maximum operating frequency	Prescaler factor	DMA request generation	Capture/compare channels	Complementary outputs
Advanced-control	TIM1	16-bit	Up, down, up/down	128 MHz	Integer from 1 to 2 <sup>16</sup>	Yes	4	3
General-purpose	TIM2	32-bit	Up, down, up/down	64 MHz	Integer from 1 to 2 <sup>16</sup>	Yes	4	-
	TIM3	16-bit	Up, down, up/down	64 MHz	Integer from 1 to 2 <sup>16</sup>	Yes	4	-
	TIM4	16-bit	Up, down, up/down	64 MHz	Integer from 1 to 2 <sup>16</sup>	Yes	4	-
	TIM14	16-bit	Up	64 MHz	Integer from 1 to 2 <sup>16</sup>	No	1	-
	TIM15	16-bit	Up	128 MHz	Integer from 1 to 2 <sup>16</sup>	Yes	2	1
	TIM16 TIM17	16-bit	Up	64 MHz	Integer from 1 to 2 <sup>16</sup>	Yes	1	1
Basic	TIM6 TIM7	16-bit	Up	64 MHz	Integer from 1 to 2 <sup>16</sup>	Yes	-	-
Low-power	LPTIM1 LPTIM2	16-bit	Up	64 MHz	2 <sup>n</sup> where n=0 to 7	No	N/A	-

### 3.18.1 Advanced-control timer (TIM1)

The advanced-control timer can be seen as a three-phase PWM unit multiplexed on 6 channels. It has complementary PWM outputs with programmable inserted dead-times. It can also be seen as a complete general-purpose timer. The four independent channels can be used for:

- input capture
- output compare
- PWM output (edge or center-aligned modes) with full modulation capability (0-100%)
- one-pulse mode output

In debug mode, the advanced-control timer counter can be frozen and the PWM outputs disabled, so as to turn off any power switches driven by these outputs.

Many features are shared with those of the general-purpose TIMx timers (described in [Section 3.18.2](#)) using the same architecture, so the advanced-control timers can work together with the TIMx timers via the Timer Link feature for synchronization or event chaining.

### 3.18.2 General-purpose timers (TIM2, 3, 4, 14, 15, 16, 17)

There are seven synchronizable general-purpose timers embedded in the device (refer to [Table 7](#) for comparison). Each general-purpose timer can be used to generate PWM outputs or act as a simple timebase.

- TIM2, TIM3, and TIM4

These are full-featured general-purpose timers:

- TIM2 with 32-bit auto-reload up/downcounter and 16-bit prescaler
- TIM3 and TIM4 with 16-bit auto-reload up/downcounter and 16-bit prescaler

They have four independent channels for input capture/output compare, PWM or one-pulse mode output. They can operate in combination with other general-purpose timers via the Timer Link feature for synchronization or event chaining. They can generate independent DMA request and support quadrature encoders. Their counter can be frozen in debug mode.

- TIM14

This timer is based on a 16-bit auto-reload upcounter and a 16-bit prescaler. It has one channel for input capture/output compare, PWM output or one-pulse mode output. Its counter can be frozen in debug mode.

- TIM15, TIM16, TIM17

These are general-purpose timers featuring:

- 16-bit auto-reload upcounter and 16-bit prescaler
- 2 channels and 1 complementary channel for TIM15
- 1 channel and 1 complementary channel for TIM16 and TIM17

All channels can be used for input capture/output compare, PWM or one-pulse mode output. The timers can operate together via the Timer Link feature for synchronization or event chaining. They can generate independent DMA request. Their counters can be frozen in debug mode.

### 3.18.3 Basic timers (TIM6 and TIM7)

These timers are mainly used for triggering DAC conversions. They can also be used as generic 16-bit timebases.

### 3.18.4 Low-power timers (LPTIM1 and LPTIM2)

These timers have an independent clock. When fed with LSE, LSI or external clock, they keep running in Stop mode and they can wake up the system from it.

Features of LPTIM1 and LPTIM2:

- 16-bit up counter with 16-bit autoreload register
- 16-bit compare register
- Configurable output (pulse, PWM)
- Continuous/one-shot mode
- Selectable software/hardware input trigger
- Selectable clock source:
  - Internal: LSE, LSI, HSI16 or APB clocks
  - External: over LPTIM input (working even with no internal clock source running, used by pulse counter application)
- Programmable digital glitch filter
- Encoder mode

### 3.18.5 Independent watchdog (IWDG)

The independent watchdog is based on an 8-bit prescaler and 12-bit downcounter with user-defined refresh window. It is clocked from an independent 32 kHz internal RC (LSI). Independent of the main clock, it can operate in Stop and Standby modes. It can be used either as a watchdog to reset the device when a problem occurs, or as a free-running timer for application timeout management. It is hardware- or software-configurable through the option bytes. Its counter can be frozen in debug mode.

### 3.18.6 System window watchdog (WWDG)

The window watchdog is based on a 7-bit downcounter that can be set as free-running. It can be used as a watchdog to reset the device when a problem occurs. It is clocked by the system clock. It has an early-warning interrupt capability. Its counter can be frozen in debug mode.

### 3.18.7 SysTick timer

This timer is dedicated to real-time operating systems, but it can also be used as a standard down counter.

Features of SysTick timer:

- 24-bit down counter
- Autoreload capability
- Maskable system interrupt generation when the counter reaches 0
- Programmable clock source

## 3.19 Real-time clock (RTC), tamper (TAMP) and backup registers

The device embeds an RTC and five 32-bit backup registers, located in the RTC domain of the silicon die.

The ways of powering the RTC domain are described in [Section 3.7.6](#).

The RTC is an independent BCD timer/counter.

Features of the RTC:

- Calendar with subsecond, seconds, minutes, hours (12 or 24 format), week day, date, month, year, in BCD (binary-coded decimal) format
- Automatic correction for 28, 29 (leap year), 30, and 31 days of the month
- Programmable alarm
- On-the-fly correction from 1 to 32767 RTC clock pulses, usable for synchronization with a master clock
- Reference clock detection - a more precise second-source clock (50 or 60 Hz) can be used to improve the calendar precision
- Digital calibration circuit with 0.95 ppm resolution, to compensate for quartz crystal inaccuracy
- Two anti-tamper detection pins with programmable filter
- Timestamp feature to save a calendar snapshot, triggered by an event on the timestamp pin or a tamper event, or by switching to VBAT mode
- 17-bit auto-reload wakeup timer (WUT) for periodic events, with programmable resolution and period
- Multiple clock sources and references:
  - A 32.768 kHz external crystal (LSE)
  - An external resonator or oscillator (LSE)
  - The internal low-power RC oscillator (LSI, with typical frequency of 32 kHz)
  - The high-speed external clock (HSE) divided by 32

When clocked by LSE, the RTC operates in VBAT mode and in all low-power modes. When clocked by LSI, the RTC does not operate in VBAT mode, but it does in low-power modes except for the Shutdown mode.

All RTC events (Alarm, WakeUp Timer, Timestamp or Tamper) can generate an interrupt and wake the device up from the low-power modes.

The backup registers allow keeping 20 bytes of user application data in the event of  $V_{DD}$  failure, if a valid backup supply voltage is provided on VBAT pin. They are not affected by the system reset, power reset, and upon the device's wakeup from Standby or Shutdown modes.

### 3.20 Inter-integrated circuit interface (I2C)

The device embeds three I2C peripherals. Refer to [Table 8](#) for the features.

The I<sup>2</sup>C-bus interface handles communication between the microcontroller and the serial I<sup>2</sup>C-bus. It controls all I<sup>2</sup>C-bus-specific sequencing, protocol, arbitration and timing.

Features of the I2C peripheral:

- I<sup>2</sup>C-bus specification and user manual rev. 5 compatibility:
  - Slave and master modes, multimaster capability
  - Standard-mode (Sm), with a bitrate up to 100 kbit/s
  - Fast-mode (Fm), with a bitrate up to 400 kbit/s
  - Fast-mode Plus (Fm+), with a bitrate up to 1 Mbit/s and extra output drive I/Os
  - 7-bit and 10-bit addressing mode, multiple 7-bit slave addresses
  - Programmable setup and hold times
  - Clock stretching
- SMBus specification rev 3.0 compatibility:
  - Hardware PEC (packet error checking) generation and verification with ACK control
  - Command and data acknowledge control
  - Address resolution protocol (ARP) support
  - Host and Device support
  - SMBus alert
  - Timeouts and idle condition detection
- PMBus rev 1.3 standard compatibility
- Independent clock: a choice of independent clock sources allowing the I2C communication speed to be independent of the PCLK reprogramming
- Wakeup from Stop mode on address match
- Programmable analog and digital noise filters
- 1-byte buffer with DMA capability

**Table 8. I<sup>2</sup>C implementation**

I <sup>2</sup> C features <sup>(1)</sup>	I2C1 I2C2	I2C3
Standard mode (up to 100 kbit/s)	X	X
Fast mode (up to 400 kbit/s)	X	X
Fast Mode Plus (up to 1 Mbit/s) with extra output drive I/Os	X	X
Programmable analog and digital noise filters	X	X
SMBus/PMBus hardware support	X	-
Independent clock	X	-
Wakeup from Stop mode on address match	X	-

1. X: supported

### 3.21 Universal synchronous/asynchronous receiver transmitter (USART)

The device embeds universal synchronous/asynchronous receivers/transmitters that communicate at speeds of up to 8 Mbit/s.

They provide hardware management of the CTS, RTS and RS485 DE signals, multiprocessor communication mode, master synchronous communication and single-wire half-duplex communication mode. Some can also support SmartCard communication (ISO 7816), IrDA SIR ENDEC, LIN Master/Slave capability and auto baud rate feature, and have a clock domain independent of the CPU clock, which allows them to wake up the MCU from Stop mode. The wakeup events from Stop mode are programmable and can be:

- start bit detection
- any received data frame
- a specific programmed data frame

All USART interfaces can be served by the DMA controller.

**Table 9. USART implementation**

USART modes/features <sup>(1)</sup>	USART1 USART2 USART3	USART4 USART5 USART6
Hardware flow control for modem	X	X
Continuous communication using DMA	X	X
Multiprocessor communication	X	X
Synchronous mode	X	X
Smartcard mode	X	-
Single-wire half-duplex communication	X	X
IrDA SIR ENDEC block	X	-
LIN mode	X	-
Dual clock domain and wakeup from Stop mode	X	-
Receiver timeout interrupt	X	-
Modbus communication	X	-
Auto baud rate detection	X	-
Driver Enable	X	X

1. X: supported

### 3.22 Low-power universal asynchronous receiver transmitter (LPUART)

The device embeds two LPUARTs. The peripheral supports asynchronous serial communication with minimum power consumption. It supports half duplex single wire communication and modem operations (CTS/RTS). It allows multiprocessor communication.

The LPUART has a clock domain independent of the CPU clock, and can wakeup the system from Stop mode. The Stop mode wakeup events are programmable and can be:

- start bit detection
- any received data frame
- a specific programmed data frame

Only a 32.768 kHz clock (LSE) is needed to allow LPUART communication up to 9600 baud. Therefore, even in Stop mode, the LPUART can wait for an incoming frame while having an extremely low energy consumption. Higher speed clock can be used to reach higher baudrates.

The LPUART interface can be served by the DMA controller.

### 3.23 Serial peripheral interface (SPI)

The device contains three SPIs running at up to 32 Mbits/s in master and slave modes. It supports half-duplex, full-duplex and simplex communications. A 3-bit prescaler gives eight master mode frequencies. The frame size is configurable from 4 bits to 16 bits. The SPI peripherals support NSS pulse mode, TI mode and hardware CRC calculation.

The SPI peripherals can be served by the DMA controller.

The I<sup>2</sup>S interface mode of the SPI peripheral (if supported, see the following table) supports four different audio standards can operate as master or slave, in half-duplex communication mode. It can be configured to transfer 16 and 24 or 32 bits with 16-bit or 32-bit data resolution and synchronized by a specific signal. Audio sampling frequency from 8 kHz up to 192 kHz can be set by an 8-bit programmable linear prescaler. When operating in master mode, it can output a clock for an external audio component at 256 times the sampling frequency.

Table 10. SPI/I2S implementation

SPI features <sup>(1)</sup>	SPI1 SPI2	SPI3
Hardware CRC calculation	X	X
Rx/Tx FIFO	X	X
NSS pulse mode	X	X
I <sup>2</sup> S mode	X	-
TI mode	X	X

1. X = supported.

### 3.24 Universal serial bus device (USB) and host (USBH)

The devices embed a USB controller with full-speed USB device and host functionality compliant with the USB specification version 2.0. The internal USB PHY supports USB FS signaling, embedded DP pull-up and also battery charging detection according to Battery Charging Specification Revision 1.2. The USB interface implements a full-speed (12 Mbit/s) function interface with added support for USB 2.0 Link Power Management. It has software-configurable endpoint setting with packet memory up to 1 KB and suspend/resume support. It requires a precise 48 MHz clock that is generated from the internal main PLL (the clock source must use a HSE crystal oscillator) or by the internal 48 MHz oscillator in automatic trimming mode. The synchronization for this oscillator can be taken from the USB data stream itself (SOF signalization) which allows crystal less operation.

## 3.25 USB Type-C™ Power Delivery controller

The device embeds two controllers (UCPD1 and UCPD2) compliant with USB Type-C Rev. 1.2 and USB Power Delivery Rev. 3.0 specifications.

The controllers use specific I/Os supporting the USB Type-C and USB Power Delivery requirements, featuring:

- USB Type-C pull-up ( $R_p$ , all values) and pull-down ( $R_d$ ) resistors
- “Dead battery” support
- USB Power Delivery message transmission and reception
- FRS (fast role swap) support

The digital controller handles notably:

- USB Type-C level detection with de-bounce, generating interrupts
- FRS detection, generating an interrupt
- byte-level interface for USB Power Delivery payload, generating interrupts (DMA compatible)
- USB Power Delivery timing dividers (including a clock pre-scaler)
- CRC generation/checking
- 4b5b encode/decode
- ordered sets (with a programmable ordered set mask at receive)
- frequency recovery in receiver during preamble

The interface offers low-power operation compatible with Stop mode, maintaining the capacity to detect incoming USB Power Delivery messages and FRS signaling.

## 3.26 Controller area network (FDCAN)

The controller area network (CAN) subsystem consists of two CAN modules and a message RAM.

The CAN modules are compliant with ISO 11898-1 (CAN protocol specification version 2.0 part A, B) and CAN FD protocol specification version 1.0.

The 1-Kbyte message RAM per CAN module implements filters, receive FIFOs, receive buffers, transmit event FIFOs, and transmit buffers.

## 3.27 Development support

### 3.27.1 Serial wire debug port (SW-DP)

An Arm SW-DP interface is provided to allow a serial wire debugging tool to be connected to the MCU.

# 4 Pinouts, pin description and alternate functions

The devices housed in 32-pin, 48-pin, and 64-pin packages come in two variants - “GP” and “N” (the latter with ordering code having N behind the temperature range digit). Refer to [Table 2: Features and peripheral counts](#) for differences.

- PC13, PC14 and PC15 are supplied through the power switch. Since the switch only sinks a limited amount of current (3 mA), the mode is limited:
  - The speed should not exceed 2 MHz with a maximum load of 30 pF
  - These GPIOs must not be used as current sources (for example to drive a LED).
- After an RTC domain power-up, PC13, PC14 and PC15 operate as GPIOs. Their function then depends on the content of the RTC reset upon system reset. For details on how to manage these GPIOs, refer to the RTC domain and RTC register descriptions in the
- Upon reset, a pull down resistor might be present on PB15, PA8, PD0 or PD2 depending on voltage level PB0 PA9 PC6 PA10 PD1 strobe the UCPDx\_STROBE bit in SYSCFG\_CFGR1 register during start-up sequence.
- Pins PA9/PA10 can be remapped in place of pins PA11/PA12 (default mapping), using SYSCFG\_CFGR1 register.
- Upon reset, these pins are configured as SW debug alternate functions, and the internal pull-up on PA13 pin and the internal pull-d

## 5 Electrical characteristics

### 5.1 Parameter conditions

Unless otherwise specified, all voltages are referenced to  $V_{SS}$ .

Parameter values defined at temperatures or in temperature ranges out of the ordering information scope are to be ignored.

Packages used for characterizing certain electrical parameters may differ from the commercial packages as per the ordering information.

#### 5.1.1 Minimum and maximum values

Unless otherwise specified, the minimum and maximum values are guaranteed in the worst conditions of ambient temperature, supply voltage and frequencies by tests in production on 100% of the devices with an ambient temperature at  $T_A = 25\text{ °C}$  and  $T_A = T_A(\text{max})$  (given by the selected temperature range).

Data based on characterization results, design simulation and/or technology characteristics are indicated in the table footnotes and are not tested in production. Based on characterization, the minimum and maximum values refer to sample tests and represent the mean value plus or minus three times the standard deviation (mean  $\pm 3\sigma$ ).

#### 5.1.2 Typical values

Unless otherwise specified, typical data are based on  $T_A = 25\text{ °C}$ ,  $V_{DD} = V_{DDA} = V_{DDIO2} = 3\text{ V}$ . They are given only as design guidelines and are not tested.

Typical ADC accuracy values are determined by characterization of a batch of samples from a standard diffusion lot over the full temperature range, where 95% of the devices have an error less than or equal to the value indicated (mean  $\pm 2\sigma$ ).

#### 5.1.3 Typical curves

Unless otherwise specified, all typical curves are given only as design guidelines and are not tested.

#### 5.1.4 Loading capacitor

The loading conditions used for pin parameter measurement are shown in [Figure 13](#).

#### 5.1.5 Pin input voltage

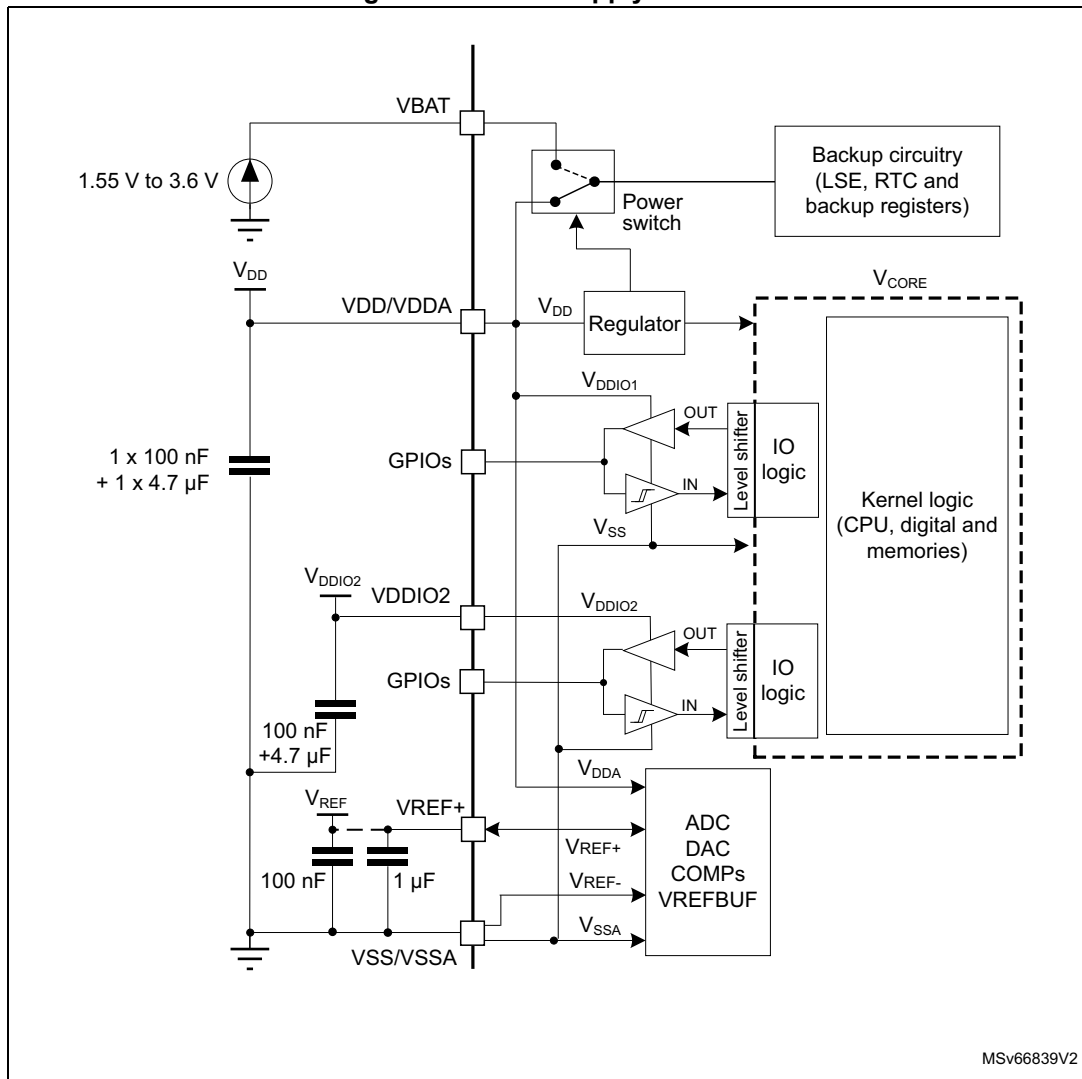

The input voltage measurement on a pin of the device is described in [Figure 14](#).

5.1.6 Power supply scheme

Figure 15. Power supply scheme

**Caution:** Power supply pin pair (VDD/VDDA/VDDIO2 and VSS/VSSA) must be decoupled with filtering ceramic capacitors as shown above. These capacitors must be placed as close as possible to, or below, the appropriate pins on the underside of the PCB to ensure the good functionality of the device.

### 5.1.7 Current consumption measurement

Figure 16. Current consumption measurement scheme

## 5.2 Absolute maximum ratings

Stresses above the absolute maximum ratings listed in [Table 21](#), [Table 22](#) and [Table 23](#) may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these conditions is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

All voltages are defined with respect to  $V_{SS}$ .

Table 21. Voltage characteristics

Symbol	Ratings	Min	Max	Unit
$V_{DD}$	External supply voltage	- 0.3	4.0	V
$V_{DDIO2}$	External supply voltage for selected I/Os	- 0.3	4.0	
$V_{BAT}$	External supply voltage on VBAT pin	- 0.3	4.0	
$V_{REF+}$	External voltage on VREF+ pin	- 0.3	$\text{Min}(V_{DD} + 0.4, 4.0)$	
$V_{IN}^{(1)}$	Input voltage on FT_xx pins except FT_c	- 0.3	$V_{DD} + 4.0^{(2)}$	
	Input voltage on FT_c pins	- 0.3	5.5	
	Input voltage on any other pin	- 0.3	4.0	

1. Refer to [Table 22](#) for the maximum allowed injected current values.
2. To sustain a voltage higher than 4 V the internal pull-up/pull-down resistors must be disabled.

**Table 22. Current characteristics**

Symbol	Ratings	Max	Unit
$I_{VDD/VDDA/VDDIO2}$	Current into VDD/VDDA/VDDIO2 power pin (source) <sup>(1)</sup>	100	mA
$I_{VSS/VSSA}$	Current out of VSS/VSSA ground pin (sink) <sup>(1)</sup>	100	
$I_{IO(PIN)}$	Output current sunk by any I/O and control pin except FT_f	15	
	Output current sunk by any FT_f pin	20	
	Output current sourced by any I/O and control pin	15	
$\sum I_{IO(PIN)}$	Total output current sunk by sum of all I/Os and control pins	80	
	Total output current sourced by sum of all I/Os and control pins	80	
$I_{INJ(PIN)}^{(2)}$	Injected current on a FT_xx pin	-5 / NA <sup>(3)</sup>	
	Injected current on a TT_a pin <sup>(4)</sup>	-5 / 0	
$\sum  I_{INJ(PIN)} $	Total injected current (sum of all I/Os and control pins) <sup>(5)</sup>	25	

1. All main power (VDD/VDDA/VDDIO2, VBAT) and ground (VSS/VSSA) pins must always be connected to the external power supplies, in the permitted range.
2. A positive injection is induced by  $V_{IN} > V_{DDIOx}$  while a negative injection is induced by  $V_{IN} < V_{SS}$ .  $I_{INJ(PIN)}$  must never be exceeded. Refer also to [Table 21: Voltage characteristics](#) for the maximum allowed input voltage values.
3. Positive injection is not possible on these I/Os and does not occur for input voltages lower than the specified maximum value.
4. On these I/Os, any current injection disturbs the analog performances of the device.
5. When several inputs are submitted to a current injection, the maximum  $\sum |I_{INJ(PIN)}|$  is the absolute sum of the negative injected currents (instantaneous values).

**Table 23. Thermal characteristics**

Symbol	Ratings	Value	Unit
$T_{STG}$	Storage temperature range	-65 to +150	°C
$T_J$	Maximum junction temperature	150	°C

## 5.3 Operating conditions

### 5.3.1 General operating conditions

**Table 24. General operating conditions**

Symbol	Parameter	Conditions	Min	Max	Unit
$f_{HCLK}$	Internal AHB clock frequency	-	0	64	MHz
$f_{PCLK}$	Internal APB clock frequency	-	0	64	
$V_{DD}$	Standard operating voltage	-	1.7 <sup>(1)</sup>	3.6	V
$V_{DDIO2}$	External supply voltage for selected I/Os	-	1.7	3.6	V

**Table 24. General operating conditions (continued)**

Symbol	Parameter	Conditions	Min	Max	Unit
V <sub>DDA</sub>	Analog supply voltage	For ADC and COMP operation	1.62	3.6	V
		For DAC operation	1.8	3.6	
		For VREFBUF operation	2.4	3.6	
V <sub>BAT</sub>	Backup operating voltage	-	1.55	3.6	V
V <sub>IN</sub>	I/O input voltage	All except TT_xx and FT_c	-0.3	Min(V <sub>DD</sub> + 3.6, 5.5) <sup>(2)</sup>	V
		TT_xx	-0.3	V <sub>DD</sub> + 0.3	
		FT_c	-0.3	5.0 <sup>(2)</sup>	
T <sub>A</sub>	Ambient temperature <sup>(3)</sup>	Suffix 6 <sup>(4)</sup>	-40	85	°C
		Suffix 7 <sup>(4)</sup>	-40	105	
		Suffix 3 <sup>(4)</sup>	-40	125	
T <sub>J</sub>	Junction temperature	Suffix 6 <sup>(4)</sup>	-40	105	°C
		Suffix 7 <sup>(4)</sup>	-40	125	
		Suffix 3 <sup>(4)</sup>	-40	130	

1. When RESET is released functionality is guaranteed down to V<sub>PDR</sub> min.
2. For operation with voltage higher than V<sub>DD</sub> +0.3 V, the internal pull-up and pull-down resistors must be disabled.
3. The T<sub>A</sub>(max) applies to P<sub>D</sub>(max). At P<sub>D</sub> < P<sub>D</sub>(max) the ambient temperature is allowed to go higher than T<sub>A</sub>(max) provided that the junction temperature T<sub>J</sub> does not exceed T<sub>J</sub>(max). Refer to [Section 6.11: Thermal characteristics](#).
4. Temperature range digit in the order code. See [Section 7: Ordering information](#).

### 5.3.2 Operating conditions at power-up / power-down

The parameters given in [Table 25](#) are derived from tests performed under the ambient temperature condition summarized in [Table 24](#).

**Table 25. Operating conditions at power-up / power-down**

Symbol	Parameter	Conditions	Min	Max	Unit
t <sub>VDD</sub>	V <sub>DD</sub> slew rate	V <sub>DD</sub> rising	-	∞	µs/V
		V <sub>DD</sub> falling; ULPEN = 0	10	∞	
		V <sub>DD</sub> falling; ULPEN = 1	100	∞	ms/V

### 5.3.3 Embedded reset and power control block characteristics

The parameters given in [Table 26](#) are derived from tests performed under the ambient temperature conditions summarized in [Table 24: General operating conditions](#).

**Table 26. Embedded reset and power control block characteristics**

Symbol	Parameter	Conditions <sup>(1)</sup>	Min	Typ	Max	Unit
t <sub>RSTTEMPO</sub> <sup>(2)</sup>	POR temporization when V <sub>DD</sub> crosses V <sub>POR</sub>	V <sub>DD</sub> rising	-	250	400	µs
V <sub>POR</sub> <sup>(2)</sup>	Power-on reset threshold	-	1.62	1.66	1.70	V

Table 26. Embedded reset and power control block characteristics (continued)

Symbol	Parameter	Conditions <sup>(1)</sup>	Min	Typ	Max	Unit
$V_{PDR}^{(2)}$	Power-down reset threshold	-	1.60	1.64	1.69	V
$V_{BOR1}$	Brownout reset threshold 1	$V_{DD}$ rising	2.05	2.10	2.18	V
		$V_{DD}$ falling	1.95	2.00	2.08	
$V_{BOR2}$	Brownout reset threshold 2	$V_{DD}$ rising	2.20	2.31	2.38	V
		$V_{DD}$ falling	2.10	2.21	2.28	
$V_{BOR3}$	Brownout reset threshold 3	$V_{DD}$ rising	2.50	2.62	2.68	V
		$V_{DD}$ falling	2.40	2.52	2.58	
$V_{BOR4}$	Brownout reset threshold 4	$V_{DD}$ rising	2.80	2.91	3.00	V
		$V_{DD}$ falling	2.70	2.81	2.90	
$V_{PVD0}$	Programmable voltage detector threshold 0	$V_{DD}$ rising	2.05	2.15	2.22	V
		$V_{DD}$ falling	1.95	2.05	2.12	
$V_{PVD1}$	PVD threshold 1	$V_{DD}$ rising	2.20	2.30	2.37	V
		$V_{DD}$ falling	2.10	2.20	2.27	
$V_{PVD2}$	PVD threshold 2	$V_{DD}$ rising	2.35	2.46	2.54	V
		$V_{DD}$ falling	2.25	2.36	2.44	
$V_{PVD3}$	PVD threshold 3	$V_{DD}$ rising	2.50	2.62	2.70	V
		$V_{DD}$ falling	2.40	2.52	2.60	
$V_{PVD4}$	PVD threshold 4	$V_{DD}$ rising	2.65	2.74	2.87	V
		$V_{DD}$ falling	2.55	2.64	2.77	
$V_{PVD5}$	PVD threshold 5	$V_{DD}$ rising	2.80	2.91	3.03	V
		$V_{DD}$ falling	2.70	2.81	2.93	
$V_{PVD6}$	PVD threshold 6	$V_{DD}$ rising	2.90	3.01	3.14	V
		$V_{DD}$ falling	2.80	2.91	3.04	
$V_{hyst\_POR\_PDR}$	Hysteresis of $V_{POR}$ and $V_{PDR}$	Hysteresis in continuous mode	-	20	-	mV
		Hysteresis in other mode	-	30	-	
$V_{hyst\_BOR\_PVD}$	Hysteresis of $V_{BORx}$ and $V_{PVDx}$	-	-	100	-	mV
$I_{DD(BOR\_PVD)}^{(2)}$	BOR and PVD consumption	-	-	1.1	1.6	$\mu$ A

1. Continuous mode means Run/Sleep modes, or temperature sensor enable in Low-power run/Low-power sleep modes.

2. Guaranteed by design.

### 5.3.4 Embedded voltage reference

The parameters given in [Table 27](#) are derived from tests performed under the ambient temperature and supply voltage conditions summarized in [Table 24: General operating conditions](#).

**Table 27. Embedded internal voltage reference**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$V_{REFINT}$	Internal reference voltage	$-40^{\circ}\text{C} < T_J < 130^{\circ}\text{C}$	1.182	1.212	1.232	V
$t_{S\_vrefint}^{(1)}$	ADC sampling time when reading the internal reference voltage	-	4 <sup>(2)</sup>	-	-	$\mu\text{s}$
$t_{start\_vrefint}$	Start time of reference voltage buffer when ADC is enable	-	-	8	12 <sup>(2)</sup>	$\mu\text{s}$
$I_{DD(VREFINTBUF)}$	$V_{REFINT}$ buffer consumption from $V_{DD}$ when converted by ADC	-	-	12.5	20 <sup>(2)</sup>	$\mu\text{A}$
$\Delta V_{REFINT}$	Internal reference voltage spread over the temperature range	$V_{DD} = 3\text{ V}$	-	5	7.5 <sup>(2)</sup>	mV
$T_{Coef\_vrefint}$	Temperature coefficient	-	-	30	50 <sup>(2)</sup>	ppm/ $^{\circ}\text{C}$
$A_{Coef}$	Long term stability	1000 hours, $T = 25^{\circ}\text{C}$	-	300	1000 <sup>(2)</sup>	ppm
$V_{DDCoef}$	Voltage coefficient	$3.0\text{ V} < V_{DD} < 3.6\text{ V}$	-	250	1200 <sup>(2)</sup>	ppm/V
$V_{REFINT\_DIV1}$	1/4 reference voltage	-	24	25	26	% $V_{REFINT}$
$V_{REFINT\_DIV2}$	1/2 reference voltage		49	50	51	
$V_{REFINT\_DIV3}$	3/4 reference voltage		74	75	76	

1. The shortest sampling time can be determined in the application by multiple iterations.
2. Guaranteed by design.

**Figure 17.  $V_{REFINT}$  vs. temperature**

### 5.3.5 Supply current characteristics

The current consumption is a function of several parameters and factors such as the operating voltage, ambient temperature, I/O pin loading, device software configuration, operating frequencies, I/O pin switching rate, program location in memory and executed binary code.

The current consumption is measured as described in [Figure 16: Current consumption measurement scheme](#).

#### Typical and maximum current consumption

The MCU is placed under the following conditions:

- All I/O pins are in analog input mode
- All peripherals are disabled except when explicitly mentioned
- The Flash memory access time is adjusted with the minimum wait states number, depending on the  $f_{HCLK}$  frequency (refer to the table “Number of wait states according to CPU clock (HCLK) frequency” available in the RM0444 reference manual).
- When the peripherals are enabled  $f_{PCLK} = f_{HCLK}$
- For Flash memory and shared peripherals  $f_{PCLK} = f_{HCLK} = f_{HCLKS}$

Unless otherwise stated, values given in [Table 28](#) through [Table 36](#) are derived from tests performed under ambient temperature and supply voltage conditions summarized in [Table 24: General operating conditions](#).

**Table 28. Current consumption in Run and Low-power run modes at different die temperatures**

Symbol	Parameter	Conditions			Typ			Max <sup>(1)</sup>			Unit
		General	f <sub>HCLK</sub>	Fetch from <sup>(2)</sup>	25 °C	85 °C	125 °C	25 °C	85 °C	130 °C	
I <sub>DD(Run)</sub>	Supply current in Run mode (from Flash memory)	Range 1; PLL enabled; f <sub>HCLK</sub> = f <sub>HSE_bypass</sub> (≤16 MHz), f <sub>HCLK</sub> = f <sub>PLLCLK</sub> (>16 MHz); <sup>(3)</sup>	64 MHz	Flash memory	8.6	8.8	9.4	9.0	9.1	9.7	mA

### I/O system current consumption

The current consumption of the I/O system has two components: static and dynamic.

#### I/O static current consumption

All the I/Os used as inputs with pull-up generate current consumption when the pin is externally held low. The value of this current consumption can be simply computed by using the pull-up/pull-down resistors values given in [Table 55: I/O static characteristics](#).

For the output pins, any external pull-down or external load must also be considered to estimate the current consumption.

Additional I/O current consumption is due to I/Os configured as inputs if an intermediate voltage level is externally applied. This current consumption is caused by the input Schmitt trigger circuits used to discriminate the input value. Unless this specific configuration is required by the application, this supply current consumption can be avoided by configuring these I/Os in analog mode. This is notably the case of ADC input pins which should be configured as analog inputs.

**Caution:** Any floating input pin can also settle to an intermediate voltage level or switch inadvertently, as a result of external electromagnetic noise. To avoid current consumption related to floating pins, they must either be configured in analog mode, or forced internally to a definite digital value. This can be done either by using pull-up/down resistors or by configuring the pins in output mode.

#### I/O dynamic current consumption

In addition to the internal peripheral current consumption measured previously (see [Table 36: Current consumption of peripherals](#)), the I/Os used by an application also contribute to the current consumption. When an I/O pin switches, it uses the current from the I/O supply voltage to supply the I/O pin circuitry and to charge/discharge the capacitive load (internal or external) connected to the pin:

$$I_{SW} = V_{DDIOx} \times f_{SW} \times C$$

where

$I_{SW}$  is the current sunk by a switching I/O to charge/discharge the capacitive load

$V_{DDIOx}$  is the I/O supply voltage

$f_{SW}$  is the I/O switching frequency

$C$  is the total capacitance seen by the I/O pin:  $C = C_{INT} + C_{EXT} + C_S$

$C_S$  is the PCB board capacitance including the pad pin.

The test pin is configured in push-pull output mode and is toggled by software at a fixed frequency.

### On-chip peripheral current consumption

The current consumption of the on-chip peripherals is given in the following table. The MCU is placed under the following conditions:

- All I/O pins are in Analog mode
- The given value is calculated by measuring the difference of the current consumptions:
  - when the peripheral is clocked on
  - when the peripheral is clocked off
- Ambient operating temperature and supply voltage conditions summarized in [Table 21: Voltage characteristics](#)
- The power consumption of the digital part of the on-chip peripherals is given in the following table. The power consumption of the analog part of the peripherals (where applicable) is indicated in each related section of the datasheet.

**Table 36. Current consumption of peripherals**

Peripheral	Bus	Consumption in $\mu\text{A}/\text{MHz}$		
		Range 1	Range 2	Low-power run and sleep
IOPORT Bus	IOPORT	0.5	0.4	0.3
GPIOA	IOPORT	3.1	2.4	3.0

1. The AHB to APB Bridge is automatically active when at least one peripheral is ON on the APB.

2. UCPDx are always clocked by HSI16.

### 5.3.6 Wakeup time from low-power modes and voltage scaling transition times

The wakeup times given in [Table 37](#) are the latency between the event and the execution of the first user instruction.

**Table 37. Low-power mode wakeup times<sup>(1)</sup>**

Symbol	Parameter	Conditions	Typ	Max	Unit
t <sub>WUSLEEP</sub>	Wakeup time from Sleep to Run mode	-	11	11	CPU cycles
t <sub>WULPSLEEP</sub>	Wakeup time from Low-power sleep mode	Transiting to Low-power-run-mode execution in Flash memory not powered in Low-power sleep mode; HCLK = HSI16 / 8 = 2 MHz	11	14	
t <sub>WUSTOP0</sub>	Wakeup time from Stop 0	Transiting to Run-mode execution in Flash memory not powered in Stop 0 mode; HCLK = HSI16 = 16 MHz; Regulator in Range 1 or Range 2	5.6	6	µs
		Transiting to Run-mode execution in SRAM or in Flash memory powered in Stop 0 mode; HCLK = HSI16 = 16 MHz; Regulator in Range 1 or Range 2	2	2.4	
t <sub>WUSTOP1</sub>	Wakeup time from Stop 1	Transiting to Run-mode execution in Flash memory not powered in Stop 1 mode; HCLK = HSI16 = 16 MHz; Regulator in Range 1 or Range 2	9.0	11.2	µs
		Transiting to Run-mode execution in SRAM or in Flash memory powered in Stop 1 mode; HCLK = HSI16 = 16 MHz; Regulator in Range 1 or Range 2	5	7.5	
		Transiting to Low-power-run-mode execution in Flash memory not powered in Stop 1 mode; HCLK = HSI16/8 = 2 MHz; Regulator in low-power mode (LPR = 1 in PWR_CR1)	22	25.3	
		Transiting to Low-power-run-mode execution in SRAM or in Flash memory powered in Stop 1 mode; HCLK = HSI16 / 8 = 2 MHz; Regulator in low-power mode (LPR = 1 in PWR_CR1)	18	23.5	
t <sub>WUSTBY</sub>	Wakeup time from Standby mode	Transiting to Run mode; HCLK = HSI16 = 16 MHz; Regulator in Range 1	14.5	30	µs

**Table 37. Low-power mode wakeup times<sup>(1)</sup> (continued)**

Symbol	Parameter	Conditions	Typ	Max	Unit
t <sub>WUSHDN</sub>	Wakeup time from Shutdown mode	Transiting to Run mode; HCLK = HSI16 = 16 MHz; Regulator in Range 1	258	340	μs
t <sub>WULPRUN</sub>	Wakeup time from Low-power run mode <sup>(2)</sup>	Transiting to Run mode; HSISYS = HSI16/8 = 2 MHz	5	7	μs

1. Based on characterization results, not tested in production.
2. Time until REGLPF flag is cleared in PWR\_SR2.

**Table 38. Regulator mode transition times<sup>(1)</sup>**

Symbol	Parameter	Conditions	Typ	Max	Unit
t <sub>VOST</sub>	Transition times between regulator Range 1 and Range 2 <sup>(2)</sup>	HSISYS = HSI16	20	40	μs

1. Based on characterization results, not tested in production.
2. Time until VOSF flag is cleared in PWR\_SR2.

**Table 39. Wakeup time using LPUART<sup>(1)</sup>**

Symbol	Parameter	Conditions	Typ	Max	Unit
t <sub>WULPUART</sub>	Wakeup time needed to calculate the maximum LPUART baud rate allowing to wakeup up from Stop mode when LPUART clock source is HSI16	Stop mode 0	-	1.7	μs
		Stop mode 1	-	8.5	

1. Guaranteed by design.

### 5.3.7 External clock source characteristics

#### High-speed external user clock generated from an external source

In bypass mode the HSE oscillator is switched off and the input pin is a standard GPIO.

The external clock signal has to respect the I/O characteristics in [Section 5.3.14](#). See [Figure 18](#) for recommended clock input waveform.

**Table 40. High-speed external user clock characteristics<sup>(1)</sup>**

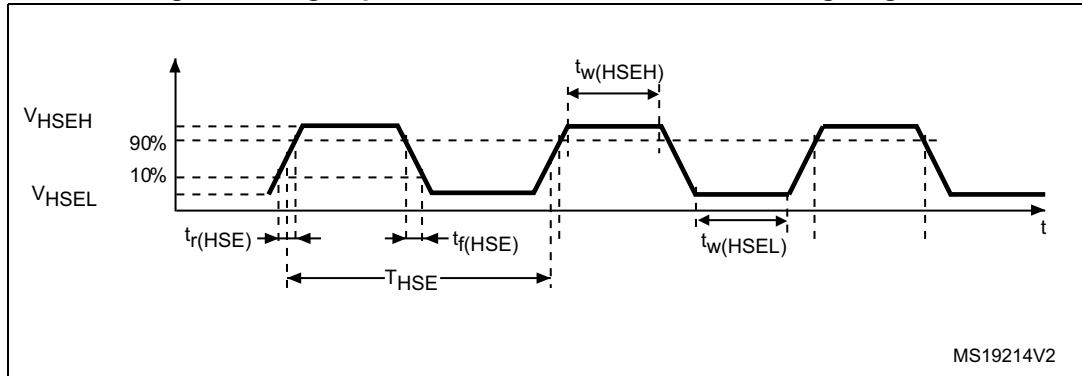

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
f <sub>HSE_ext</sub>	User external clock source frequency	Voltage scaling Range 1	-	8	48	MHz
		Voltage scaling Range 2	-	8	26	
V <sub>HSEH</sub>	OSC_IN input pin high level voltage	-	0.7 V <sub>DDIO1</sub>	-	V <sub>DDIO1</sub>	V
V <sub>HSEL</sub>	OSC_IN input pin low level voltage	-	V <sub>SS</sub>	-	0.3 V <sub>DDIO1</sub>	

**Table 40. High-speed external user clock characteristics<sup>(1)</sup> (continued)**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$t_{w(HSEH)}$ $t_{w(HSEL)}$	OSC_IN high or low time	Voltage scaling Range 1	7	-	-	ns
		Voltage scaling Range 2	18	-	-	

1. Guaranteed by design.

**Figure 18. High-speed external clock source AC timing diagram**

**Low-speed external user clock generated from an external source**

In bypass mode the LSE oscillator is switched off and the input pin is a standard GPIO.

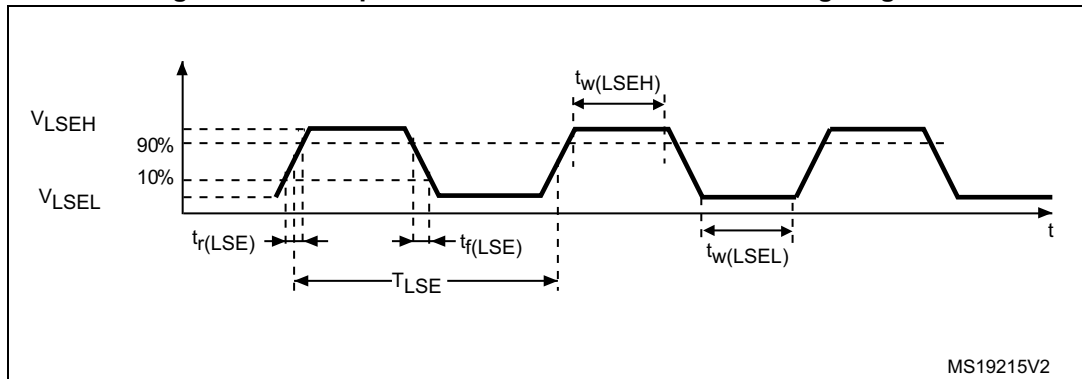

The external clock signal has to respect the I/O characteristics in [Section 5.3.14](#). See [Figure 19](#) for recommended clock input waveform.

**Table 41. Low-speed external user clock characteristics<sup>(1)</sup>**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$f_{LSE\_ext}$	User external clock source frequency	-	-	32.768	1000	kHz
$V_{LSEH}$	OSC32_IN input pin high level voltage	-	$0.7 V_{DDIO1}$	-	$V_{DDIO1}$	V
$V_{LSEL}$	OSC32_IN input pin low level voltage	-	$V_{SS}$	-	$0.3 V_{DDIO1}$	
$t_{w(LSEH)}$ $t_{w(LSEL)}$	OSC32_IN high or low time	-	250	-	-	ns

1. Guaranteed by design.

Figure 19. Low-speed external clock source AC timing diagram

**High-speed external clock generated from a crystal/ceramic resonator**

The high-speed external (HSE) clock can be supplied with a 4 to 48 MHz crystal/ceramic resonator oscillator. All the information given in this paragraph are based on design simulation results obtained with typical external components specified in Table 42. In the application, the resonator and the load capacitors have to be placed as close as possible to the oscillator pins in order to minimize output distortion and startup stabilization time. Refer to the crystal resonator manufacturer for more details on the resonator characteristics (frequency, package, accuracy).

Table 42. HSE oscillator characteristics<sup>(1)</sup>

Symbol	Parameter	Conditions <sup>(2)</sup>	Min	Typ	Max	Unit
$f_{OSC\_IN}$	Oscillator frequency	-	4	8	48	MHz
$R_F$	Feedback resistor	-	-	200	-	k $\Omega$
$I_{DD(HSE)}$	HSE current consumption	During startup <sup>(3)</sup>	-	-	5.5	mA
		$V_{DD} = 3\text{ V}$ , $R_m = 30\ \Omega$ , $CL = 10\text{ pF}@8\text{ MHz}$	-	0.44	-	
		$V_{DD} = 3\text{ V}$ , $R_m = 45\ \Omega$ , $CL = 10\text{ pF}@8\text{ MHz}$	-	0.45	-	
		$V_{DD} = 3\text{ V}$ , $R_m = 30\ \Omega$ , $CL = 5\text{ pF}@48\text{ MHz}$	-	0.68	-	
		$V_{DD} = 3\text{ V}$ , $R_m = 30\ \Omega$ , $CL = 10\text{ pF}@48\text{ MHz}$	-	0.94	-	
$G_m$	Maximum critical crystal transconductance	Startup	-	-	1.5	mA/V
		$t_{SU(HSE)}$ <sup>(4)</sup>	Startup time	$V_{DD}$ is stabilized	-	2

1. Guaranteed by design.

2. Resonator characteristics given by the crystal/ceramic resonator manufacturer.

3. This consumption level occurs during the first 2/3 of the  $t_{SU(HSE)}$  startup time
4.  $t_{SU(HSE)}$  is the startup time measured from the moment it is enabled (by software) to a stabilized 8 MHz oscillation is reached. This value is measured for a standard crystal resonator and it can vary significantly with the crystal manufacturer

For  $C_{L1}$  and  $C_{L2}$ , it is recommended to use high-quality external ceramic capacitors in the 5 pF to 20 pF range (typ.), designed for high-frequency applications, and selected to match the requirements of the crystal or resonator (see [Figure 20](#)).  $C_{L1}$  and  $C_{L2}$  are usually the same size. The crystal manufacturer typically specifies a load capacitance which is the series combination of  $C_{L1}$  and  $C_{L2}$ . PCB and MCU pin capacitance must be included (10 pF can be used as a rough estimate of the combined pin and board capacitance) when sizing  $C_{L1}$  and  $C_{L2}$ .

*Note:* For information on selecting the crystal, refer to the application note AN2867 “Oscillator design guide for ST microcontrollers” available from the ST website [www.st.com](http://www.st.com).

**Figure 20. Typical application with an 8 MHz crystal**

1.  $R_{EXT}$  value depends on the crystal characteristics.

### Low-speed external clock generated from a crystal resonator

The low-speed external (LSE) clock can be supplied with a 32.768 kHz crystal resonator oscillator. All the information given in this paragraph are based on design simulation results obtained with typical external components specified in [Table 43](#). In the application, the resonator and the load capacitors have to be placed as close as possible to the oscillator pins in order to minimize output distortion and startup stabilization time. Refer to the crystal resonator manufacturer for more details on the resonator characteristics (frequency, package, accuracy).

Table 43. LSE oscillator characteristics ( $f_{LSE} = 32.768 \text{ kHz}$ )<sup>(1)</sup>

Symbol	Parameter	Conditions <sup>(2)</sup>	Min	Typ	Max	Unit
$I_{DD(LSE)}$	LSE current consumption	LSEDRV[1:0] = 00 Low drive capability	-	250	-	nA
		LSEDRV[1:0] = 01 Medium low drive capability	-	315	-	
		LSEDRV[1:0] = 10 Medium high drive capability	-	500	-	
		LSEDRV[1:0] = 11 High drive capability	-	630	-	
$G_{m_{critmax}}$	Maximum critical crystal gm	LSEDRV[1:0] = 00 Low drive capability	-	-	0.5	$\mu A/V$
		LSEDRV[1:0] = 01 Medium low drive capability	-	-	0.75	
		LSEDRV[1:0] = 10 Medium high drive capability	-	-	1.7	
		LSEDRV[1:0] = 11 High drive capability	-	-	2.7	
$t_{SU(LSE)}$ <sup>(3)</sup>	Startup time	$V_{DD}$ is stabilized	-	2	-	s

1. Guaranteed by design.
2. Refer to the note and caution paragraphs below the table, and to the application note AN2867 “Oscillator design guide for ST microcontrollers”.
3.  $t_{SU(LSE)}$  is the startup time measured from the moment it is enabled (by software) to a stabilized 32.768 kHz oscillation is reached. This value is measured for a standard crystal and it can vary significantly with the crystal manufacturer

Note: For information on selecting the crystal, refer to the application note AN2867 “Oscillator design guide for ST microcontrollers” available from the ST website [www.st.com](http://www.st.com).

Figure 21. Typical application with a 32.768 kHz crystal

Note: An external resistor is not required between OSC32\_IN and OSC32\_OUT and it is forbidden to add one.

### 5.3.8 Internal clock source characteristics

The parameters given in [Table 44](#) are derived from tests performed under ambient temperature and supply voltage conditions summarized in [Table 24: General operating conditions](#). The provided curves are characterization results, not tested in production.

#### High-speed internal (HSI16) RC oscillator

**Table 44. HSI16 oscillator characteristics<sup>(1)</sup>**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$f_{\text{HSI16}}$	HSI16 Frequency	$V_{\text{DD}}=3.0\text{ V}$ , $T_{\text{A}}=30\text{ °C}$	15.88	-	16.08	MHz
$\Delta_{\text{Temp}}(\text{HSI16})$	HSI16 oscillator frequency drift over temperature	$T_{\text{A}}= 0\text{ to }85\text{ °C}$	-1	-	1	%
		$T_{\text{A}}= -40\text{ to }125\text{ °C}$	-2	-	1.5	%
$\Delta_{\text{VDD}}(\text{HSI16})$	HSI16 oscillator frequency drift over $V_{\text{DD}}$	$V_{\text{DD}}=1.62\text{ V to }3.6\text{ V}$	-0.1	-	0.05	%
TRIM	HSI16 frequency user trimming step	From code 127 to 128	-8	-6	-4	%
		From code 63 to 64 From code 191 to 192	-5.8	-3.8	-1.8	
		For all other code increments	0.2	0.3	0.4	
$D_{\text{HSI16}}^{(2)}$	Duty Cycle	-	45	-	55	%
$t_{\text{su}}(\text{HSI16})^{(2)}$	HSI16 oscillator start-up time	-	-	0.8	1.2	$\mu\text{s}$
$t_{\text{stab}}(\text{HSI16})^{(2)}$	HSI16 oscillator stabilization time	-	-	3	5	$\mu\text{s}$
$I_{\text{DD}}(\text{HSI16})^{(2)}$	HSI16 oscillator power consumption	-	-	155	190	$\mu\text{A}$

1. Based on characterization results, not tested in production.
2. Guaranteed by design.

Figure 22. HSI16 frequency vs. temperature

High-speed internal 48 MHz (HSI48) RC oscillator

Table 45. HSI48 oscillator characteristics<sup>(1)</sup>

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$f_{HSI48}$	HSI48 Frequency	$V_{DD}=3.0V, T_A=30^{\circ}C$	-	48	-	MHz
TRIM	HSI48 user trimming step	-	-	0.11 <sup>(2)</sup>	0.18 <sup>(2)</sup>	%
USER TRIM COVERAGE	HSI48 user trimming coverage	$\pm 64$ steps	$\pm 6$ <sup>(3)</sup>	$\pm 7$ <sup>(3)</sup>	-	%
DuCy(HSI48)	Duty Cycle	-	45 <sup>(2)</sup>	-	55 <sup>(2)</sup>	%
$ACC_{HSI48\_REL}$	Accuracy of the HSI48 oscillator over temperature (factory calibrated)	$V_{DD} = 3.0 V$ to $3.6 V$ , $T_A = -15$ to $85^{\circ}C$	-	-	$\pm 3$ <sup>(3)</sup>	%
		$V_{DD} = 1.65 V$ to $3.6 V$ , $T_A = -40$ to $125^{\circ}C$	-	-	$\pm 4.5$ <sup>(3)</sup>	
$D_{VDD}(HSI48)$	HSI48 oscillator frequency drift with $V_{DD}$	$V_{DD} = 3 V$ to $3.6 V$	-	0.025 <sup>(3)</sup>	0.05 <sup>(3)</sup>	%
		$V_{DD} = 1.65 V$ to $3.6 V$	-	0.05 <sup>(3)</sup>	0.1 <sup>(3)</sup>	
$t_{su}(HSI48)$	HSI48 oscillator start-up time	-	-	2.5 <sup>(2)</sup>	6 <sup>(2)</sup>	$\mu s$
$I_{DD}(HSI48)$	HSI48 oscillator power consumption	-	-	340 <sup>(2)</sup>	380 <sup>(2)</sup>	$\mu A$
$N_T$ jitter	Next transition jitter Accumulated jitter on 28 cycles <sup>(4)</sup>	-	-	$\pm 0.15$ <sup>(2)</sup>	-	ns
$P_T$ jitter	Paired transition jitter Accumulated jitter on 56 cycles <sup>(4)</sup>	-	-	$\pm 0.25$ <sup>(2)</sup>	-	ns

1.  $V_{DD} = 3\text{ V}$ ,  $T_A = -40$  to  $125^\circ\text{C}$  unless otherwise specified.
2. Guaranteed by design.
3. Guaranteed by characterization results.
4. Jitter measurement are performed without clock source activated in parallel.

Figure 23. HSI48 frequency versus temperature

Low-speed internal (LSI) RC oscillator

Table 46. LSI oscillator characteristics<sup>(1)</sup>

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$f_{LSI}$	LSI frequency	$V_{DD} = 3.0\text{ V}$ , $T_A = 30^\circ\text{C}$	31.04	-	32.96	kHz
		$V_{DD} = 1.62\text{ V to }3.6\text{ V}$ , $T_A = -40$ to $125^\circ\text{C}$	29.5	-	34	
$t_{SU(LSI)}^{(2)}$	LSI oscillator start-up time	-	-	80	130	$\mu\text{s}$
$t_{STAB(LSI)}^{(2)}$	LSI oscillator stabilization time	5% of final frequency	-	125	180	$\mu\text{s}$
$I_{DD(LSI)}^{(2)}$	LSI oscillator power consumption	-	-	110	180	nA

1. Based on characterization results, not tested in production.
2. Guaranteed by design.

### 5.3.9 PLL characteristics

The parameters given in [Table 47](#) are derived from tests performed under temperature and  $V_{DD}$  supply voltage conditions summarized in [Table 24: General operating conditions](#).

**Table 47. PLL characteristics<sup>(1)</sup>**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$f_{PLL\_IN}$	PLL input clock frequency <sup>(2)</sup>	-	2.66	-	16	MHz
$D_{PLL\_IN}$	PLL input clock duty cycle	-	45	-	55	%
$f_{PLL\_P\_OUT}$	PLL multiplier output clock P	Voltage scaling Range 1	3.09	-	122	MHz
		Voltage scaling Range 2	3.09	-	40	
$f_{PLL\_Q\_OUT}$	PLL multiplier output clock Q	Voltage scaling Range 1	12	-	128	MHz
		Voltage scaling Range 2	12	-	33	
$f_{PLL\_R\_OUT}$	PLL multiplier output clock R	Voltage scaling Range 1	12	-	64	MHz
		Voltage scaling Range 2	12	-	16	
$f_{VCO\_OUT}$	PLL VCO output	Voltage scaling Range 1	96	-	344	MHz
		Voltage scaling Range 2	96	-	128	
$t_{LOCK}$	PLL lock time	-	-	15	40	$\mu$ s
Jitter	RMS cycle-to-cycle jitter	System clock 56 MHz	-	50	-	$\pm$ ps
	RMS period jitter		-	40	-	
$I_{DD(PLL)}$	PLL power consumption on $V_{DD}$ <sup>(1)</sup>	VCO freq = 96 MHz	-	200	260	$\mu$ A
		VCO freq = 192 MHz	-	300	380	
		VCO freq = 344 MHz	-	520	650	

1. Guaranteed by design.

2. Make sure to use the appropriate division factor M to obtain the specified PLL input clock values.

### 5.3.10 Flash memory characteristics

**Table 48. Flash memory characteristics<sup>(1)</sup>**

Symbol	Parameter	Conditions	Typ	Max	Unit
$t_{prog}$	64-bit programming time	-	85	125	$\mu$ s
$t_{prog\_row}$	Row (32 double word) programming time	Normal programming	2.7	4.6	ms
		Fast programming	1.7	2.8	
$t_{prog\_page}$	Page (2 Kbyte) programming time	Normal programming	21.8	36.6	ms
		Fast programming	13.7	22.4	
$t_{ERASE}$	Page (2 Kbyte) erase time	-	22.0	40.0	ms
$t_{prog\_bank}$	Bank (512 Kbyte <sup>(2)</sup> ) programming time	Normal programming	2.8	4.7	s
		Fast programming	1.8	2.9	
$t_{ME}$	Mass erase time	-	22.1	40.1	ms

**Table 48. Flash memory characteristics<sup>(1)</sup> (continued)**

Symbol	Parameter	Conditions	Typ	Max	Unit
I <sub>DD(FlashA)</sub>	Average consumption from V <sub>DD</sub>	Programming	3	-	mA
		Page erase	3	-	
		Mass erase	5	-	
I <sub>DD(FlashP)</sub>	Maximum current (peak)	Programming, 2 μs peak duration	7	-	mA
		Erase, 41 μs peak duration	7	-	

1. Guaranteed by design.
2. Values provided also apply to devices with less Flash memory than one 512 Kbyte bank

**Table 49. Flash memory endurance and data retention**

Symbol	Parameter	Conditions	Min <sup>(1)</sup>	Unit
N <sub>END</sub>	Endurance	T <sub>A</sub> = -40 to +105 °C	10	kcycles
t <sub>RET</sub>	Data retention	1 kcycle <sup>(2)</sup> at T <sub>A</sub> = 85 °C	30	Years
		1 kcycle <sup>(2)</sup> at T <sub>A</sub> = 105 °C	15	
		1 kcycle <sup>(2)</sup> at T <sub>A</sub> = 125 °C	7	
		10 kcycles <sup>(2)</sup> at T <sub>A</sub> = 55 °C	30	
		10 kcycles <sup>(2)</sup> at T <sub>A</sub> = 85 °C	15	
		10 kcycles <sup>(2)</sup> at T <sub>A</sub> = 105 °C	10	

1. Guaranteed by characterization results.
2. Cycling performed over the whole temperature range.

### 5.3.11 EMC characteristics

Susceptibility tests are performed on a sample basis during device characterization.

#### Functional EMS (electromagnetic susceptibility)

While a simple application is executed on the device (toggling 2 LEDs through I/O ports), the device is stressed by two electromagnetic events until a failure occurs. The failure is indicated by the LEDs:

- **Electrostatic discharge (ESD)** (positive and negative) is applied to all device pins until a functional disturbance occurs. This test is compliant with the IEC 61000-4-2 standard.
- **FTB:** A Burst of Fast Transient voltage (positive and negative) is applied to V<sub>DD</sub> and V<sub>SS</sub> through a 100 pF capacitor, until a functional disturbance occurs. This test is compliant with the IEC 61000-4-4 standard.

A device reset allows normal operations to be resumed.

The test results are given in [Table 50](#). They are based on the EMS levels and classes defined in application note AN1709.

Table 50. EMS characteristics

Symbol	Parameter	Conditions	Level/ Class
$V_{FESD}$	Voltage limits to be applied on any I/O pin to induce a functional disturbance	$V_{DD} = 3.3\text{ V}$ , $T_A = +25\text{ °C}$ , $f_{HCLK} = 64\text{ MHz}$ , LQFP100, conforming to IEC 61000-4-2	2B
$V_{EFTB}$	Fast transient voltage burst limits to be applied through 100 pF on $V_{DD}$ and $V_{SS}$ pins to induce a functional disturbance	$V_{DD} = 3.3\text{ V}$ , $T_A = +25\text{ °C}$ , $f_{HCLK} = 64\text{ MHz}$ , LQFP100, conforming to IEC 61000-4-4	5A

### Designing hardened software to avoid noise problems

EMC characterization and optimization are performed at component level with a typical application environment and simplified MCU software. It should be noted that good EMC performance is highly dependent on the user application and the software in particular.

Therefore it is recommended that the user applies EMC software optimization and prequalification tests in relation with the EMC level requested for his application.

#### Software recommendations

The software flowchart must include the management of runaway conditions such as:

- corrupted program counter
- unexpected reset
- critical data corruption (for example control registers)

#### Prequalification trials

Most of the common failures (unexpected reset and program counter corruption) can be reproduced by manually forcing a low state on the NRST pin or the Oscillator pins for 1 second.

To complete these trials, ESD stress can be applied directly on the device, over the range of specification values. When unexpected behavior is detected, the software can be hardened to prevent unrecoverable errors occurring (see application note AN1015).

### Electromagnetic Interference (EMI)

The electromagnetic field emitted by the device are monitored while a simple application is executed (toggling 2 LEDs through the I/O ports). This emission test is compliant with IEC 61967-2 standard which specifies the test board and the pin loading.

Table 51. EMI characteristics

Symbol	Parameter	Conditions	Monitored frequency band	Max vs. [f <sub>HSE</sub> /f <sub>HCLK</sub> ]	Unit
				8 MHz / 64 MHz	
S <sub>EMI</sub>	Peak level	V <sub>DD</sub> = 3.6 V, T <sub>A</sub> = 25 °C, LQFP100 package compliant with IEC 61967-2	0.1 MHz to 30 MHz	9	dBμV
			30 MHz to 130 MHz	16	
			130 MHz to 1 GHz	4	
			1 GHz to 2 GHz	8	
			EMI level	2.5	-

### 5.3.12 Electrical sensitivity characteristics

Based on three different tests (ESD, LU) using specific measurement methods, the device is stressed in order to determine its performance in terms of electrical sensitivity.

#### Electrostatic discharge (ESD)

Electrostatic discharges (a positive then a negative pulse separated by 1 second) are applied to the pins of each sample according to each pin combination. The sample size depends on the number of supply pins in the device (3 parts × (n+1) supply pins). This test conforms to the ANSI/JEDEC standard.

Table 52. ESD absolute maximum ratings

Symbol	Ratings	Conditions	Class	Maximum value <sup>(1)</sup>	Unit
V <sub>ESD(HBM)</sub>	Electrostatic discharge voltage (human body model)	T <sub>A</sub> = +25 °C, conforming to ANSI/ESDA/JEDEC JS-001	2	2000	V
V <sub>ESD(CDM)</sub>	Electrostatic discharge voltage (charge device model)	T <sub>A</sub> = +25 °C, conforming to ANSI/ESDA/JEDEC JS-002	C2a	250	

1. Based on characterization results, not tested in production.

#### Static latch-up

Two complementary static tests are required on six parts to assess the latch-up performance:

- A supply overvoltage is applied to each power supply pin.
- A current is injected to each input, output and configurable I/O pin.

These tests are compliant with EIA/JESD 78A IC latch-up standard.

Table 53. Electrical sensitivity

Symbol	Parameter	Conditions	Class
LU	Static latch-up class	T <sub>A</sub> = +125 °C conforming to JESD78	II Level A

### 5.3.13 I/O current injection characteristics

As a general rule, current injection to the I/O pins, due to external voltage below  $V_{SS}$  or above  $V_{DDIOx}$  (for standard, 3.3 V-capable I/O pins) should be avoided during normal product operation. However, in order to give an indication of the robustness of the microcontroller in cases when abnormal injection accidentally happens, susceptibility tests are performed on a sample basis during device characterization.

#### Functional susceptibility to I/O current injection

While a simple application is executed on the device, the device is stressed by injecting current into the I/O pins programmed in floating input mode. While current is injected into the I/O pin, one at a time, the device is checked for functional failures.

The failure is indicated by an out-of-range parameter: ADC error above a certain limit (higher than 5 LSB TUE), induced leakage current on adjacent pins out of conventional limits (-5  $\mu$ A/+0  $\mu$ A range) or other functional failure (for example reset occurrence or oscillator frequency deviation).

Negative induced leakage current is caused by negative injection and positive induced leakage current is caused by positive injection.

**Table 54. I/O current injection susceptibility<sup>(1)</sup>**

Symbol	Description		Functional susceptibility		Unit
			Negative injection	Positive injection	
$I_{INJ}$	Injected current on pin	All except PA4, PA5, PA6, PB0, PB3, and PC0	-5	N/A	mA
		PA4, PA5	-5	0	mA
		PA6, PB0, PB3, and PC0	0	N/A	mA

1. Based on characterization results, not tested in production.

### 5.3.14 I/O port characteristics

#### General input/output characteristics

Unless otherwise specified, the parameters given in [Table 55](#) are derived from tests performed under the conditions summarized in [Table 24: General operating conditions](#). All I/Os are designed as CMOS- and TTL-compliant.

**Table 55. I/O static characteristics**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit	
$V_{IL}^{(1)}$	I/O input low level voltage	All except FT_c	$1.62\text{ V} < V_{DDIOx} < 3.6\text{ V}$	-	-	$0.3 \times V_{DDIOx}^{(2)}$	V
						$0.39 \times V_{DDIOx} - 0.06^{(3)}$	
		FT_c	$2.7\text{ V} < V_{DDIOx} < 3.6\text{ V}$	-	-	$0.3 \times V_{DDIOx}$	
			$1.62\text{ V} < V_{DDIOx} < 2.7\text{ V}$	-	-	$0.25 \times V_{DDIOx}$	
$V_{IH}^{(1)}$	I/O input high level voltage	All except FT_c	$1.62\text{ V} < V_{DDIOx} < 3.6\text{ V}$	$0.7 \times V_{DDIOx}^{(2)}$	-	-	V
				$0.49 \times V_{DDIOx} + 0.26^{(3)}$	-	-	
		FT_c	$1.62\text{ V} < V_{DDIOx} < 3.6\text{ V}$	$0.7 \times V_{DDIOx}$	-	5	
$V_{hys}^{(3)}$	I/O input hysteresis	TT_xx, FT_xx, NRST	$1.62\text{ V} < V_{DDIOx} < 3.6\text{ V}$	-	200	-	mV
$I_{ikg}$	Input leakage current <sup>(3)</sup>	FT_xx except FT_c and FT_d	$0 < V_{IN} \leq V_{DDIOx}$	-	-	$\pm 70$	nA
			$V_{DDIOx} \leq V_{IN} \leq V_{DDIOx} + 1\text{ V}$	-	-	$600^{(4)}$	
			$V_{DDIOx} + 1\text{ V} < V_{IN} \leq 5.5\text{ V}^{(3)}$	-	-	$150^{(4)}$	
		FT_c	$0 < V_{IN} \leq V_{DDIOx}$	-	-	2000	
			$V_{DDIOx} < V_{IN} \leq 5\text{ V}$	-	-	$3000^{(4)}$	
		FT_d	$0 < V_{IN} \leq V_{DDIOx}$	-	-	4500	
			$V_{DDIOx} < V_{IN} \leq 5.5\text{ V}$	-	-	$9000^{(4)}$	
		TT_a	$0 < V_{IN} \leq V_{DDIOx}$	-	-	$\pm 150$	
$V_{DDIOx} < V_{IN} \leq V_{DDIOx} + 0.3\text{ V}$	-		-	$2000^{(4)}$			
$R_{PU}$	Weak pull-up equivalent resistor <sup>(5)</sup>	$V_{IN} = V_{SS}$	25	40	55	k $\Omega$	
$R_{PD}$	Weak pull-down equivalent resistor <sup>(5)</sup>	$V_{IN} = V_{DDIOx}$	25	40	55	k $\Omega$	
$C_{IO}$	I/O pin capacitance	-	-	5	-	pF	

1. Refer to [Figure 24: I/O input characteristics](#).

2. Tested in production.

3. Guaranteed by design.

4. This value represents the pad leakage of the I/O itself. The total product pad leakage is provided by this formula:  
 $I_{Total\_leak\_max} = 10 \mu A + [\text{number of I/Os where } V_{IN} \text{ is applied on the pad}] \times I_{Ikg}(\text{Max})$ .
5. Pull-up and pull-down resistors are designed with a true resistance in series with a switchable PMOS/NMOS. This PMOS/NMOS contribution to the series resistance is minimal (~10% order).

All I/Os are CMOS- and TTL-compliant (no software configuration required). Their characteristics cover more than the strict CMOS-technology or TTL parameters, as shown in [Figure 24](#).

Figure 24. I/O input characteristics

Characteristics of FT\_e I/Os

The following table and figure specify input characteristics of FT\_e I/Os.

Table 56. Input characteristics of FT\_e I/Os

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$I_{INJ}$	Injected current on pin	-	-	-	5	mA
$V_{DDIO1}-V_{IN}$	Voltage over $V_{DDIO1}$	$I_{INJ} = 5 \text{ mA}$	-	-	2	V
$R_d$	Diode dynamic serial resistor	$I_{INJ} = 5 \text{ mA}$	-	-	300	$\Omega$

Figure 25. Current injection into FT\_e input with diode active

### Output driving current

The GPIOs (general purpose input/outputs) can sink or source up to  $\pm 8$  mA, and up to  $\pm 15$  mA with relaxed  $V_{OL}/V_{OH}$ .

In the user application, the number of I/O pins which can drive current must be limited to respect the absolute maximum rating specified in [Section 5.2](#):

- The sum of the currents sourced by all the I/Os on  $V_{DDIO1}$ , plus the maximum consumption of the MCU sourced on  $V_{DD}$ , cannot exceed the absolute maximum rating  $I_{VDD}$  (see [Table 21: Voltage characteristics](#)).
- The sum of the currents sunk by all the I/Os on  $V_{SS}$ , plus the maximum consumption of the MCU sunk on  $V_{SS}$ , cannot exceed the absolute maximum rating  $I_{VSS}$  (see [Table 21: Voltage characteristics](#)).

### Output voltage levels

Unless otherwise specified, the parameters given in the table below are derived from tests performed under the ambient temperature and supply voltage conditions summarized in [Table 24: General operating conditions](#). All I/Os are CMOS- and TTL-compliant (FT OR TT unless otherwise specified).

**Table 57. Output voltage characteristics<sup>(1)</sup>**

Symbol	Parameter	Conditions	Min	Max	Unit
$V_{OL}$	Output low level voltage for an I/O pin	CMOS port <sup>(2)</sup>	-	0.4	V
$V_{OH}$	Output high level voltage for an I/O pin	$ I_{IO}  = 2\text{ mA}$ for FT_c I/Os $= 8\text{ mA}$ for other I/Os $V_{DDIOx} \geq 2.7\text{ V}$	$V_{DDIOx} - 0.4$	-	
$V_{OL}^{(3)}$	Output low level voltage for an I/O pin	TTL port <sup>(2)</sup>	-	0.4	
$V_{OH}^{(3)}$	Output high level voltage for an I/O pin	$ I_{IO}  = 2\text{ mA}$ for FT_c I/Os $= 8\text{ mA}$ for other I/Os $V_{DDIOx} \geq 2.7\text{ V}$	2.4	-	
$V_{OL}^{(3)}$	Output low level voltage for an I/O pin	All I/Os except FT_c	-	1.3	
$V_{OH}^{(3)}$	Output high level voltage for an I/O pin	$ I_{IO}  = 15\text{ mA}$ $V_{DDIOx} \geq 2.7\text{ V}$	$V_{DDIOx} - 1.3$	-	
$V_{OL}^{(3)}$	Output low level voltage for an I/O pin	$ I_{IO}  = 1\text{ mA}$ for FT_c I/Os $= 3\text{ mA}$ for other I/Os $V_{DDIOx} \geq 1.62\text{ V}$	-	0.4	
$V_{OH}^{(3)}$	Output high level voltage for an I/O pin	$V_{DDIOx} \geq 1.62\text{ V}$	$V_{DDIOx} - 0.45$	-	
$V_{OLFM+}^{(3)}$	Output low level voltage for an FT I/O pin in FM+ mode (FT I/O with _f option)	$ I_{IO}  = 20\text{ mA}$ $V_{DDIOx} \geq 2.7\text{ V}$	-	0.4	
		$ I_{IO}  = 9\text{ mA}$ $V_{DDIOx} \geq 1.62\text{ V}$	-	0.4	

1. The  $I_{IO}$  current sourced or sunk by the device must always respect the absolute maximum rating specified in [Table 21: Voltage characteristics](#), and the sum of the currents sourced or sunk by all the I/Os (I/O ports and control pins) must always respect the absolute maximum ratings  $\Sigma I_{IO}$ .
2. TTL and CMOS outputs are compatible with JEDEC standards JESD36 and JESD52.
3. Guaranteed by design.

### Input/output AC characteristics

The definition and values of input/output AC characteristics are given in [Figure 26](#) and [Table 58](#), respectively.

Unless otherwise specified, the parameters given are derived from tests performed under the ambient temperature and supply voltage conditions summarized in [Table 24: General operating conditions](#).

**Table 58. I/O AC characteristics<sup>(1)(2)</sup>**

Speed	Symbol	Parameter	Conditions	Min	Max	Unit
00	Fmax	Maximum frequency	$C=50\text{ pF}, 2.7\text{ V} \leq V_{DDIOx} \leq 3.6\text{ V}$	-	2	MHz
			$C=50\text{ pF}, 1.6\text{ V} \leq V_{DDIOx} \leq 2.7\text{ V}$	-	0.35	
			$C=10\text{ pF}, 2.7\text{ V} \leq V_{DDIOx} \leq 3.6\text{ V}$	-	3	
			$C=10\text{ pF}, 1.6\text{ V} \leq V_{DDIOx} \leq 2.7\text{ V}$	-	0.45	
	Tr/Tf	Output rise and fall time	$C=50\text{ pF}, 2.7\text{ V} \leq V_{DDIOx} \leq 3.6\text{ V}$	-	100	ns
			$C=50\text{ pF}, 1.6\text{ V} \leq V_{DDIOx} \leq 2.7\text{ V}$	-	225	
			$C=10\text{ pF}, 2.7\text{ V} \leq V_{DDIOx} \leq 3.6\text{ V}$	-	75	
			$C=10\text{ pF}, 1.6\text{ V} \leq V_{DDIOx} \leq 2.7\text{ V}$	-	150	

Table 58. I/O AC characteristics<sup>(1)(2)</sup> (continued)

Speed	Symbol	Parameter	Conditions	Min	Max	Unit
01	Fmax	Maximum frequency	C=50 pF, 2.7 V ≤ V <sub>DDIOx</sub> ≤ 3.6 V	-	10	MHz
			C=50 pF, 1.6 V ≤ V <sub>DDIOx</sub> ≤ 2.7 V	-	2	
			C=10 pF, 2.7 V ≤ V <sub>DDIOx</sub> ≤ 3.6 V	-	15	
			C=10 pF, 1.6 V ≤ V <sub>DDIOx</sub> ≤ 2.7 V	-	2.5	
	Tr/Tf	Output rise and fall time	C=50 pF, 2.7 V ≤ V <sub>DDIOx</sub> ≤ 3.6 V	-	30	ns
			C=50 pF, 1.6 V ≤ V <sub>DDIOx</sub> ≤ 2.7 V	-	60	
			C=10 pF, 2.7 V ≤ V <sub>DDIOx</sub> ≤ 3.6 V	-	15	
			C=10 pF, 1.6 V ≤ V <sub>DDIOx</sub> ≤ 2.7 V	-	30	
10	Fmax	Maximum frequency	C=50 pF, 2.7 V ≤ V <sub>DDIOx</sub> ≤ 3.6 V	-	30	MHz
			C=50 pF, 1.6 V ≤ V <sub>DDIOx</sub> ≤ 2.7 V	-	15	
			C=10 pF, 2.7 V ≤ V <sub>DDIOx</sub> ≤ 3.6 V	-	60	
			C=10 pF, 1.6 V ≤ V <sub>DDIOx</sub> ≤ 2.7 V	-	30	
	Tr/Tf	Output rise and fall time	C=50 pF, 2.7 V ≤ V <sub>DDIOx</sub> ≤ 3.6 V	-	11	ns
			C=50 pF, 1.6 V ≤ V <sub>DDIOx</sub> ≤ 2.7 V	-	22	
			C=10 pF, 2.7 V ≤ V <sub>DDIOx</sub> ≤ 3.6 V	-	4	
			C=10 pF, 1.6 V ≤ V <sub>DDIOx</sub> ≤ 2.7 V	-	8	
11	Fmax	Maximum frequency	C=30 pF, 2.7 V ≤ V <sub>DDIOx</sub> ≤ 3.6 V	-	60	MHz
			C=30 pF, 1.6 V ≤ V <sub>DDIOx</sub> ≤ 2.7 V	-	30	
			C=10 pF, 2.7 V ≤ V <sub>DDIOx</sub> ≤ 3.6 V	-	80 <sup>(3)</sup>	
			C=10 pF, 1.6 V ≤ V <sub>DDIOx</sub> ≤ 2.7 V	-	40	
	Tr/Tf	Output rise and fall time	C=30 pF, 2.7 V ≤ V <sub>DDIOx</sub> ≤ 3.6 V	-	5.5	ns
			C=30 pF, 1.6 V ≤ V <sub>DDIOx</sub> ≤ 2.7 V	-	11	
			C=10 pF, 2.7 V ≤ V <sub>DDIOx</sub> ≤ 3.6 V	-	2.5	
			C=10 pF, 1.6 V ≤ V <sub>DDIOx</sub> ≤ 2.7 V	-	5	
Fm+	Fmax	Maximum frequency	C=50 pF, 1.6 V ≤ V <sub>DDIOx</sub> ≤ 3.6 V	-	1	MHz
	Tf	Output fall time <sup>(4)</sup>	C=50 pF, 1.6 V ≤ V <sub>DDIOx</sub> ≤ 3.6 V	-	5	ns

1. The I/O speed is configured using the OSPEEDRy[1:0] bits. The Fm+ mode is configured in the SYSCFG\_CFGR1 register. Refer to the RM0444 reference manual for a description of GPIO Port configuration register.
2. Guaranteed by design.
3. This value represents the I/O capability but the maximum system frequency is limited to 64 MHz.
4. The fall time is defined between 70% and 30% of the output waveform, according to I<sup>2</sup>C specification.

Figure 26. I/O AC characteristics definition<sup>(1)</sup>

1. Refer to [Table 58: I/O AC characteristics](#).

### 5.3.15 NRST input characteristics

The NRST input driver uses CMOS technology. It is connected to a permanent pull-up resistor,  $R_{PU}$ .

Unless otherwise specified, the parameters given in the following table are derived from tests performed under the ambient temperature and supply voltage conditions summarized in [Table 24: General operating conditions](#).

Table 59. NRST pin characteristics<sup>(1)</sup>

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$V_{IL(NRST)}$	NRST input low level voltage	-	-	-	$0.3 \times V_{DDIO1}$	V
$V_{IH(NRST)}$	NRST input high level voltage	-	$0.7 \times V_{DDIO1}$	-	-	
$V_{hys(NRST)}$	NRST Schmitt trigger voltage hysteresis	-	-	200	-	mV
$R_{PU}$	Weak pull-up equivalent resistor <sup>(2)</sup>	$V_{IN} = V_{SS}$	25	40	55	k $\Omega$
$V_F(NRST)$	NRST input filtered pulse	-	-	-	70	ns
$V_{NF(NRST)}$	NRST input not filtered pulse	$1.7 \text{ V} \leq V_{DD} \leq 3.6 \text{ V}$	350	-	-	ns

1. Guaranteed by design.

2. The pull-up is designed with a true resistance in series with a switchable PMOS. This PMOS contribution to the series resistance is minimal (~10% order).

Figure 27. Recommended NRST pin protection

1. The reset network protects the device against parasitic resets.
2. The user must ensure that the level on the NRST pin can go below the  $V_{IL(NRST)}$  max level specified in [Table 59: NRST pin characteristics](#). Otherwise the reset will not be taken into account by the device.
3. The external capacitor on NRST must be placed as close as possible to the device.

### 5.3.16 Analog switch booster

Table 60. Analog switch booster characteristics<sup>(1)</sup>

Symbol	Parameter	Min	Typ	Max	Unit
$V_{DD}$	Supply voltage	1.62 V	-	3.6	V
$t_{SU(BOOST)}$	Booster startup time	-	-	240	$\mu s$
$I_{DD(BOOST)}$	Booster consumption for $1.62\text{ V} \leq V_{DD} \leq 2.0\text{ V}$	-	-	250	$\mu A$
	Booster consumption for $2.0\text{ V} \leq V_{DD} \leq 2.7\text{ V}$	-	-	500	
	Booster consumption for $2.7\text{ V} \leq V_{DD} \leq 3.6\text{ V}$	-	-	900	

1. Guaranteed by design.

### 5.3.17 Analog-to-digital converter characteristics

Unless otherwise specified, the parameters given in [Table 61](#) are preliminary values derived from tests performed under ambient temperature,  $f_{PCLK}$  frequency and  $V_{DDA}$  supply voltage conditions summarized in [Table 24: General operating conditions](#).

*Note:* It is recommended to perform a calibration after each power-up.

Table 61. ADC characteristics<sup>(1)</sup>

Symbol	Parameter	Conditions <sup>(2)</sup>	Min	Typ	Max	Unit
$V_{DDA}$	Analog supply voltage	-	1.62	-	3.6	V
$V_{REF+}$	Positive reference voltage	$V_{DDA} \geq 2\text{ V}$	2	-	$V_{DDA}$	V
		$V_{DDA} < 2\text{ V}$	$V_{DDA}$			

Table 61. ADC characteristics<sup>(1)</sup> (continued)

		$1.65\text{ V} < V_{DDA} = V_{REF+} < 3.6\text{ V};$ $T_A = \text{entire range}$ Range 1: $f_{ADC} = 35\text{ MHz}; f_s \leq 2.2\text{ MSps};$ Range 2: $f_{ADC} = 16\text{ MHz}; f_s \leq 1.1\text{ MSps};$	60	64	-	
THD	Total harmonic distortion	$V_{DDA} = V_{REF+} = 3\text{ V};$ $f_{ADC} = 35\text{ MHz}; f_s \leq 2.5\text{ MSps};$ $T_A = 25\text{ }^\circ\text{C}$	-	-74	-73	dB
		$2\text{ V} < V_{DDA} = V_{REF+} < 3.6\text{ V};$ $f_{ADC} = 35\text{ MHz}; f_s \leq 2.5\text{ MSps};$ $T_A = \text{entire range}$	-	-74	-70	
		$1.65\text{ V} < V_{DDA} = V_{REF+} < 3.6\text{ V};$ $T_A = \text{entire range}$ Range 1: $f_{ADC} = 35\text{ MHz}; f_s \leq 2.2\text{ MSps};$ Range 2: $f_{ADC} = 16\text{ MHz}; f_s \leq 1.1\text{ MSps};$	-	-74	-70	

1. Based on characterization results, not tested in production.
2. ADC DC accuracy values are measured after internal calibration.
3. Injecting negative current on any analog input pin significantly reduces the accuracy of A-to-D conversion of signal on another analog input. It is recommended to add a Schottky diode (pin to ground) to analog pins susceptible to receive negative current.
4. I/O analog switch voltage booster enabled (BOOSTEN = 1 in the SYSCFG\_CFGR1) when  $V_{DDA} < 2.4\text{ V}$  and disabled when  $V_{DDA} \geq 2.4\text{ V}$ .

Figure 28. ADC accuracy characteristics

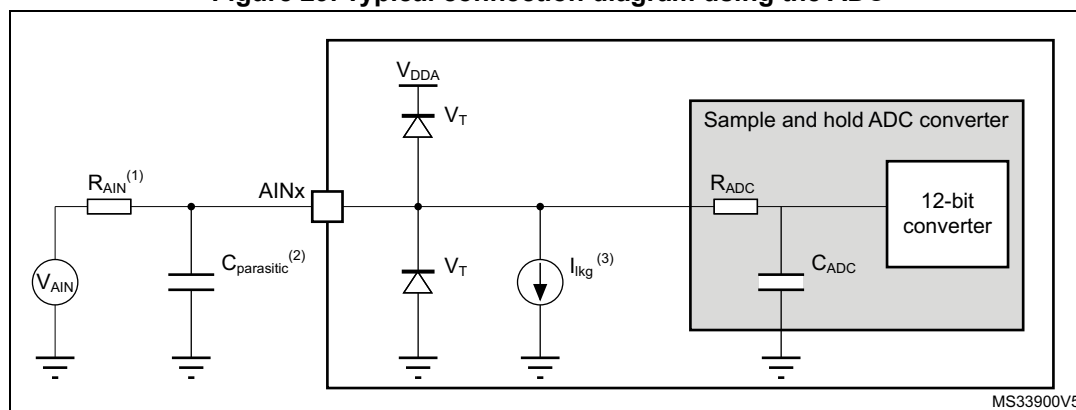

Figure 29. Typical connection diagram using the ADC

1. Refer to [Table 61: ADC characteristics](#) for the values of  $R_{AIN}$  and  $C_{ADC}$ .
2.  $C_{parasitic}$  represents the capacitance of the PCB (dependent on soldering and PCB layout quality) plus the pad capacitance (refer to [Table 55: I/O static characteristics](#) for the value of the pad capacitance). A high  $C_{parasitic}$  value will downgrade conversion accuracy. To remedy this,  $f_{ADC}$  should be reduced.
3. Refer to [Table 55: I/O static characteristics](#) for the values of  $I_{kg}$ .

**General PCB design guidelines**

Power supply decoupling should be performed as shown in [Figure 15: Power supply scheme](#). The 100 nF capacitor should be ceramic (good quality) and it should be placed as close as possible to the chip.

## 5.3.18 Digital-to-analog converter characteristics

Table 64. DAC characteristics<sup>(1)</sup>

Symbol	Parameter	Conditions	Min	Typ	Max	Unit	
V <sub>DDA</sub>	Analog supply voltage for DAC ON	DAC output buffer OFF, DAC_OUT pin not connected (internal connection only)	1.71	-	3.6	V	
		Other modes	1.80	-			
V <sub>REF+</sub>	Positive reference voltage	DAC output buffer OFF, DAC_OUT pin not connected (internal connection only)	1.71	-	V <sub>DDA</sub>	V	
		Other modes	1.80	-			
R <sub>L</sub>	Resistive load	DAC output buffer ON	connected to V <sub>SSA</sub>	5	-	-	kΩ
			connected to V <sub>DDA</sub>	25	-	-	
R <sub>O</sub>	Output Impedance	DAC output buffer OFF	9.6	11.7	13.8	kΩ	
R <sub>BON</sub>	Output impedance sample and hold mode, output buffer ON	V <sub>DD</sub> = 2.7 V	-	-	2	kΩ	
		V <sub>DD</sub> = 2.0 V	-	-	3.5		
R <sub>BOFF</sub>	Output impedance sample and hold mode, output buffer OFF	V <sub>DD</sub> = 2.7 V	-	-	16.5	kΩ	
		V <sub>DD</sub> = 2.0 V	-	-	18.0		
C <sub>L</sub>	Capacitive load	DAC output buffer ON	-	-	50	pF	
C <sub>SH</sub>		Sample and hold mode	-	0.1	1	μF	
V <sub>DAC_OUT</sub>	Voltage on DAC_OUT output	DAC output buffer ON	0.2	-	V <sub>REF+</sub> - 0.2	V	
		DAC output buffer OFF	0	-	V <sub>REF+</sub>		
t <sub>SETTLING</sub>	Settling time (full scale: for a 12-bit code transition between the lowest and the highest input codes when DAC_OUT reaches final value ±0.5LSB, ±1 LSB, ±2 LSB, ±4 LSB, ±8 LSB)	Normal mode DAC output buffer ON CL ≤ 50 pF, RL ≥ 5 kΩ	±0.5 LSB	-	1.7	3	μs
			±1 LSB	-	1.6	2.9	
			±2 LSB	-	1.55	2.85	
			±4 LSB	-	1.48	2.8	
			±8 LSB	-	1.4	2.75	
		Normal mode DAC output buffer OFF, ±1LSB, CL = 10 pF	-	2	2.5		
t <sub>WAKEUP</sub> <sup>(2)</sup>	Wakeup time from off state (setting the ENx bit in the DAC Control register) until final value ±1 LSB	Normal mode DAC output buffer ON CL ≤ 50 pF, RL ≥ 5 kΩ	-	4.2	7.5	μs	
		Normal mode DAC output buffer OFF, CL ≤ 10 pF	-	2	5		
PSRR	V <sub>DDA</sub> supply rejection ratio	Normal mode DAC output buffer ON CL ≤ 50 pF, RL = 5 kΩ, DC	-	-80	-28	dB	

Table 64. DAC characteristics<sup>(1)</sup> (continued)

Symbol	Parameter	Conditions	Min	Typ	Max	Unit	
$T_{W\_to\_W}$	Minimum time between two consecutive writes into the DAC_DORx register to guarantee a correct DAC_OUT for a small variation of the input code (1 LSB)	DAC_MCR:MODEx[2:0] = 000 or 001 CL ≤ 50 pF; RL ≥ 5 kΩ	1	-	-	μs	
		DAC_MCR:MODEx[2:0] = 010 or 011 CL ≤ 10 pF	1.4	-	-		
$t_{SAMP}$	Sampling time in sample and hold mode (code transition between the lowest input code and the highest input code when DACOUT reaches final value ±1LSB)	DAC_OUT pin connected	DAC output buffer ON, C <sub>SH</sub> = 100 nF	-	0.7	3.5	ms
			DAC output buffer OFF, C <sub>SH</sub> = 100 nF	-	10.5	18	
		DAC_OUT pin not connected (internal connection only)	DAC output buffer OFF	-	2	3.5	μs
$I_{leak}$	Output leakage current	Sample and hold mode, DAC_OUT pin connected	-	-	-(3)	nA	
$C_{iint}$	Internal sample and hold capacitor	-	5.2	7	8.8	pF	
$t_{TRIM}$	Middle code offset trim time	DAC output buffer ON	50	-	-	μs	
$V_{offset}$	Middle code offset for 1 trim code step	V <sub>REF+</sub> = 3.6 V	-	1500	-	μV	
		V <sub>REF+</sub> = 1.8 V	-	750	-		
$I_{DDA(DAC)}$	DAC consumption from V <sub>DDA</sub>	DAC output buffer ON	No load, middle code (0x800)	-	315	500	μA
			No load, worst code (0xF1C)	-	450	670	
		DAC output buffer OFF	No load, middle code (0x800)	-	-	0.2	
		Sample and hold mode, C <sub>SH</sub> = 100 nF	-	$315 \times \frac{T_{on}}{T_{on} + T_{off}}^{(4)}$	$670 \times \frac{T_{on}}{T_{on} + T_{off}}^{(4)}$		

Table 64. DAC characteristics<sup>(1)</sup> (continued)

Symbol	Parameter	Conditions	Min	Typ	Max	Unit	
I <sub>DDV(DAC)</sub>	DAC consumption from V <sub>REF+</sub>	DAC output buffer ON	No load, middle code (0x800)	-	185	240	μA
			No load, worst code (0xF1C)	-	340	400	
		DAC output buffer OFF	No load, middle code (0x800)	-	155	205	
		Sample and hold mode, buffer ON, C <sub>SH</sub> = 100 nF, worst case	-	185 x $\frac{T_{on}}{T_{off}^{(4)}}$	400 x $\frac{T_{on}}{T_{off}^{(4)}}$		
		Sample and hold mode, buffer OFF, C <sub>SH</sub> = 100 nF, worst case	-	155 x $\frac{T_{on}}{T_{off}^{(4)}}$	205 x $\frac{T_{on}}{T_{off}^{(4)}}$		

1. Guaranteed by design.
2. In buffered mode, the output can overshoot above the final value for low input code (starting from min value).
3. Refer to [Table 55: I/O static characteristics](#).
4. T<sub>on</sub> is the Refresh phase duration. T<sub>off</sub> is the Hold phase duration. Refer to RM0444 reference manual for more details.

Figure 30. 12-bit buffered / non-buffered DAC

1. The DAC integrates an output buffer that can be used to reduce the output impedance and to drive external loads directly without the use of an external operational amplifier. The buffer can be bypassed by configuring the BOFFx bit in the DAC\_CR register.

Table 65. DAC accuracy<sup>(1)</sup>

Symbol	Parameter	Conditions	Min	Typ	Max	Unit	
DNL	Differential non linearity <sup>(2)</sup>	DAC output buffer ON	-	-	±2	LSB	
		DAC output buffer OFF	-	-	±2		
-	monotonicity	10 bits	guaranteed				
INL	Integral non linearity <sup>(3)</sup>	DAC output buffer ON CL ≤ 50 pF, RL ≥ 5 kΩ	-	-	±4		
		DAC output buffer OFF CL ≤ 50 pF, no RL	-	-	±4		
Offset	Offset error at code 0x800 <sup>(3)</sup>	DAC output buffer ON CL ≤ 50 pF, RL ≥ 5 kΩ	V <sub>REF+</sub> = 3.6 V	-	-		±12
			V <sub>REF+</sub> = 1.8 V	-	-		±25
		DAC output buffer OFF CL ≤ 50 pF, no RL		-	-		±8
Offset1	Offset error at code 0x001 <sup>(4)</sup>	DAC output buffer OFF CL ≤ 50 pF, no RL	-	-	±5		
OffsetCal	Offset Error at code 0x800 after calibration	DAC output buffer ON CL ≤ 50 pF, RL ≥ 5 kΩ	V <sub>REF+</sub> = 3.6 V	-	-	±5	
			V <sub>REF+</sub> = 1.8 V	-	-	±7	
Gain	Gain error <sup>(5)</sup>	DAC output buffer ON CL ≤ 50 pF, RL ≥ 5 kΩ	-	-	±0.5	%	
		DAC output buffer OFF CL ≤ 50 pF, no RL	-	-	±0.5		
TUE	Total unadjusted error	DAC output buffer ON CL ≤ 50 pF, RL ≥ 5 kΩ	-	-	±30	LSB	
		DAC output buffer OFF CL ≤ 50 pF, no RL	-	-	±12		
TUECal	Total unadjusted error after calibration	DAC output buffer ON CL ≤ 50 pF, RL ≥ 5 kΩ	-	-	±23	LSB	
SNR	Signal-to-noise ratio	DAC output buffer ON CL ≤ 50 pF, RL ≥ 5 kΩ 1 kHz, BW 500 kHz	-	71.2	-	dB	
		DAC output buffer OFF CL ≤ 50 pF, no RL, 1 kHz BW 500 kHz	-	71.6	-		
THD	Total harmonic distortion	DAC output buffer ON CL ≤ 50 pF, RL ≥ 5 kΩ, 1 kHz	-	-78	-	dB	
		DAC output buffer OFF CL ≤ 50 pF, no RL, 1 kHz	-	-79	-		

**Table 65. DAC accuracy<sup>(1)</sup> (continued)**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
SINAD	Signal-to-noise and distortion ratio	DAC output buffer ON CL ≤ 50 pF, RL ≥ 5 kΩ, 1 kHz	-	70.4	-	dB
		DAC output buffer OFF CL ≤ 50 pF, no RL, 1 kHz	-	71	-	
ENOB	Effective number of bits	DAC output buffer ON CL ≤ 50 pF, RL ≥ 5 kΩ, 1 kHz	-	11.4	-	bits
		DAC output buffer OFF CL ≤ 50 pF, no RL, 1 kHz	-	11.5	-	

1. Guaranteed by design.
2. Difference between two consecutive codes - 1 LSB.
3. Difference between measured value at Code i and the value at Code i on a line drawn between Code 0 and last Code 4095.
4. Difference between the value measured at Code (0x001) and the ideal value.
5. Difference between ideal slope of the transfer function and measured slope computed from code 0x000 and 0xFF when buffer is OFF, and from code giving 0.2 V and (V<sub>REF+</sub> - 0.2) V when buffer is ON.

### 5.3.19 Voltage reference buffer characteristics

**Table 66. VREFBUF characteristics<sup>(1)</sup>**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit	
V <sub>DDA</sub>	Analog supply voltage	Normal mode	V <sub>RS</sub> = 0	2.4	-	3.6	V
			V <sub>RS</sub> = 1	2.8	-	3.6	
		Degraded mode <sup>(2)</sup>	V <sub>RS</sub> = 0	1.65	-	2.4	
			V <sub>RS</sub> = 1	1.65	-	2.8	
V <sub>REFBUF_OUT</sub>	Voltage reference output	I <sub>load</sub> = 100 μA T = 30 °C	V <sub>RS</sub> = 0	2.038	2.042	2.046	
			V <sub>RS</sub> = 1	2.497	2.5	2.503	
			V <sub>RS</sub> = 0	V <sub>DDA</sub> -150 mV	-	V <sub>DDA</sub>	
			V <sub>RS</sub> = 1	V <sub>DDA</sub> -150 mV	-	V <sub>DDA</sub>	
TRIM	Trim step resolution	-	-	-	±0.05	±0.1	%
CL	Load capacitor	-	-	0.5	1	1.5	μF
esr	Equivalent Serial Resistor of C <sub>load</sub>	-	-	-	-	2	Ω
I <sub>load</sub>	Static load current	-	-	-	-	4	mA
I <sub>line_reg</sub>	Line regulation	2.8 V ≤ V <sub>DDA</sub> ≤ 3.6 V	I <sub>load</sub> = 500 μA	-	200	1000	ppm/V
			I <sub>load</sub> = 4 mA	-	100	500	
I <sub>load_reg</sub>	Load regulation	500 μA ≤ I <sub>load</sub> ≤ 4 mA	Normal mode	-	50	500	ppm/mA

Table 66. VREFBUF characteristics<sup>(1)</sup> (continued)

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$T_{\text{Coeff\_vrefbuf}}$	Temperature coefficient of VREFBUF <sup>(3)</sup>	-40 °C < $T_J$ < +125 °C	-	-	50	ppm/ °C
PSRR	Power supply rejection	DC	40	60	-	dB
		100 kHz	25	40	-	
$t_{\text{START}}$	Start-up time	$CL = 0.5 \mu\text{F}^{(4)}$	-	300	350	$\mu\text{s}$
		$CL = 1.1 \mu\text{F}^{(4)}$	-	500	650	
		$CL = 1.5 \mu\text{F}^{(4)}$	-	650	800	
$I_{\text{INRUSH}}$	Control of maximum DC current drive on VREFBUF_OUT during start-up phase <sup>(5)</sup>	-	-	8	-	mA
$I_{\text{DDA}}(\text{VREFBUF})$	VREFBUF consumption from $V_{\text{DDA}}$	$I_{\text{load}} = 0 \mu\text{A}$	-	16	25	$\mu\text{A}$
		$I_{\text{load}} = 500 \mu\text{A}$	-	18	30	
		$I_{\text{load}} = 4 \text{mA}$	-	35	50	

1. Guaranteed by design.
2. In degraded mode, the voltage reference buffer can not maintain accurately the output voltage which will follow ( $V_{\text{DDA}}$  - drop voltage).
3. The temperature coefficient at VREF+ output is the sum of  $T_{\text{Coeff\_vrefint}}$  and  $T_{\text{Coeff\_vrefbuf}}$ .
4. The capacitive load must include a 100 nF capacitor in order to cut-off the high frequency noise.
5. To correctly control the VREFBUF inrush current during start-up phase and scaling change, the  $V_{\text{DDA}}$  voltage should be in the range [2.4 V to 3.6 V] and [2.8 V to 3.6 V] respectively for  $V_{\text{RS}} = 0$  and  $V_{\text{RS}} = 1$ .

### 5.3.20 Comparator characteristics

Table 67. COMP characteristics<sup>(1)</sup>

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$V_{\text{DDA}}$	Analog supply voltage	-	1.62	-	3.6	V
$V_{\text{IN}}$	Comparator input voltage range	-	0	-	$V_{\text{DDA}}$	V
$V_{\text{BG}}^{(2)}$	Scaler input voltage	-	$V_{\text{REFINT}}$			V
$V_{\text{SC}}$	Scaler offset voltage	-	-	±5	±10	mV
$I_{\text{DDA}}(\text{SCALER})$	Scaler static consumption from $V_{\text{DDA}}$	BRG_EN=0 (bridge disable)	-	200	300	nA
		BRG_EN=1 (bridge enable)	-	0.8	1	$\mu\text{A}$
$t_{\text{START\_SCALER}}$	Scaler startup time	-	-	100	200	$\mu\text{s}$

Table 67. COMP characteristics<sup>(1)</sup> (continued)

Symbol	Parameter	Conditions	Min	Typ	Max	Unit	
$t_{START}$	Comparator startup time to reach propagation delay specification	High-speed mode	-	-	5	$\mu s$	
		Medium-speed mode	-	-	15		
$t_D$	Propagation delay	200 mV step; 100 mV overdrive	High-speed mode	-	30	50	ns
			Medium-speed mode	-	0.3	0.6	$\mu s$
		>200 mV step; 100 mV overdrive	High-speed mode	-	-	70	ns
			Medium-speed mode	-	-	1.2	$\mu s$
$V_{offset}$	Comparator offset error	Full common mode range	-	$\pm 5$	$\pm 20$	mV	
$V_{hys}$	Comparator hysteresis	No hysteresis	-	0	-	mV	
		Low hysteresis	-	10	-		
		Medium hysteresis	-	20	-		
		High hysteresis	-	30	-		
$I_{DDA(COMP)}$	Comparator consumption from $V_{DDA}$	Medium-speed mode; No deglitcher	Static	-	5	7.5	$\mu A$
			With 50 kHz and $\pm 100$ mV overdrive square signal	-	6	-	
		Medium-speed mode; With deglitcher	Static	-	7	10	
			With 50 kHz and $\pm 100$ mV overdrive square signal	-	8	-	
		High-speed mode	Static	-	250	400	
			With 50 kHz and $\pm 100$ mV overdrive square signal	-	250	-	

1. Guaranteed by design.

2. Refer to [Table 27: Embedded internal voltage reference](#).

### 5.3.21 Temperature sensor characteristics

Table 68. TS characteristics

Symbol	Parameter	Min	Typ	Max	Unit
$T_L^{(1)}$	$V_{TS}$ linearity with temperature	-	$\pm 1$	$\pm 2$	$^{\circ}C$
Avg_Slope <sup>(2)</sup>	Average slope	2.3	2.5	2.7	mV/ $^{\circ}C$
$V_{30}$	Voltage at 30 $^{\circ}C$ ( $\pm 5$ $^{\circ}C$ ) <sup>(3)</sup>	0.742	0.76	0.785	V
$t_{START(TS\_BUF)}^{(1)}$	Sensor Buffer Start-up time in continuous mode <sup>(4)</sup>	-	8	15	$\mu s$
$t_{START}^{(1)}$	Start-up time when entering in continuous mode <sup>(4)</sup>	-	70	120	$\mu s$

**Table 68. TS characteristics (continued)**

Symbol	Parameter	Min	Typ	Max	Unit
$t_{S\_temp}^{(1)}$	ADC sampling time when reading the temperature	5	-	-	$\mu s$
$I_{DD(TS)}^{(1)}$	Temperature sensor consumption from $V_{DD}$ , when selected by ADC	-	4.7	7	$\mu A$

1. Guaranteed by design.
2. Based on characterization results, not tested in production.
3. Measured at  $V_{DDA} = 3.0 V \pm 10 mV$ . The  $V_{30}$  ADC conversion result is stored in the TS\_CAL1 byte.
4. Continuous mode means Run/Sleep modes, or temperature sensor enable in Low-power run/Low-power sleep modes.

### 5.3.22 $V_{BAT}$ monitoring characteristics

**Table 69.  $V_{BAT}$  monitoring characteristics**

Symbol	Parameter	Min	Typ	Max	Unit
R	Resistor bridge for $V_{BAT}$	-	39	-	$k\Omega$
Q	Ratio on $V_{BAT}$ measurement	-	3	-	-
$E_r^{(1)}$	Error on Q	-10	-	10	%
$t_{S\_vbat}^{(1)}$	ADC sampling time when reading the VBAT	12	-	-	$\mu s$

1. Guaranteed by design.

**Table 70.  $V_{BAT}$  charging characteristics**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$R_{BC}$	Battery charging resistor	VBRS = 0	-	5	-	$k\Omega$
		VBRS = 1	-	1.5	-	

### 5.3.23 Timer characteristics

The parameters given in the following tables are guaranteed by design. Refer to [Section 5.3.14: I/O port characteristics](#) for details on the input/output alternate function characteristics (output compare, input capture, external clock, PWM output).

**Table 71. TIMx<sup>(1)</sup> characteristics**

Symbol	Parameter	Conditions	Min	Max	Unit
$t_{res(TIM)}$	Timer resolution time	-	1	-	$t_{TIMxCLK}$
		$f_{TIMxCLK} = 64 MHz$	15.625	-	ns
$f_{EXT}$	Timer external clock frequency on CH1 to CH4	-	0	$f_{TIMxCLK}/2$	MHz
		$f_{TIMxCLK} = 64 MHz$	0	40	
$Res_{TIM}$	Timer resolution	TIMx (except TIM2)	-	16	bit
		TIM2	-	32	

**Table 71. TIMx<sup>(1)</sup> characteristics (continued)**

Symbol	Parameter	Conditions	Min	Max	Unit
t <sub>COUNTER</sub>	16-bit counter clock period	-	1	65536	t <sub>TIMxCLK</sub>
		f <sub>TIMxCLK</sub> = 64 MHz	0.015625	1024	µs
t <sub>MAX_COUNT</sub>	Maximum possible count with 32-bit counter	-	-	65536 × 65536	t <sub>TIMxCLK</sub>
		f <sub>TIMxCLK</sub> = 64 MHz	-	67.10	s

1. TIMx is used as a general term in which x stands for 1, 2, 3, 4, 5, 6, 7, 8, 15, 16 or 17.

**Table 72. IWDG min/max timeout period at 32 kHz LSI clock<sup>(1)</sup>**

Prescaler divider	PR[2:0] bits	Min timeout RL[11:0]= 0x000	Max timeout RL[11:0]= 0xFFFF	Unit
/4	0	0.125	512	ms
/8	1	0.250	1024	
/16	2	0.500	2048	
/32	3	1.0	4096	
/64	4	2.0	8192	
/128	5	4.0	16384	
/256	6 or 7	8.0	32768	

1. The exact timings further depend on the phase of the APB interface clock versus the LSI clock, which causes an uncertainty of one RC period.

### 5.3.24 Characteristics of communication interfaces

#### I<sup>2</sup>C-bus interface characteristics

The I<sup>2</sup>C-bus interface meets timing requirements of the I<sup>2</sup>C-bus specification and user manual rev. 03 for:

- Standard-mode (Sm): with a bit rate up to 100 kbit/s
- Fast-mode (Fm): with a bit rate up to 400 kbit/s
- Fast-mode Plus (Fm+): with a bit rate up to 1 Mbit/s.

The timings are guaranteed by design as long as the I2C peripheral is properly configured (refer to the reference manual RM0444) and when the I2CCLK frequency is greater than the minimum shown in the following table.

**Table 73. Minimum I2CCLK frequency**

Symbol	Parameter	Condition	Typ	Unit	
f <sub>I2CCLK(min)</sub>	Minimum I2CCLK frequency for correct operation of I2C peripheral	Standard-mode		2	MHz
		Fast-mode	Analog filter enabled	9	
			DNF = 0		
			Analog filter disabled	9	
			DNF = 1		
		Fast-mode Plus	Analog filter enabled	18	
			DNF = 0		
			Analog filter disabled	16	
DNF = 1					

The SDA and SCL I/O requirements are met with the following restrictions: the SDA and SCL I/O pins are not “true” open-drain. When configured as open-drain, the PMOS connected between the I/O pin and V<sub>DDIO1</sub> is disabled, but is still present. Only FT\_f I/O pins support Fm+ low-level output current maximum requirement. Refer to [Section 5.3.14: I/O port characteristics](#) for the I2C I/Os characteristics.

All I2C SDA and SCL I/Os embed an analog filter. Refer to the following table for its characteristics:

**Table 74. I2C analog filter characteristics<sup>(1)</sup>**

Symbol	Parameter	Min	Max	Unit
t <sub>AF</sub>	Limiting duration of spikes suppressed by the filter <sup>(2)</sup>	50	260	ns

1. Based on characterization results, not tested in production.
2. Spikes shorter than the limiting duration are suppressed.

### SPI/I<sup>2</sup>S characteristics

Unless otherwise specified, the parameters given in [Table 75](#) for SPI are derived from tests performed under the ambient temperature, f<sub>PCLKx</sub> frequency and supply voltage conditions summarized in [Table 24: General operating conditions](#). The additional general conditions are:

- OSPEEDRy[1:0] set to 11 (output speed)
- capacitive load C = 30 pF
- measurement points at CMOS levels: 0.5 x V<sub>DD</sub>

Refer to [Section 5.3.14: I/O port characteristics](#) for more details on the input/output alternate function characteristics (NSS, SCK, MOSI, MISO for SPI).

Table 75. SPI characteristics<sup>(1)</sup>

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$f_{SCK}$ $1/t_{c(SCK)}$	SPI clock frequency	Master mode $1.65 < V_{DD} < 3.6 \text{ V}$ Range 1	-	-	32	MHz
		Master transmitter $1.65 < V_{DD} < 3.6 \text{ V}$ Range 1			32	
		Slave receiver $1.65 < V_{DD} < 3.6 \text{ V}$ Range 1			32	
		Slave transmitter/full duplex $2.7 < V_{DD} < 3.6 \text{ V}$ Range 1			32	
		Slave transmitter/full duplex $1.65 < V_{DD} < 3.6 \text{ V}$ Range 1			23	
		$1.65 < V_{DD} < 3.6 \text{ V}$ Range 2			8	
$t_{su(NSS)}$	NSS setup time	Slave mode, SPI prescaler = 2	$4 \times T_{PCLK}$	-	-	ns
$t_{h(NSS)}$	NSS hold time	Slave mode, SPI prescaler = 2	$2 \times T_{PCLK}$	-	-	ns
$t_{w(SCKH)}$	SCK high time	Master mode	$T_{PCLK} - 1.5$	$T_{PCLK}$	$T_{PCLK} + 1.5$	ns
$t_{w(SCKL)}$	SCK low time	Master mode	$T_{PCLK} - 1.5$	$T_{PCLK}$	$T_{PCLK} + 1.5$	ns
$t_{su(MI)}$	Master data input setup time	-	1	-	-	ns
$t_{su(SI)}$	Slave data input setup time	-	1	-	-	ns
$t_{h(MI)}$	Master data input hold time	-	5	-	-	ns
$t_{h(SI)}$	Slave data input hold time	-	1	-	-	ns
$t_{a(SO)}$	Data output access time	Slave mode	9	-	34	ns
$t_{dis(SO)}$	Data output disable time	Slave mode	9	-	16	ns
$t_{v(SO)}$	Slave data output valid time	$2.7 < V_{DD} < 3.6 \text{ V}$ Range 1	-	9	14	ns
		$1.65 < V_{DD} < 3.6 \text{ V}$ Range 1	-	9	21	
		$1.65 < V_{DD} < 3.6 \text{ V}$ Voltage Range 2	-	11	24	
$t_{v(MO)}$	Master data output valid time	-	-	3	5	ns

Table 75. SPI characteristics<sup>(1)</sup> (continued)

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$t_{h(SO)}$	Slave data output hold time	-	5	-	-	ns
$t_{h(MO)}$	Master data output hold time	-	1	-	-	ns

1. Based on characterization results, not tested in production.

Figure 31. SPI timing diagram - slave mode and CPHA = 0

Figure 32. SPI timing diagram - slave mode and CPHA = 1

1. Measurement points are done at CMOS levels: 0.3 V<sub>DD</sub> and 0.7 V<sub>DD</sub>.

Figure 33. SPI timing diagram - master mode

1. Measurement points are set at CMOS levels: 0.3  $V_{DD}$  and 0.7  $V_{DD}$ .

Table 76. I<sup>2</sup>S characteristics<sup>(1)</sup>

Symbol	Parameter	Conditions	Min	Max	Unit
$f_{MCK}$	I2S main clock output	$f_{MCK} = 256 \times F_s$ ; ( $F_s$ = audio sampling frequency) $F_{s_{min}} = 8 \text{ kHz}$ ; $F_{s_{max}} = 192 \text{ kHz}$ ;	2.048	49.152	MHz
$f_{CK}$	I2S clock frequency	Master data	-	$64 \times F_s$	MHz
		Slave data	-	$64 \times F_s$	
$D_{CK}$	I2S clock frequency duty cycle	Slave receiver	30	70	%

Table 76. I<sup>2</sup>S characteristics<sup>(1)</sup> (continued)

1. Based on characterization results, not tested in production.

Figure 34. I<sup>2</sup>S slave timing diagram (Philips protocol)

1. Measurement points are done at CMOS levels:  $0.3 V_{DDIO1}$  and  $0.7 V_{DDIO1}$ .
2. LSB transmit/receive of the previously transmitted byte. No LSB transmit/receive is sent before the first byte.

Figure 35. I<sup>2</sup>S master timing diagram (Philips protocol)

MSv39720V1

1. Based on characterization results, not tested in production.
2. LSB transmit/receive of the previously transmitted byte. No LSB transmit/receive is sent before the first byte.

**USART characteristics**

Unless otherwise specified, the parameters given in [Table 77](#) for USART are derived from tests performed under the ambient temperature,  $f_{PCLKx}$  frequency and supply voltage conditions summarized in [Table 24: General operating conditions](#). The additional general conditions are:

- OSPEEDRy[1:0] set to 10 (output speed)
- capacitive load C = 30 pF
- measurement points at CMOS levels:  $0.5 \times V_{DD}$

Refer to [Section 5.3.14: I/O port characteristics](#) for more details on the input/output alternate function characteristics (NSS, CK, TX, and RX for USART).

**Table 77. USART characteristics**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$f_{CK}$	USART clock frequency	Master mode	-	-	8	MHz
		Slave mode	-	-	21	

Table 77. USART characteristics

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$t_{su(NSS)}$	NSS setup time	Slave mode	$t_{ker} + 2$	-	-	ns
$t_{h(NSS)}$	NSS hold time	Slave mode	2	-	-	
$t_{w(CKH)}$	CK high time	Master mode	$1 / f_{CK} / 2 - 1$	$1 / f_{CK} / 2$	$1 / f_{CK} / 2 + 1$	
$t_{w(CKL)}$	CK low time					
$t_{su(RX)}$	Data input setup time	Master mode	$t_{ker} + 2$	-	-	
		Slave mode	4	-	-	
$t_{h(RX)}$	Data input hold time	Master mode	1	-	-	
		Slave mode	0.5	-	-	
$t_{v(TX)}$	Data output valid time	Master mode	-	0.5	1	
		Slave mode	-	10	19	
$t_{h(TX)}$	Data output hold time	Master mode	0	-	-	
		Slave mode	7	-	-	

**USB full speed (FS) characteristics**

The STM32G0B1xB/xC/xE USB interface is fully compliant with the USB specification version 2.0 and is USB-IF certified (for Full-speed device operation).

Table 78. USB DC electrical characteristics

Symbol	Parameter	Conditions	Min <sup>(1)</sup>	Typ	Max <sup>(1)</sup>	Unit
$V_{DDUSB}$	USB full speed transceiver operating voltage	-	3.0 <sup>(2)</sup>	-	3.6	V
$V_{DI}^{(3)}$	Differential input sensitivity	Over VCM range	0.2	-	-	V
$V_{CM}^{(3)}$	Differential input common mode range	Includes $V_{DI}$ range	0.8	-	2.5	
$V_{SE}^{(3)}$	Single ended receiver input threshold	-	0.8	-	2.0	
$V_{OL}$	Static output level low	$R_L$ of 1.5 kΩ to 3.6 V <sup>(4)</sup>	-	-	0.3	V
$V_{OH}$	Static output level high	$R_L$ of 15 kΩ to $V_{SS}^{(4)}$	2.8	-	3.6	
$R_{PD}^{(3)}$	Pull down resistor on PA11, PA12 (USB_FS_DP/DM)	$V_{IN} = V_{DD}$	14.25	-	24.8	kΩ
$R_{PU}^{(3)}$	Pull Up Resistor on PA12 (USB_FS_DP)	$V_{IN} = V_{SS}$ , during idle	0.9	1.25	1.575	kΩ
	Pull Up Resistor on PA12 (USB_FS_DP)	$V_{IN} = V_{SS}$ during reception	1.425	2.25	3.09	kΩ

1. All the voltages are measured from the local ground potential.
2. The USB full speed transceiver functionality is ensured down to 2.7 V but not the full USB full speed electrical characteristics which are degraded in the 2.7-to-3.0 V  $V_{DD}$  voltage range.
3. Guaranteed by design.
4.  $R_L$  is the load connected on the USB full speed drivers.

Note: When VBUS sensing feature is enabled, PA9 should be left at its default state (floating input), not as alternate function. A typical 200  $\mu$ A current consumption of the sensing block (current to voltage conversion to determine the different sessions) can be observed on PA9 when the feature is enabled.

Figure 36. USB timings – definition of data signal rise and fall time

Table 79. USB electrical characteristics<sup>(1)</sup>

Driver characteristics					
Symbol	Parameter	Conditions	Min	Max	Unit
$t_{rLS}$	Rise time in LS <sup>(2)</sup>	$C_L = 200$ to $600$ pF	75	300	ns
$t_{fLS}$	Fall time in LS <sup>(2)</sup>	$C_L = 200$ to $600$ pF	75	300	ns
$t_{rfmLS}$	Rise/ fall time matching in LS	$t_r/t_f$	80	125	%
$t_{rFS}$	Rise time in FS <sup>(2)</sup>	$C_L = 50$ pF	4	20	ns
$t_{fFS}$	Fall time in FS <sup>(2)</sup>	$C_L = 50$ pF	4	20	ns
$t_{rfmFS}$	Rise/ fall time matching in FS	$t_r/t_f$	90	111	%
$V_{CRS}$	Output signal crossover voltage (LS/FS)	-	1.3	2.0	V
$Z_{DRV}$	Output driver impedance <sup>(3)</sup>	Driving high or low	28	44	$\Omega$

1. Guaranteed by design.
2. Measured from 10% to 90% of the data signal. For more detailed informations, please refer to USB Specification - Chapter 7 (version 2.0).
3. No external termination series resistors are required on DP (D+) and DM (D-) pins since the matching impedance is included in the embedded driver.

Table 80. USB BCD DC electrical characteristics<sup>(1)</sup>

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Unit
$I_{DD(USBBCD)}$	Primary detection mode consumption	-	-	-	300	$\mu$ A
	Secondary detection mode consumption	-	-	-	300	$\mu$ A

Table 80. USB BCD DC electrical characteristics<sup>(1)</sup> (continued)

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Unit
RDAT_LKG	Data line leakage resistance	-	300	-	-	kΩ
VDAT_LKG	Data line leakage voltage	-	0.0	-	3.6	V
RDCP_DAT	Dedicated charging port resistance across D+/D-	-	-	-	200	Ω
VLGC_HI	Logic high	-	2.0	-	3.6	V
VLGC_LOW	Logic low	-	-	-	0.8	V
VLGC	Logic threshold	-	0.8	-	2.0	V
VDAT_REF	Data detect voltage	-	0.25	-	0.4	V
VDP_SRC	D+ source voltage	-	0.5	-	0.7	V
VDM_SRC	D- source voltage	-	0.5	-	0.7	V
IDP_SINK	D+ sink current	-	25	-	175	μA
IDM_SINK	D- sink current	-	25	-	175	μA

1. Guaranteed by design.

**CAN (controller area network) interface**

Refer to [Section 5.3.14: I/O port characteristics](#) for more details on the input/output alternate function characteristics (FDCANx\_TX and FDCANx\_RX).

**5.3.25 UCPD characteristics**

UCPD1 and UCPD2 controllers comply with USB Type-C Rev.1.2 and USB Power Delivery Rev. 3.0 specifications.

Table 81. UCPD operating conditions

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
V <sub>DD</sub>	UCPD operating supply voltage	Sink mode only	3.0	3.3	3.6	V
		Sink and source mode	3.135	3.3	3.465	V

## 6 Package information

In order to meet environmental requirements, ST offers these devices in different grades of ECOPACK packages, depending on their level of environmental compliance. ECOPACK specifications, grade definitions and product status are available at: [www.st.com](http://www.st.com). ECOPACK is an ST trademark.

### 6.1 UFQFPN32 package information

UFQFPN32 is a 32-pin, 5x5 mm, 0.5 mm pitch ultra-thin fine-pitch quad flat package.

Figure 37. UFQFPN32 package outline

1. Drawing is not to scale.
2. There is an exposed die pad on the underside of the UFQFPN package. It is recommended to connect and solder this backside pad to PCB ground.

Table 82. UFQFPN32 package mechanical data

Symbol	millimeters			inches <sup>(1)</sup>		
	Min	Typ	Max	Min	Typ	Max
A	0.500	0.550	0.600	0.0197	0.0217	0.0236

e	-	0.500	-	-	0.0197	-
L	0.300	0.400	0.500	0.0118	0.0157	0.0197
ddd	-	-	0.080	-	-	0.0031

1. Values in inches are converted from mm and rounded to 4 decimal digits.
2. Dimensions D and E do not include mold protrusion, not to exceed 0,15mm.

Figure 38. Recommended footprint for UFQFPN32 package

1. Dimensions are expressed in millimeters

**Device marking**

The following figure gives an example of topside marking orientation versus pin 1 identifier location.

The printed markings may differ depending on the supply chain.

Other optional marking or inset/upset marks, which identify the parts throughout supply chain operations, are not indicated below.

**Figure 39. UFQFPN32 package marking example**

1. Parts marked as ES or E or accompanied by an Engineering Sample notification letter are not yet qualified and therefore not approved for use in production. ST is not responsible for any consequences resulting from such use. In no event will ST be liable for the customer using any of these engineering samples in production. ST's Quality department must be contacted prior to any decision to use these engineering samples to run a qualification activity.

## 6.2 LQFP32 package information

LQFP32 is a 32-pin, 7 x 7 mm low-profile quad flat package.

Figure 40. LQFP32 package outline

1. Drawing is not to scale.

Table 83. LQFP32 mechanical data

Symbol	millimeters			inches <sup>(1)</sup>		
	Min	Typ	Max	Min	Typ	Max

1. Values in inches are converted from mm and rounded to 4 decimal digits.

Figure 41. Recommended footprint for LQFP32 package

1. Dimensions are expressed in millimeters.

### Device marking

The following figure gives an example of topside marking orientation versus pin 1 identifier location.

The printed markings may differ depending on the supply chain.

Other optional marking or inset/upset marks, which identify the parts throughout supply chain operations, are not indicated below.

**Figure 42. LQFP32 package marking example**

1. Parts marked as ES or E or accompanied by an Engineering Sample notification letter are not yet qualified and therefore not approved for use in production. ST is not responsible for any consequences resulting from such use. In no event will ST be liable for the customer using any of these engineering samples in production. ST's Quality department must be contacted prior to any decision to use these engineering samples to run a qualification activity.

### 6.3 UFQFPN48 package information

UFQFPN48 is a 48-lead, 7x7 mm, 0.5 mm pitch, ultra-thin fine-pitch quad flat package

Figure 43. UFQFPN48 package outline

1. Drawing is not to scale.
2. All leads/pads should also be soldered to the PCB to improve the lead/pad solder joint life.
3. There is an exposed die pad on the underside of the UFQFPN package. It is recommended to connect and solder this back-side pad to PCB ground.

Table 84. UFQFPN48 package mechanical data

Symbol	millimeters			inches <sup>(1)</sup>		
	Min	Typ	Max	Min	Typ	Max
A	0.500	0.550	0.600	0.0197	0.0217	0.0236

## 6.11 Thermal characteristics

The operating junction temperature  $T_J$  must never exceed the maximum given in [Table 24: General operating conditions](#).

The maximum junction temperature in °C that the device can reach if respecting the operating conditions, is:

$$T_J(\text{max}) = T_A(\text{max}) + P_D(\text{max}) \times \Theta_{JA}$$

where:

- $T_A(\text{max})$  is the maximum operating ambient temperature in °C,
- $\Theta_{JA}$  is the package junction-to-ambient thermal resistance, in °C/W,
- $P_D = P_{INT} + P_{I/O}$ .
  - $P_{INT}$  is power dissipation contribution from product of  $I_{DD}$  and  $V_{DD}$
  - $P_{I/O}$  is power dissipation contribution from output ports where:  
 $P_{I/O} = \sum (V_{OL} \times I_{OL}) + \sum ((V_{DDIO1} - V_{OH}) \times I_{OH})$ ,  
 taking into account the actual  $V_{OL} / I_{OL}$  and  $V_{OH} / I_{OH}$  of the I/Os at low and high level in the application.

**Table 95. Package thermal characteristics**

Symbol	Parameter	Package	Value			Unit
			Junction-to-ambient	Junction-to-board	Junction-to-case	
Θ	Thermal resistance	LQFP100 14 × 14 mm	47	23	9	°C/W
		UFBGA100 7 × 7 mm	48	30	12	
		LQFP80 12 × 12 mm	51	24	10

### 6.11.1 Reference document

JESD51-2 Integrated Circuits Thermal Test Method Environment Conditions - Natural Convection (still air). Available from [www.jedec.org](http://www.jedec.org).

### 6.11.2 Selecting the product temperature range

The temperature range is specified in the ordering information scheme shown in [Section 7: Ordering information](#).

Each temperature range suffix corresponds to a specific guaranteed ambient temperature at maximum dissipation and to a specific maximum junction temperature.

As applications do not commonly use microcontrollers at their maximum power consumption, it is useful to calculate the exact power consumption and junction temperature to determine which temperature range best suits the application.

The following example shows how to calculate the temperature range needed for a given application.

**Example:**

Assuming the following worst application conditions:

- ambient temperature  $T_A = 50\text{ °C}$  (measured according to JESD51-2)
- $I_{DD} = 50\text{ mA}$ ;  $V_{DD} = 3.6\text{ V}$
- 20 I/Os simultaneously used as output at low level with  $I_{OL} = 8\text{ mA}$  ( $V_{OL} = 0.4\text{ V}$ ), and
- 8 I/Os simultaneously used as output at low level with  $I_{OL} = 20\text{ mA}$  ( $V_{OL} = 1.3\text{ V}$ ),

the power consumption from power supply  $P_{INT}$  is:

$$P_{INT} = 50\text{ mA} \times 3.6\text{ V} = 180\text{ mW},$$

the power loss through I/Os  $P_{IO}$  is

$$P_{IO} = 20 \times 8\text{ mA} \times 0.4\text{ V} + 8 \times 20\text{ mA} \times 1.3\text{ V} = 272\text{ mW},$$

and the total power  $P_D$  to dissipate is:

$$P_D = 180\text{ mW} + 272\text{ mW} = 452\text{ mW}$$

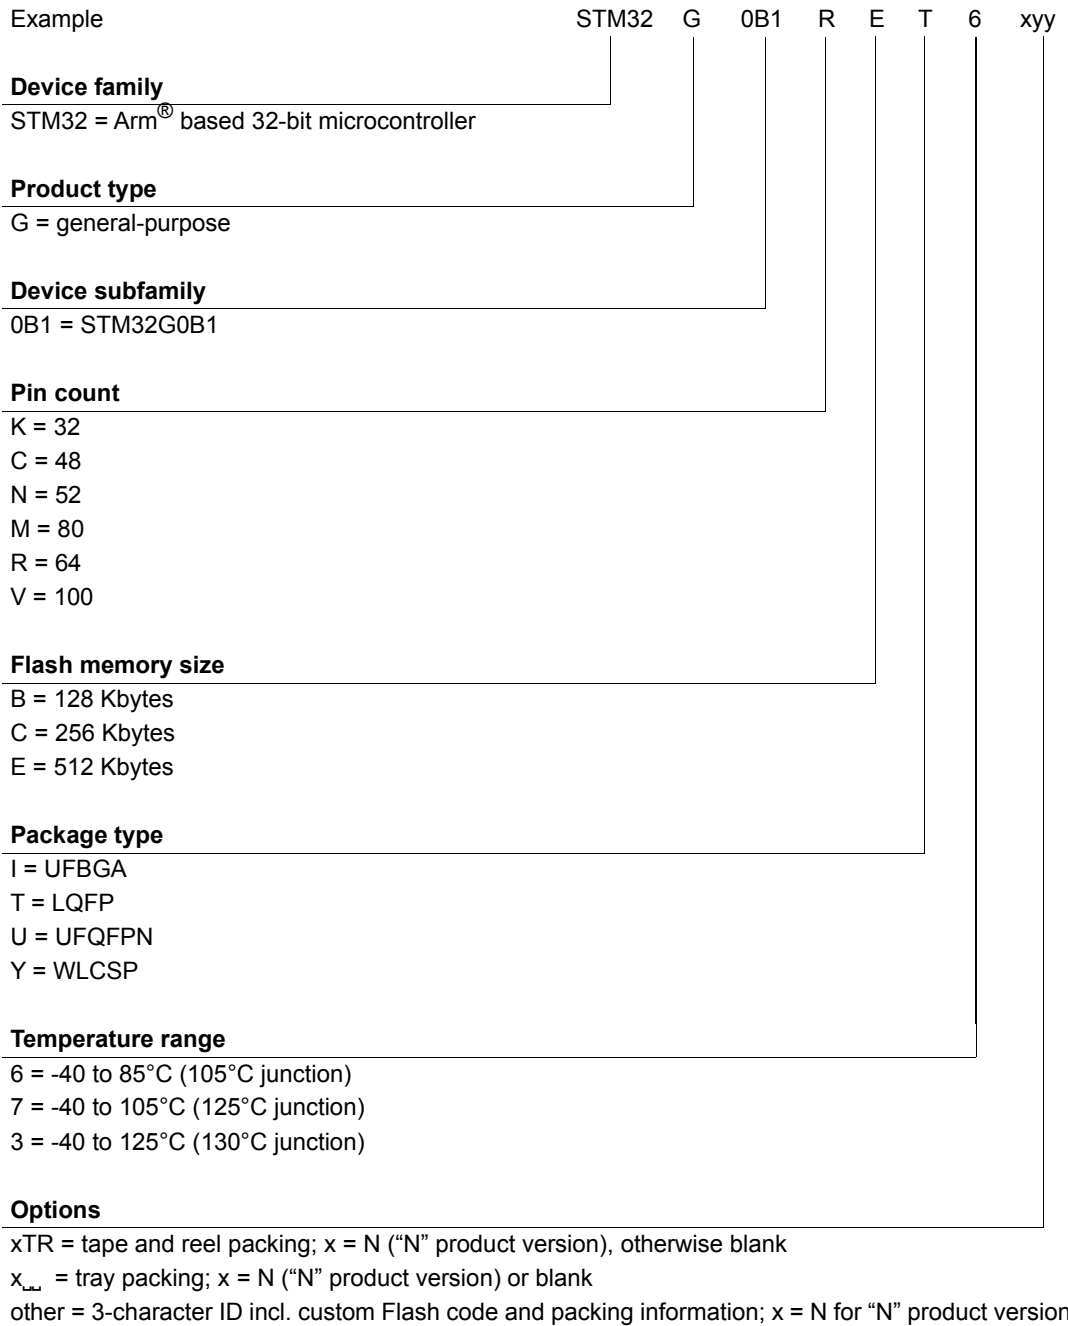

For a package with  $\Theta_{JA} = 65\text{ °C/W}$ , the junction temperature stabilizes at:

$$T_J = 50\text{ °C} + (65\text{ °C/W} \times 452\text{ mW}) = 50\text{ °C} + 29.4\text{ °C} = 79.4\text{ °C}$$

As a conclusion, product version with suffix 6 (maximum allowed  $T_J = 105\text{ °C}$ ) is sufficient for this application.

If the same application was used in a hot environment with maximum  $T_A$  greater than  $75.5\text{ °C}$ , the junction temperature would exceed  $105\text{ °C}$  and the product version allowing higher maximum  $T_J$  would have to be ordered.

# 7 Ordering information

For a list of available options (memory, package, and so on) or for further information on any aspect of this device, please contact your nearest ST sales office.
