

Dual 32-bit Arm<sup>®</sup> Cortex<sup>®</sup>-M7 up to 480MHz and -M4 MCUs, up to 2MB Flash, 1MB RAM, 46 com. and analog interfaces, SMPS

Datasheet - production data

## Features

### Dual core

- 32-bit Arm<sup>®</sup> Cortex<sup>®</sup>-M7 core with double-precision FPU and L1 cache: 16 Kbytes of data and 16 Kbytes of instruction cache; frequency up to 480 MHz, MPU, 1027 DMIPS/2.14 DMIPS/MHz (Dhystone 2.1), and DSP instructions
- 32-bit Arm<sup>®</sup> Cortex<sup>®</sup>-M4 core with FPU, Adaptive real-time accelerator (ART Accelerator<sup>™</sup>) for internal Flash memory and external memories, frequency up to 240 MHz, MPU, 300 DMIPS/1.25 DMIPS /MHz (Dhystone 2.1), and DSP instructions

### Memories

- Up to 2 Mbytes of Flash memory with read-while-write support
- 1 Mbyte of RAM: 192 Kbytes of TCM RAM (inc. 64 Kbytes of ITCM RAM + 128 Kbytes of DTCM RAM for time critical routines), 864 Kbytes of user SRAM, and 4 Kbytes of SRAM in Backup domain
- Dual mode Quad-SPI memory interface running up to 133 MHz
- Flexible external memory controller with up to 32-bit data bus: SRAM, PSRAM, SDRAM/LPDDR SDRAM, NOR/NAND Flash memory clocked up to 125 MHz in Synchronous mode
- CRC calculation unit

### Security

- ROP, PC-ROP, active tamper

### General-purpose input/outputs

- Up to 168 I/O ports with interrupt capability

### Reset and power management

- 3 separate power domains which can be independently clock-gated or switched off:
  - D1: high-performance capabilities
  - D2: communication peripherals and timers
  - D3: reset/clock control/power management
- 1.62 to 3.6 V application supply and I/Os
- POR, PDR, PVD and BOR
- Dedicated USB power embedding a 3.3 V internal regulator to supply the internal PHYs
- Embedded regulator (LDO) to supply the digital circuitry
- High power-efficiency SMPS step-down converter regulator to directly supply  $V_{CORE}$  and/or external circuitry
- Voltage scaling in Run and Stop mode (6 configurable ranges)
- Backup regulator (~0.9 V)
- Voltage reference for analog peripheral/ $V_{REF+}$
- 1.2 to 3.6 V  $V_{BAT}$  supply
- Low-power modes: Sleep, Stop, Standby and  $V_{BAT}$  supporting battery charging

### Low-power consumption

- $V_{BAT}$  battery operating mode with charging capability
- CPU and domain power state monitoring pins
- 2.95  $\mu$ A in Standby mode (Backup SRAM OFF, RTC/LSE ON)

### Clock management

- Internal oscillators: 64 MHz HSI, 48 MHz HSI48, 4 MHz CSI, 32 kHz LSI
- External oscillators: 4-48 MHz HSE, 32.768 kHz LSE
- 3× PLLs (1 for the system clock, 2 for kernel clocks) with Fractional mode

### Interconnect matrix

- 3 bus matrices (1 AXI and 2 AHB)
- Bridges (5× AHB2-APB, 2× AXI2-AHB)

### 4 DMA controllers to unload the CPU

- 1× high-speed master direct memory access controller (MDMA) with linked list support
- 2× dual-port DMAs with FIFO
- 1× basic DMA with request router capabilities

### Up to 35 communication peripherals

- 4× I2Cs FM+ interfaces (SMBus/PMBus)
- 4× USARTs/4x UARTs (ISO7816 interface, LIN, IrDA, up to 12.5 Mbit/s) and 1x LPUART
- 6× SPIs, 3 with muxed duplex I2S audio class accuracy via internal audio PLL or external clock, 1x I2S in LP domain (up to 150 MHz)
- 4x SAIs (serial audio interface)
- SPDIFRX interface
- SWPMI single-wire protocol master I/F
- MDIO Slave interface
- 2× SD/SDIO/MMC interfaces (up to 125 MHz)
- 2× CAN controllers: 2 with CAN FD, 1 with time-triggered CAN (TT-CAN)
- 2× USB OTG interfaces (1FS, 1HS/FS) crystal-less solution with LPM and BCD
- Ethernet MAC interface with DMA controller
- HDMI-CEC
- 8- to 14-bit camera interface (up to 80 MHz)

### 11 analog peripherals

- 3× ADCs with 16-bit max. resolution (up to 36 channels, up to 3.6 MSPS)
- 1× temperature sensor
- 2× 12-bit D/A converters (1 MHz)
- 2× ultra-low-power comparators

- 2× operational amplifiers (7.3 MHz bandwidth)
- 1× digital filters for sigma delta modulator (DFSDM) with 8 channels/4 filters

### Graphics

- LCD-TFT controller up to XGA resolution
- Chrom-ART graphical hardware Accelerator™ (DMA2D) to reduce CPU load
- Hardware JPEG Codec

### Up to 22 timers and watchdogs

- 1× high-resolution timer (2.1 ns max resolution)
- 2× 32-bit timers with up to 4 IC/OC/PWM or pulse counter and quadrature (incremental) encoder input (up to 240 MHz)
- 2× 16-bit advanced motor control timers (up to 240 MHz)
- 10× 16-bit general-purpose timers (up to 240 MHz)
- 5× 16-bit low-power timers (up to 240 MHz)
- 4× watchdogs (independent and window)
- 2× SysTick timers
- RTC with sub-second accuracy and hardware calendar

### Debug mode

- SWD & JTAG interfaces
- 4-Kbyte Embedded Trace Buffer

### True random number generators (3 oscillators each)

### 96-bit unique ID

### Optional support of extended temperature range up to 125 °C (specific part numbers)

### All packages are ECOPACK® 2 compliant

Table 1. Device summary

Reference	Part number
STM32H745xI	STM32H745ZI, STM32H745II, STM32H745BI, STM32H745XI
STM32H745xG	STM32H745ZG, STM32H745IG, STM32H745BG, STM32H745XG

# 1 Introduction

This document provides information on STM32H745xI/G microcontrollers, such as description, functional overview, pin assignment and definition, electrical characteristics, packaging, and ordering information.

This document should be read in conjunction with the STM32H745xI/G reference manual (RM0399), available from the STMicroelectronics website [www.st.com](http://www.st.com).

For information on the Arm<sup>®(a)</sup> Cortex<sup>®</sup>-M7 core and Arm<sup>®</sup> Cortex<sup>®</sup>-M4 core, please refer to the Cortex<sup>®</sup>-M7 Technical Reference Manual, available from the <http://www.arm.com> website.

The logo for Arm, consisting of the word "arm" in a lowercase, bold, sans-serif font.

a. Arm is a registered trademark of Arm Limited (or its subsidiaries) in the US and/or elsewhere.

## 2 Description

STM32H745xI/G devices are based on the high-performance Arm® Cortex®-M7 and Cortex®-M4 32-bit RISC cores. The Cortex®-M7 core operates at up to 480 MHz and the Cortex®-M4 core at up to 240 MHz. Both cores feature a floating point unit (FPU) which supports Arm® single- and double-precision (Cortex®-M7 core) operations and conversions (IEEE 754 compliant), including a full set of DSP instructions and a memory protection unit (MPU) to enhance application security.

STM32H745xI/G devices incorporate high-speed embedded memories with a dual-bank Flash memory of up to 2 Mbytes, up to 1 Mbyte of RAM (including 192 Kbytes of TCM RAM, up to 864 Kbytes of user SRAM and 4 Kbytes of backup SRAM), as well as an extensive range of enhanced I/Os and peripherals connected to APB buses, AHB buses, 2x32-bit multi-AHB bus matrix and a multi layer AXI interconnect supporting internal and external memory access.

All the devices offer three ADCs, two DACs, two ultra-low power comparators, a low-power RTC, a high-resolution timer, 12 general-purpose 16-bit timers, two PWM timers for motor control, five low-power timers, a true random number generator (RNG). The devices support four digital filters for external sigma-delta modulators (DFSDM). They also feature standard and advanced communication interfaces.

- Standard peripherals
  - Four I<sup>2</sup>Cs
  - Four USARTs, four UARTs and one LPUART
  - Six SPIs, three I<sup>2</sup>Ss in Half-duplex mode. To achieve audio class accuracy, the I<sup>2</sup>S peripherals can be clocked by a dedicated internal audio PLL or by an external clock to allow synchronization.
  - Four SAI serial audio interfaces
  - One SPDIFRX interface
  - One SWPMI (Single Wire Protocol Master Interface)
  - Management Data Input/Output (MDIO) slaves
  - Two SDMMC interfaces
  - A USB OTG full-speed and a USB OTG high-speed interface with full-speed capability (with the ULPI)
  - One FDCAN plus one TT-FDCAN interface
  - An Ethernet interface
  - Chrom-ART Accelerator™
  - HDMI-CEC
- Advanced peripherals including
  - A flexible memory control (FMC) interface
  - A Quad-SPI Flash memory interface
  - A camera interface for CMOS sensors
  - An LCD-TFT display controller
  - A JPEG hardware compressor/decompressor

Refer to [Table 2: STM32H745xI/G features and peripheral counts](#) for the list of peripherals available on each part number.

STM32H745xI/G devices operate in the  $-40$  to  $+85$  °C temperature range from a 1.62 to 3.6 V power supply. The supply voltage can drop down to 1.62 V by using an external power supervisor (see [Section 3.5.2: Power supply supervisor](#)) and connecting the PDR\_ON pin to  $V_{SS}$ . Otherwise the supply voltage must stay above 1.71 V with the embedded power voltage detector enabled.

Dedicated supply inputs for USB (OTG\_FS and OTG\_HS) are available on all packages to allow a greater power supply choice.

A comprehensive set of power-saving modes allows the design of low-power applications.

STM32H745xI/G devices are offered in 5 packages ranging from 144 pins to 240 pins/balls. The set of included peripherals changes with the device chosen.

These features make STM32H745xI/G microcontrollers suitable for a wide range of applications:

- Motor drive and application control
- Medical equipment
- Industrial applications: PLC, inverters, circuit breakers
- Printers, and scanners
- Alarm systems, video intercom, and HVAC
- Home audio appliances
- Mobile applications, Internet of Things
- Wearable devices: smart watches.

[Figure 1](#) shows the device block diagram.

1. The SPI1, SPI2 and SPI3 interfaces give the flexibility to work in an exclusive way in either the SPI mode or the I2S audio mode.
2. The product junction temperature must be kept within the -40 to +105 °C range.
3. The product junction temperature must be kept within the -40 to +125 °C range.
4. Up to 300 MHz for STM32H745xxx3 sales types (extended industrial temperature range).
5.  $V_{DD}/V_{DDA}$  can drop down to 1.62 V by using an external power supervisor (see [Section 3.5.2: Power supply supervisor](#)) and connecting PDR\_ON pin to  $V_{SS}$ . Otherwise the supply voltage must stay above 1.71 V with the embedded power voltage detector enabled.
6. Using appropriate cooling methods to guarantee that the maximum junction temperature (125 °C) is not exceeded, the maximum ambient temperature (85 °C) can be exceeded.
7. The product junction temperature must be kept within the -40 to +140 °C range.
8. It is mandatory to use the SMPS step-down converter when the maximum junction temperature is higher than 125 °C.

Figure 1. STM32H745xI/G block diagram

### Compatibility throughout the family

STM32H745xI/G devices are not pin-to-pin compatible with STM32H7x3 devices (single core line):

- The TFBGA240+25 ballout is compatible with STM32H7x3 devices, except for a few I/O balls as shown in [Figure 2](#).
- LQFP208 and LQFP176 pinouts, as well as UFBGA176+25 ballout are not compatible with STM32H7x3 devices.

**Figure 2. TFBGA240+25 ball assignment differences**

## 3 Functional overview

### 3.1 Dual Arm® Cortex® cores

The industrial STM32H745xI/G devices embed two Arm® cores, a Cortex®-M7 and a Cortex®-M4. The Cortex®-M4 offers optimal performance for real-time applications while the Cortex®-M7 core can execute high-performance tasks in parallel.

The two cores belong to separate power domains. This allows designing gradual high-power efficiency solutions in combination with the low-power modes already available on all STM32 microcontrollers.

#### 3.1.1 Arm® Cortex®-M7 with FPU

The Arm® Cortex®-M7 with double-precision FPU processor is the latest generation of Arm processors for embedded systems. It was developed to provide a low-cost platform that meets the needs of MCU implementation, with a reduced pin count and optimized power consumption, while delivering outstanding computational performance and low interrupt latency.

The Cortex®-M7 processor is a highly efficient high-performance featuring:

- Six-stage dual-issue pipeline
- Dynamic branch prediction
- Harvard architecture with L1 caches (16 Kbytes of I-cache and 16 Kbytes of D-cache)
- 64-bit AXI interface
- 64-bit ITCM interface
- 2x32-bit DTCM interfaces

The following memory interfaces are supported:

- Separate Instruction and Data buses (Harvard Architecture) to optimize CPU latency
- Tightly Coupled Memory (TCM) interface designed for fast and deterministic SRAM accesses
- AXI Bus interface to optimize Burst transfers
- Dedicated low-latency AHB-Lite peripheral bus (AHBP) to connect to peripherals.

The processor supports a set of DSP instructions which allow efficient signal processing and complex algorithm execution.

It also supports single and double precision FPU (floating point unit) speeds up software development by using metalanguage development tools, while avoiding saturation.

*Figure 1* shows the general block diagram of the STM32H745xI/G family.

*Note:* Cortex®-M7 with FPU core is binary compatible with the Cortex®-M4 core.

### 3.1.2 Arm<sup>®</sup> Cortex<sup>®</sup>-M4 with FPU

The Arm<sup>®</sup> Cortex<sup>®</sup>-M4 processor is a high-performance embedded processor which supports DSP instructions. It was developed to provide an optimized power consumption MCU, while delivering outstanding computational performance and low interrupt latency.

The Arm<sup>®</sup> Cortex<sup>®</sup>-M4 processor is a highly efficient MCU featuring:

- 3-stage pipeline with branch prediction
- Harvard architecture
- 32-bit System (S-BUS) interface
- 32-bit I-BUS interface
- 32-bit D-BUS interface

The Arm<sup>®</sup> Cortex<sup>®</sup>-M4 processor also features a dedicated hardware adaptive real-time accelerator (ART Accelerator<sup>™</sup>). This is an instruction cache memory composed of sixty-four 256-bit lines, a 256-bit cache buffer connected to the 64-bit AXI interface and a 32-bit interface for non-cacheable accesses.

## 3.2 Memory protection unit (MPU)

The devices feature two memory protection units. Each MPU manages the CPU access rights and the attributes of the system resources. It has to be programmed and enabled before use. Its main purposes are to prevent an untrusted user program to accidentally corrupt data used by the OS and/or by a privileged task, but also to protect data processes or read-protect memory regions.

The MPU defines access rules for privileged accesses and user program accesses. It allows defining up to 16 protected regions that can in turn be divided into up to 8 independent subregions, where region address, size, and attributes can be configured. The protection area ranges from 32 bytes to 4 Gbytes of addressable memory.

When an unauthorized access is performed, a memory management exception is generated.

## 3.3 Memories

### 3.3.1 Embedded Flash memory

The STM32H745xI/G devices embed up to 2 Mbytes of Flash memory that can be used for storing programs and data.

The Flash memory is organized as 266-bit Flash words memory that can be used for storing both code and data constants. Each word consists of:

- One Flash word (8 words, 32 bytes or 256 bits)
- 10 ECC bits.

The Flash memory is divided into two independent banks. Each bank is organized as follows:

- A user Flash memory block of 512 Kbytes (STM32H7xxxG) or 1-Mbyte (STM32H7xxxl) containing eight user sectors of 128 Kbytes (4 K Flash memory words)
- 128 Kbytes of System Flash memory from which the device can boot
- 2 Kbytes (64 Flash words) of user option bytes for user configuration

### 3.3.2 Embedded SRAM

All devices feature around 1 Mbyte of RAM with hardware ECC. The RAM is divided as follows:

- 512 Kbytes of AXI-SRAM mapped onto AXI bus on D1 domain.
- SRAM1 mapped on D2 domain: 128 Kbytes
- SRAM2 mapped on D2 domain: 128 Kbytes
- SRAM3 mapped on D2 domain: 32 Kbytes
- SRAM4 mapped on D3 domain: 64 Kbytes
- 4 Kbytes of backup SRAM

The content of this area is protected against possible unwanted write accesses, and is retained in Standby or  $V_{BAT}$  mode.

- RAM mapped to TCM interface (ITCM and DTCM):

Both ITCM and DTCM RAMs are 0 wait state memories. They can be accessed either from the Arm<sup>®</sup> Cortex<sup>®</sup>-M7 CPU or the MDMA (even in Sleep mode) through a specific AHB slave of the Cortex<sup>®</sup>-M7(AHBS):

- 64 Kbytes of ITCM-RAM (instruction RAM)
- 128 Kbytes of DTCM-RAM (2x 64-Kbyte DTCM-RAMs on 2x32-bit DTCM ports)

The DTCM-RAM could be used for critical real-time data, such as interrupt service routines or stack/heap memory. Both DTCM-RAMs can be used in parallel (for load/store operations) thanks to the Cortex<sup>®</sup>-M7 dual issue capability.

The MDMA can be used to load code or data in ITCM or DTCM RAMs.

### Error code correction (ECC)

Over the product lifetime, and/or due to external events such as radiations, invalid bits in memories may occur. They can be detected and corrected by ECC. This is an expected behavior that has to be managed at final-application software level in order to ensure data integrity through ECC algorithms implementation.

SRAM data are protected by ECC:

- 7 ECC bits are added per 32-bit word.
- 8 ECC bits are added per 64-bit word for AXI-SRAM and ITCM-RAM.

The ECC mechanism is based on the SECDED algorithm. It supports single-error correction and double-error detection.

### 3.3.3 ART™ accelerator

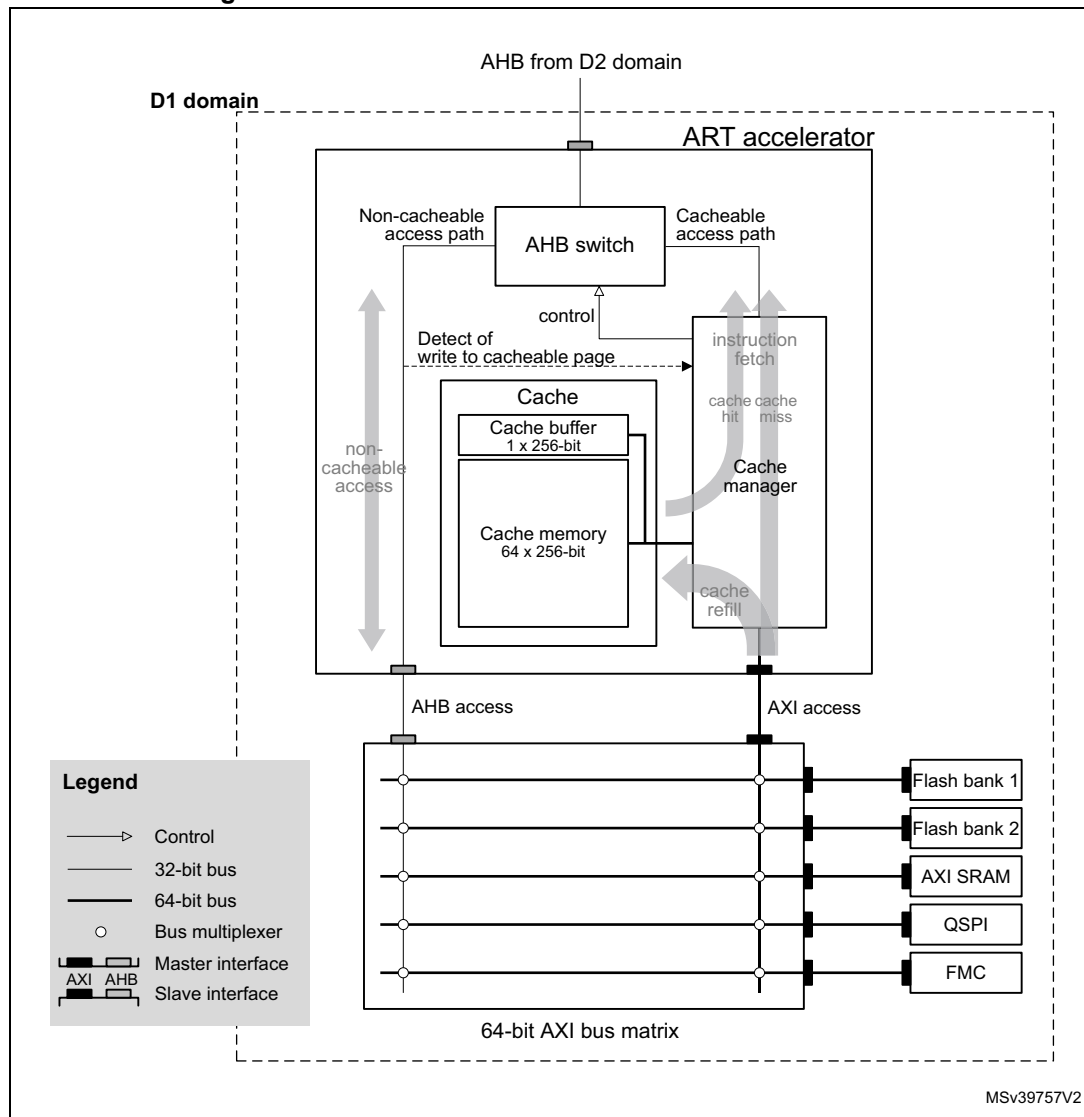

The ART™ (adaptive real-time) accelerator block speeds up instruction fetch accesses of the Cortex®-M4 core from D1-domain internal memories (Flash memory bank 1, Flash memory bank 2, AXI SRAM) and from D1-domain external memories attached via Quad-SPI controller and Flexible memory controller (FMC).

The ART™ accelerator is a 256-bit cache line using 64-bit WRAP4 accesses from the 64-bit AXI D1 domain. The acceleration is achieved by loading selected code into an embedded cache and making it instantly available to Cortex®-M4 core, thus avoiding latency due to memory wait states.

*Figure 3.* shows the block schematic and the environment of the ART accelerator.

Figure 3. ART™ accelerator schematic and environment

### 3.4 Boot modes

By default, the boot codes are executed simultaneously by both cores. However, by programming the appropriate Flash user option byte, it is possible to boot from one core while clock-gating the other core.

At startup, the boot memory space is selected by the BOOT pin and BOOT\_ADDx option bytes, allowing to program any boot memory address from 0x0000 0000 to 0x3FFF FFFF which includes:

- All Flash address space
- Flash memory and SRAMs (except for ITCM /DTCM RAMs which cannot be accessed by the Cortex®-M4 core)

The bootloader is located in non-user System memory. It is used to reprogram the Flash memory through a serial interface (USART, I2C, SPI, USB-DFU). Refer to *STM32 microcontroller System memory Boot mode* application note (AN2606) for details.

## 3.5 Power supply management

### 3.5.1 Power supply scheme

STM32H745xI/G power supply voltages are the following:

- $V_{DD} = 1.62$  to  $3.6$  V: external power supply for I/Os, provided externally through  $V_{DD}$  pins.
- $V_{DDLDO} = 1.62$  to  $3.6$  V: supply voltage for the internal regulator supplying  $V_{CORE}$
- $V_{DDA} = 1.62$  to  $3.6$  V: external analog power supplies for ADC, DAC, COMP and OPAMP.
- $V_{DD33USB}$  and  $V_{DD50USB}$ :  
 $V_{DD50USB}$  can be supplied through the USB cable to generate the  $V_{DD33USB}$  via the USB internal regulator. This allows supporting a  $V_{DD}$  supply different from  $3.3$  V.  
 The USB regulator can be bypassed to supply directly  $V_{DD33USB}$  if  $V_{DD} = 3.3$  V.
- $V_{BAT} = 1.2$  to  $3.6$  V: power supply for the  $V_{SW}$  domain when  $V_{DD}$  is not present.
- $V_{CAP}$ :  $V_{CORE}$  supply voltage, which values depend on voltage scaling ( $1.0$  V,  $1.1$  V,  $1.2$  V or  $1.35$  V). They are configured through VOS bits in PWR\_D3CR register and ODEN bit in the SYSCFG\_PWRCR register. The  $V_{CORE}$  domain is split into the following power domains that can be independently switch off.
  - D1 domain containing some peripherals and the Cortex<sup>®</sup>-M7 core.
  - D2 domain containing a large part of the peripherals and the Cortex<sup>®</sup>-M4 core.
  - D3 domain containing some peripherals and the system control.
- $V_{DDSMPS} = 1.62$  V to  $3.6$  V: SMPS step-down converter power supply  
 $V_{DDSMPS}$  must be kept at the same voltage level as  $V_{DD}$ .
- $V_{LXSMPS} =$  SMPS step-down converter output coupled to an inductor.
- $V_{FBSMPS} = V_{CORE}$ ,  $1.8$  V or  $2.5$  V external SMPS step-down converter feedback voltage sense input.

During power-up and power-down phases, the following power sequence requirements must be respected (see [Figure 4](#)):

- When  $V_{DD}$  is below  $1$  V, other power supplies ( $V_{DDA}$ ,  $V_{DD33USB}$ ,  $V_{DD50USB}$ ) must remain below  $V_{DD} + 300$  mV.
- When  $V_{DD}$  is above  $1$  V, all power supplies are independent (except for  $V_{DDSMPS}$ , which must remain at the same level as  $V_{DD}$ ).

During the power-down phase,  $V_{DD}$  can temporarily become lower than other supplies only if the energy provided to the microcontroller remains below  $1$  mJ. This allows external decoupling capacitors to be discharged with different time constants during the power-down transient phase.

Figure 4. Power-up/power-down sequence

1.  $V_{DDX}$  refers to any power supply among  $V_{DDA}$ ,  $V_{DD33USB}$ ,  $V_{DD50USB}$ .
2.  $V_{DD}$  and  $V_{DSDMPS}$  must be wired together in order to follow the same voltage sequence.

### 3.5.2 Power supply supervisor

The devices have an integrated power-on reset (POR)/ power-down reset (PDR) circuitry coupled with a Brownout reset (BOR) circuitry:

- Power-on reset (POR)
 

The POR supervisor monitors  $V_{DD}$  power supply and compares it to a fixed threshold. The devices remain in Reset mode when  $V_{DD}$  is below this threshold,
- Power-down reset (PDR)
 

The PDR supervisor monitors  $V_{DD}$  power supply. A reset is generated when  $V_{DD}$  drops below a fixed threshold.

The PDR supervisor can be enabled/disabled through PDR\_ON pin.
- Brownout reset (BOR)
 

The BOR supervisor monitors  $V_{DD}$  power supply. Three BOR thresholds (from 2.1 to 2.7 V) can be configured through option bytes. A reset is generated when  $V_{DD}$  drops below this threshold.

### 3.5.3 Voltage regulator (SMPS step-down converter and LDO)

The same voltage regulator supplies the 3 power domains (D1, D2 and D3). D1 and D2 can be independently switched off.

Voltage regulator output can be adjusted according to application needs through 6 power supply levels:

- Run mode (VOS0 to VOS3)
  - Scale 0: boosted performance (available only with LDO regulator)
  - Scale 1: high performance
  - Scale 2: medium performance and consumption
  - Scale 3: optimized performance and low-power consumption

*Note:* For STM32H745xxx3 sales types (industrial temperature range) the voltage regulator output can be set only to VOS2 or VOS3 in Run mode (VOS0 and VOS1 are not available for industrial temperature range).

- Stop mode (SVOS3 to SVOS5)
  - Scale 3: peripheral with wakeup from Stop mode capabilities (UART, SPI, I2C, LPTIM) are operational
  - Scale 4 and 5 where the peripheral with wakeup from Stop mode is disabled  
The peripheral functionality is disabled but wakeup from Stop mode is possible through GPIO or asynchronous interrupt.

### 3.5.4 SMPS step-down converter

The built-in SMPS step-down converter is a highly power-efficient DC/DC non-linear switching regulator that provides lower power consumption than a conventional voltage regulator (LDO).

The SMPS step-down converter can be used for the following purposes:

- Direct supply of the  $V_{CORE}$  domain
  - the SMPS step-down converter operating modes follow the device system operating modes (Run, Stop, Standby).
  - the SMPS step-down converter output voltage are set according to the selected VOS and SVOS bits (voltage scaling)
- Delivery of an intermediate voltage level to supply the internal voltage regulator (LDO)
  - SMPS step-down converter operating modes
    - When the SDEXTHP bit is equal to 0 in the PWR\_CR3 register, the SMPS step-down converter follows the device system operating modes (Run, Stop and Standby).
    - When the SDEXTHP bit is equal to 1 in PWR\_CR3, the SMPS step-down converter is forced to High-performance mode and does not follow the device system operating modes (Run, Stop and Standby).
  - The SMPS step-down converter output equals 1.8 V or 2.5 V according to the selected SD level
- Delivery of an external supply
  - The SMPS step-down converter is forced to High-performance mode (provided SDEXTHP bit is equal to 1 in PWR\_CR3)
  - The SMPS step-down converter output equals 1.8 V or 2.5 V according to the selected SD level

### 3.6 Low-power strategy

There are several ways to reduce power consumption on STM32H745xI/G:

- Select the SMPS step-down converter as  $V_{CORE}$  supply voltage source, as it allows to enhance power efficiency.
- Select the adequate voltage scaling
- Decrease the dynamic power consumption by slowing down the system clocks even in Run mode, and by individually clock gating the peripherals that are not used.
- Save power consumption when one or both CPUs are idle, by selecting among the available low-power mode according to the user application needs. This allows achieving the best compromise between short startup time, low-power consumption, as well as available wakeup sources.

The devices feature several low-power modes:

- CSleep (CPU clock stopped)
- CStop (CPU sub-system clock stopped)
- DStop (Domain bus matrix clock stopped)
- Stop (System clock stopped)
- DStandby (Domain powered down)
- Standby (System powered down)

CSleep and CStop low-power modes are entered by the MCU when executing the WFI (Wait for Interrupt) or WFE (Wait for Event) instructions, or when the SLEEPONEXIT bit of the Cortex<sup>®</sup>-Mx core is set after returning from an interrupt service routine.

A domain can enter low-power mode (DStop or DStandby) when the processor, its subsystem and the peripherals allocated in the domain enter low-power mode. For instance D1 or D2 domain enters DStop/DStandby mode when the CPU of the domain is in CStop mode AND the other CPU has no peripheral allocated in that domain, or if it is in CStop mode too. D3 domain can enter DStop/DStandby mode if both core subsystems do not have active peripherals in D3 domain, and D3 is not forced in Run mode.

If part of the domain is not in low-power mode, the domain remains in the current mode.

Finally the system can enter Stop or Standby when all EXTI wakeup sources are cleared and the power domains are in DStop or DStandby mode.

The clock system can be re-initialize by a master CPU (either the Cortex<sup>®</sup>-M4 or -M7) after exiting Stop mode while the slave CPU is held in low-power mode. Once the master CPU has re-initialized the system, the slave CPU can receive a wakeup interrupt and proceed with the interrupt service routine.

**Table 3. System vs domain low-power mode**

System power mode	D1 domain power mode	D2 domain power mode	D3 domain power mode
Run	DRun/DStop/DStandby	DRun/DStop/DStandby	DRun
Stop	DStop/DStandby	DStop/DStandby	DStop
Standby	DStandby	DStandby	DStandby

### 3.7 Reset and clock controller (RCC)

The clock and reset controller is located in D3 domain. The RCC manages the generation of all the clocks, as well as the clock gating and the control of the system and peripheral resets. It provides a high flexibility in the choice of clock sources and allows to apply clock ratios to improve the power consumption. In addition, on some communication peripherals that are capable to work with two different clock domains (either a bus interface clock or a kernel peripheral clock), the system frequency can be changed without modifying the baudrate.

#### 3.7.1 Clock management

The devices embed four internal oscillators, two oscillators with external crystal or resonator, two internal oscillators with fast startup time and three PLLs.

The RCC receives the following clock source inputs:

- Internal oscillators:
  - 64 MHz HSI clock
  - 48 MHz RC oscillator
  - 4 MHz CSI clock
  - 32 kHz LSI clock
- External oscillators:
  - HSE clock: 4-50 MHz (generated from an external source) or 4-48 MHz (generated from a crystal/ceramic resonator)
  - LSE clock: 32.768 kHz

The RCC provides three PLLs: one for system clock, two for kernel clocks.

The system starts on the HSI clock. The user application can then select the clock configuration.

### 3.7.2 System reset sources

Power-on reset initializes all registers while system reset reinitializes the system except for the debug, part of the RCC and power controller status registers, as well as the backup power domain.

A system reset is generated in the following cases:

- Power-on reset (pwr\_por\_rst)
- Brownout reset
- Low level on NRST pin (external reset)
- Independent watchdog 1 (from D1 domain)
- Independent watchdog 2 (from D2 domain)
- Window watchdog 1 (from D1 domain)
- Window watchdog 2 (from D2 domain)
- Software reset
- Low-power mode security reset
- Exit from Standby

## 3.8 General-purpose input/outputs (GPIOs)

Each of the GPIO pins can be configured by software as output (push-pull or open-drain, with or without pull-up or pull-down), as input (floating, with or without pull-up or pull-down) or as peripheral alternate function. Most of the GPIO pins are shared with digital or analog alternate functions. All GPIOs are high-current-capable and have speed selection to better manage internal noise, power consumption and electromagnetic emission.

After reset, all GPIOs (except debug pins) are in Analog mode to reduce power consumption (refer to GPIOs register reset values in the device reference manual).

The I/O configuration can be locked if needed by following a specific sequence in order to avoid spurious writing to the I/Os registers.

## 3.9 Bus-interconnect matrix

The devices feature an AXI bus matrix, two AHB bus matrices and bus bridges that allow interconnecting bus masters with bus slaves (see [Figure 5](#)).

Figure 5. STM32H745xl/G bus matrix

### 3.10 DMA controllers

The devices feature four DMA instances to unload CPU activity:

- A master direct memory access (MDMA)  
The MDMA is a high-speed DMA controller, which is in charge of all types of memory transfers (peripheral to memory, memory to memory, memory to peripheral), without any CPU action. It features a master AXI interface and a dedicated AHB interface to access Cortex<sup>®</sup>-M7 TCM memories.  
The MDMA is located in D1 domain. It is able to interface with the other DMA controllers located in D2 domain to extend the standard DMA capabilities, or can manage peripheral DMA requests directly.  
Each of the 16 channels can perform single block transfers, repeated block transfers and linked list transfers.
- Two dual-port DMAs (DMA1, DMA2) located in D2 domain, with FIFO and request router capabilities.
- One basic DMA (BDMA) located in D3 domain, with request router capabilities.

The DMA request router could be considered as an extension of the DMA controller. It routes the DMA peripheral requests to the DMA controller itself. This allowing managing the DMA requests with a high flexibility, maximizing the number of DMA requests that run concurrently, as well as generating DMA requests from peripheral output trigger or DMA event.

### 3.11 Chrom-ART Accelerator™ (DMA2D)

The Chrom-Art Accelerator™ (DMA2D) is a graphical accelerator which offers advanced bit blitting, row data copy and pixel format conversion. It supports the following functions:

- Rectangle filling with a fixed color
- Rectangle copy
- Rectangle copy with pixel format conversion
- Rectangle composition with blending and pixel format conversion

Various image format coding are supported, from indirect 4bpp color mode up to 32bpp direct color. It embeds dedicated memory to store color lookup tables. The DMA2D also supports block based YCbCr to handle JPEG decoder output.

An interrupt can be generated when an operation is complete or at a programmed watermark.

All the operations are fully automatized and are running independently from the CPU or the DMAs.

### 3.12 Nested vectored interrupt controller (NVIC)

Both Cortex<sup>®</sup>-M7 (CPU1) and Cortex<sup>®</sup>-M4 (CPU2) cores have their own nested vector interrupt controller (respectively NVIC1 and NVIC2). Each NVIC instance is able to manage 16 priority levels, and handle up to 150 maskable interrupt channels plus the 16 interrupt lines of the Cortex<sup>®</sup>-M7 with FPU core.

- Closely coupled NVIC gives low-latency interrupt processing
- Interrupt entry vector table address passed directly to the core
- Allows early processing of interrupts
- Processing of late arriving, higher-priority interrupts
- Support tail chaining
- Processor context automatically saved on interrupt entry, and restored on interrupt exit with no instruction overhead

This hardware block provides flexible interrupt management features with minimum interrupt latency.

### 3.13 Extended interrupt and event controller (EXTI)

The EXTI controller performs interrupt and event management. In addition, it can wake up the processors, power domains and/or D3 domain from Stop mode.

The EXTI handles up to 89 independent event/interrupt lines split as 28 configurable events and 61 direct events (including two interrupt lines for inter-core management).

Configurable events have dedicated pending flags, active edge selection, and software trigger capable.

Direct events provide interrupts or events from peripherals having a status flag.

### 3.14 Cyclic redundancy check calculation unit (CRC)

The CRC (cyclic redundancy check) calculation unit is used to get a CRC code using a programmable polynomial.

Among other applications, CRC-based techniques are used to verify data transmission or storage integrity. In the scope of the EN/IEC 60335-1 standard, they offer a means of verifying the Flash memory integrity. The CRC calculation unit helps compute a signature of the software during runtime, to be compared with a reference signature generated at link-time and stored at a given memory location.

### 3.15 Flexible memory controller (FMC)

The FMC controller main features are the following:

- Interface with static-memory mapped devices including:
  - Static random access memory (SRAM)
  - NOR Flash memory/OneNAND Flash memory
  - PSRAM (4 memory banks)
  - NAND Flash memory with ECC hardware to check up to 8 Kbytes of data
- Interface with synchronous DRAM (SDRAM/Mobile LPDDR SDRAM) memories
- 8-,16-,32-bit data bus width
- Independent Chip Select control for each memory bank
- Independent configuration for each memory bank
- Write FIFO
- Read FIFO for SDRAM controller
- The maximum FMC\_CLK/FMC\_SDCLK frequency for synchronous accesses is the FMC kernel clock divided by 2.

### 3.16 Quad-SPI memory interface (QUADSPI)

All devices embed a Quad-SPI memory interface, which is a specialized communication interface targeting Single, Dual or Quad-SPI Flash memories. It supports both single and double datarate operations.

It can operate in any of the following modes:

- Direct mode through registers
- External Flash status register polling mode
- Memory mapped mode.

Up to 256 Mbytes of external Flash memory can be mapped, and 8-, 16- and 32-bit data accesses are supported as well as code execution.

The opcode and the frame format are fully programmable.

### 3.17 Analog-to-digital converters (ADCs)

The STM32H745xI/G devices embed three analog-to-digital converters, which resolution can be configured to 16, 14, 12, 10 or 8 bits.

Each ADC shares up to 20 external channels, performing conversions in the Single-shot or Scan mode. In Scan mode, automatic conversion is performed on a selected group of analog inputs.

Additional logic functions embedded in the ADC interface allow:

- Simultaneous sample and hold
- Interleaved sample and hold

The ADC can be served by the DMA controller, thus allowing to automatically transfer ADC converted values to a destination location without any software action.

In addition, an analog watchdog feature can accurately monitor the converted voltage of one, some or all selected channels. An interrupt is generated when the converted voltage is outside the programmed thresholds.

To synchronize A/D conversion and timers, the ADCs could be triggered by any of TIM1, TIM2, TIM3, TIM4, TIM6, TIM8, TIM15, HRTIM1 and LPTIM1 timer.

### 3.18 Temperature sensor

STM32H745xI/G devices embed a temperature sensor that generates a voltage ( $V_{TS}$ ) that varies linearly with the temperature. This temperature sensor is internally connected to ADC3\_IN18. The conversion range is between 1.7 V and 3.6 V. It can measure the device junction temperature ranging from  $-40$  up to  $+140$  °C.

The temperature sensor have a good linearity, but it has to be calibrated to obtain a good overall accuracy of the temperature measurement. As the temperature sensor offset varies from chip to chip due to process variation, the uncalibrated internal temperature sensor is suitable for applications that detect temperature changes only. To improve the accuracy of the temperature sensor measurement, each device is individually factory-calibrated by ST. The temperature sensor factory calibration data are stored by ST in the System memory area, which is accessible in Read-only mode.

### 3.19 $V_{BAT}$ operation

The  $V_{BAT}$  power domain contains the RTC, the backup registers and the backup SRAM.

To optimize battery duration, this power domain is supplied by  $V_{DD}$  when available or by the voltage applied on VBAT pin (when  $V_{DD}$  supply is not present).  $V_{BAT}$  power is switched when the PDR detects that  $V_{DD}$  dropped below the PDR level.

The voltage on the VBAT pin could be provided by an external battery, a supercapacitor or directly by  $V_{DD}$ , in which case, the  $V_{BAT}$  mode is not functional.

$V_{BAT}$  operation is activated when  $V_{DD}$  is not present.

The  $V_{BAT}$  pin supplies the RTC, the backup registers and the backup SRAM.

*Note:* When the microcontroller is supplied from  $V_{BAT}$ , external interrupts and RTC alarm/events do not exit it from  $V_{BAT}$  operation.

When PDR\_ON pin is connected to  $V_{SS}$  (Internal Reset OFF), the  $V_{BAT}$  functionality is no more available and  $V_{BAT}$  pin should be connected to  $V_{DD}$ .

### 3.20 Digital-to-analog converters (DAC)

The two 12-bit buffered DAC channels can be used to convert two digital signals into two analog voltage signal outputs.

This dual digital Interface supports the following features:

- two DAC converters: one for each output channel
- 8-bit or 12-bit monotonic output
- left or right data alignment in 12-bit mode
- synchronized update capability
- noise-wave generation
- triangular-wave generation
- dual DAC channel independent or simultaneous conversions
- DMA capability for each channel including DMA underrun error detection
- external triggers for conversion
- input voltage reference  $V_{REF+}$  or internal VREFBUF reference.

The DAC channels are triggered through the timer update outputs that are also connected to different DMA streams.

### 3.21 Ultra-low-power comparators (COMP)

STM32H745xI/G devices embed two rail-to-rail comparators (COMP1 and COMP2). They feature programmable reference voltage (internal or external), hysteresis and speed (low speed for low-power) as well as selectable output polarity.

The reference voltage can be one of the following:

- An external I/O
- A DAC output channel
- An internal reference voltage or submultiple (1/4, 1/2, 3/4).

All comparators can wake up from Stop mode, generate interrupts and breaks for the timers, and be combined into a window comparator.

### 3.22 Operational amplifiers (OPAMP)

STM32H745xI/G devices embed two rail-to-rail operational amplifiers (OPAMP1 and OPAMP2) with external or internal follower routing and PGA capability.

The operational amplifier main features are:

- PGA with a non-inverting gain ranging of 2, 4, 8 or 16 or inverting gain ranging of -1, -3, -7 or -15
- One positive input connected to DAC
- Output connected to internal ADC
- Low input bias current down to 1 nA
- Low input offset voltage down to 1.5 mV
- Gain bandwidth up to 7.3 MHz

The device embeds two operational amplifiers (OPAMP1 and OPAMP2) with two inputs and one output each. These three I/Os can be connected to the external pins, thus enabling any type of external interconnections. The operational amplifiers can be configured internally as a follower, as an amplifier with a non-inverting gain ranging from 2 to 16 or with inverting gain ranging from -1 to -15.

### 3.23 Digital filter for sigma-delta modulators (DFSDM)

The device embeds one DFSDM with 4 digital filter modules and 8 external input serial channels (transceivers) or alternately 8 internal parallel inputs support.

The DFSDM peripheral is dedicated to interface the external  $\Sigma\Delta$  modulators to microcontroller and then to perform digital filtering of the received data streams (which represent analog value on  $\Sigma\Delta$  modulators inputs). DFSDM can also interface PDM (Pulse Density Modulation) microphones and perform PDM to PCM conversion and filtering in hardware. DFSDM features optional parallel data stream inputs from internal ADC peripherals or microcontroller memory (through DMA/CPU transfers into DFSDM).

DFSDM transceivers support several serial interface formats (to support various  $\Sigma\Delta$  modulators). DFSDM digital filter modules perform digital processing according to user selected filter parameters with up to 24-bit final ADC resolution.

The DFSDM peripheral supports:

- 8 multiplexed input digital serial channels:
  - configurable SPI interface to connect various SD modulator(s)
  - configurable Manchester coded 1 wire interface support
  - PDM (Pulse Density Modulation) microphone input support
  - maximum input clock frequency up to 20 MHz (10 MHz for Manchester coding)
  - clock output for SD modulator(s): 0..20 MHz
- alternative inputs from 8 internal digital parallel channels (up to 16 bit input resolution):
  - internal sources: ADC data or memory data streams (DMA)
- 4 digital filter modules with adjustable digital signal processing:
  - Sinc<sup>x</sup> filter: filter order/type (1..5), oversampling ratio (up to 1..1024)
  - integrator: oversampling ratio (1..256)
- up to 24-bit output data resolution, signed output data format
- automatic data offset correction (offset stored in register by user)
- continuous or single conversion
- start-of-conversion triggered by:
  - software trigger
  - internal timers
  - external events
  - start-of-conversion synchronously with first digital filter module (DFSDM0)
- analog watchdog feature:
  - low value and high value data threshold registers
  - dedicated configurable Sinc<sup>x</sup> digital filter (order = 1..3, oversampling ratio = 1..32)
  - input from final output data or from selected input digital serial channels
  - continuous monitoring independently from standard conversion

- short circuit detector to detect saturated analog input values (bottom and top range):
  - up to 8-bit counter to detect 1..256 consecutive 0's or 1's on serial data stream
  - monitoring continuously each input serial channel
- break signal generation on analog watchdog event or on short circuit detector event
- extremes detector:
  - storage of minimum and maximum values of final conversion data
  - refreshed by software
- DMA capability to read the final conversion data
- interrupts: end of conversion, overrun, analog watchdog, short circuit, input serial channel clock absence
- “regular” or “injected” conversions:
  - “regular” conversions can be requested at any time or even in Continuous mode without having any impact on the timing of “injected” conversions
  - “injected” conversions for precise timing and with high conversion priority

**Table 4. DFSDM implementation**

DFSDM features	DFSDM1
Number of filters	4
Number of input transceivers/channels	8
Internal ADC parallel input	X
Number of external triggers	16
Regular channel information in identification register	X

### 3.24 Digital camera interface (DCMI)

The devices embed a camera interface that can connect with camera modules and CMOS sensors through an 8-bit to 14-bit parallel interface, to receive video data. The camera interface can achieve a data transfer rate up to 105 Mbyte/s using a 60 MHz pixel clock. It features:

- Programmable polarity for the input pixel clock and synchronization signals
- Parallel data communication can be 8-, 10-, 12- or 14-bit
- Supports 8-bit progressive video monochrome or raw bayer format, YCbCr 4:2:2 progressive video, RGB 565 progressive video or compressed data (like JPEG)
- Supports Continuous mode or Snapshot (a single frame) mode
- Capability to automatically crop the image

### 3.25 LCD-TFT controller

The LCD-TFT display controller provides a 24-bit parallel digital RGB (Red, Green, Blue) and delivers all signals to interface directly to a broad range of LCD and TFT panels up to XGA (1024x768) resolution with the following features:

- 2 display layers with dedicated FIFO (64x64-bit)
- Color Look-Up table (CLUT) up to 256 colors (256x24-bit) per layer
- Up to 8 input color formats selectable per layer
- Flexible blending between two layers using alpha value (per pixel or constant)
- Flexible programmable parameters for each layer
- Color keying (transparency color)
- Up to 4 programmable interrupt events
- AXI master interface with burst of 16 words

### 3.26 JPEG Codec (JPEG)

The JPEG Codec can encode and decode a JPEG stream as defined in the *ISO/IEC 10918-1* specification. It provides an fast and simple hardware compressor and decompressor of JPEG images with full management of JPEG headers.

The JPEG codec main features are as follows:

- 8-bit/channel pixel depths
- Single clock per pixel encoding and decoding
- Support for JPEG header generation and parsing
- Up to four programmable quantization tables
- Fully programmable Huffman tables (two AC and two DC)
- Fully programmable minimum coded unit (MCU)
- Encode/decode support (non simultaneous)
- Single clock Huffman coding and decoding
- Two-channel interface: Pixel/Compress In, Pixel/Compressed Out
- Support for single greyscale component
- Ability to enable/disable header processing
- Fully synchronous design
- Configuration for High-speed decode mode

### 3.27 Random number generator (RNG)

All devices embed an RNG that delivers 32-bit random numbers generated by an integrated analog circuit.

### 3.28 Timers and watchdogs

The devices include one high-resolution timer, two advanced-control timers, ten general-purpose timers, two basic timers, five low-power timers, two watchdogs and a SysTick timer.

All timer counters can be frozen in Debug mode.

Table 5 compares the features of the advanced-control, general-purpose and basic timers.

**Table 5. Timer feature comparison**

Timer type	Timer	Counter resolution	Counter type	Prescaler factor	DMA request generation	Capture/compare channels	Complementary output	Max interface clock (MHz)	Max timer clock (MHz) <sup>(1)(2)</sup>
High-resolution timer	HRTIM1	16-bit	Up	/1 /2 /4 (x2 x4 x8 x16 x32, with DLL)	Yes	10	Yes	480 <sup>(2)</sup>	480
Advanced-control	TIM1, TIM8	16-bit	Up, Down, Up/down	Any integer between 1 and 65536	Yes	4	Yes	120	240
General purpose	TIM2, TIM5	32-bit	Up, Down, Up/down	Any integer between 1 and 65536	Yes	4	No	120	240
	TIM3, TIM4	16-bit	Up, Down, Up/down	Any integer between 1 and 65536	Yes	4	No	120	240
	TIM12	16-bit	Up	Any integer between 1 and 65536	No	2	No	120	240
	TIM13, TIM14	16-bit	Up	Any integer between 1 and 65536	No	1	No	120	240
	TIM15	16-bit	Up	Any integer between 1 and 65536	Yes	2	1	120	240
	TIM16, TIM17	16-bit	Up	Any integer between 1 and 65536	Yes	1	1	120	240

**Table 5. Timer feature comparison (continued)**

Timer type	Timer	Counter resolution	Counter type	Prescaler factor	DMA request generation	Capture/compare channels	Complementary output	Max interface clock (MHz)	Max timer clock (MHz) <sup>(1)(2)</sup>
Basic	TIM6, TIM7	16-bit	Up	Any integer between 1 and 65536	Yes	0	No	120	240
Low-power timer	LPTIM1, LPTIM2, LPTIM3, LPTIM4, LPTIM5	16-bit	Up	1, 2, 4, 8, 16, 32, 64, 128	No	0	No	120	240

1. The maximum timer clock is up to 480 MHz depending on TIMPRE bit in the RCC\_CFGR register and D2PRE1/2 bits in RCC\_D2CFGR register.
2. On STM32H745xxx3 sales types (extended industrial temperature range), the maximum clock frequency is 300 MHz for the high-resolution timer and 150 MHz for the other timers.

### 3.28.1 High-resolution timer (HRTIM1)

The high-resolution timer (HRTIM1) allows generating digital signals with high-accuracy timings, such as PWM or phase-shifted pulses.

It consists of 6 timers, 1 master and 5 slaves, totaling 10 high-resolution outputs, which can be coupled by pairs for deadtime insertion. It also features 5 fault inputs for protection purposes and 10 inputs to handle external events such as current limitation, zero voltage or zero current switching.

The HRTIM1 timer is made of a digital kernel clocked at 480 MHz<sup>(a)</sup> The high-resolution is available on the 10 outputs in all operating modes: variable duty cycle, variable frequency, and constant ON time.

The slave timers can be combined to control multiswitch complex converters or operate independently to manage multiple independent converters.

The waveforms are defined by a combination of user-defined timings and external events such as analog or digital feedbacks signals.

HRTIM1 timer includes options for blanking and filtering out spurious events or faults. It also offers specific modes and features to offload the CPU: DMA requests, Burst mode controller, Push-pull and Resonant mode.

It supports many topologies including LLC, Full bridge phase shifted, buck or boost converters, either in voltage or current mode, as well as lighting application (fluorescent or LED). It can also be used as a general purpose timer, for instance to achieve high-resolution PWM-emulated DAC.

a. Up to 300 MHz for STM32H745xxx3 sales types (extended industrial temperature range).

### 3.28.2 Advanced-control timers (TIM1, TIM8)

The advanced-control timers (TIM1, TIM8) can be seen as three-phase PWM generators multiplexed on 6 channels. They have complementary PWM outputs with programmable inserted dead times. They can also be considered as complete general-purpose timers. Their 4 independent channels can be used for:

- Input capture
- Output compare
- PWM generation (Edge- or Center-aligned modes)
- One-pulse mode output

If configured as standard 16-bit timers, they have the same features as the general-purpose TIMx timers. If configured as 16-bit PWM generators, they have full modulation capability (0-100%).

The advanced-control timer can work together with the TIMx timers via the Timer Link feature for synchronization or event chaining.

TIM1 and TIM8 support independent DMA request generation.

### 3.28.3 General-purpose timers (TIMx)

There are ten synchronizable general-purpose timers embedded in the STM32H745xI/G devices (see [Table 5](#) for differences).

- **TIM2, TIM3, TIM4, TIM5**

The devices include 4 full-featured general-purpose timers: TIM2, TIM3, TIM4 and TIM5. TIM2 and TIM5 are based on a 32-bit auto-reload up/downcounter and a 16-bit prescaler while TIM3 and TIM4 are based on a 16-bit auto-reload up/downcounter and a 16-bit prescaler. All timers feature 4 independent channels for input capture/output compare, PWM or One-pulse mode output. This gives up to 16 input capture/output compare/PWMs on the largest packages.

TIM2, TIM3, TIM4 and TIM5 general-purpose timers can work together, or with the other general-purpose timers and the advanced-control timers TIM1 and TIM8 via the Timer Link feature for synchronization or event chaining.

Any of these general-purpose timers can be used to generate PWM outputs.

TIM2, TIM3, TIM4, TIM5 all have independent DMA request generation. They are capable of handling quadrature (incremental) encoder signals and the digital outputs from 1 to 4 hall-effect sensors.

- **TIM12, TIM13, TIM14, TIM15, TIM16, TIM17**

These timers are based on a 16-bit auto-reload upcounter and a 16-bit prescaler. TIM13, TIM14, TIM16 and TIM17 feature one independent channel, whereas TIM12 and TIM15 have two independent channels for input capture/output compare, PWM or One-pulse mode output. They can be synchronized with the TIM2, TIM3, TIM4, TIM5 full-featured general-purpose timers or used as simple timebases.

### 3.28.4 Basic timers TIM6 and TIM7

These timers are mainly used for DAC trigger and waveform generation. They can also be used as a generic 16-bit time base.

TIM6 and TIM7 support independent DMA request generation.

### 3.28.5 Low-power timers (LPTIM1, LPTIM2, LPTIM3, LPTIM4, LPTIM5)

The low-power timers have an independent clock and is running also in Stop mode if it is clocked by LSE, LSI or an external clock. It is able to wakeup the devices from Stop mode.

This low-power timer supports the following features:

- 16-bit up counter with 16-bit autoreload register
- 16-bit compare register
- Configurable output: pulse, PWM
- Continuous / One-shot mode
- Selectable software / hardware input trigger
- Selectable clock source:
  - Internal clock source: LSE, LSI, HSI or APB clock
  - External clock source over LPTIM input (working even with no internal clock source running, used by the Pulse Counter Application)
- Programmable digital glitch filter
- Encoder mode

### 3.28.6 Independent watchdogs

There are two independent watchdogs, one per domain. Each independent watchdog is based on a 12-bit downcounter and 8-bit prescaler. It is clocked from an independent 32 kHz internal RC and as it operates independently from the main clock, it can operate in Stop and Standby modes. It can be used either as a watchdog to reset the device when a problem occurs, or as a free-running timer for application timeout management. It is hardware- or software-configurable through the option bytes.

### 3.28.7 Window watchdogs

There are two window watchdogs, one per domain. Each window watchdog is based on a 7-bit downcounter that can be set as free-running. It can be used as a watchdog to reset the device or each respective domain (configurable in the RCC register), when a problem occurs. It is clocked from the main clock. It has an early warning interrupt capability and the counter can be frozen in Debug mode.

### 3.28.8 SysTick timer

The devices feature two SysTick timers, one per CPU. These timers are dedicated to real-time operating systems, but could also be used as a standard downcounter. It features:

- A 24-bit downcounter
- Autoreload capability
- Maskable system interrupt generation when the counter reaches 0
- Programmable clock source.

### 3.29 Real-time clock (RTC), backup SRAM and backup registers

The RTC is an independent BCD timer/counter. It supports the following features:

- Calendar with subsecond, seconds, minutes, hours (12 or 24 format), week day, date, month, year, in BCD (binary-coded decimal) format.
- Automatic correction for 28, 29 (leap year), 30, and 31 days of the month.
- Two programmable alarms.
- On-the-fly correction from 1 to 32767 RTC clock pulses. This can be used to synchronize it with a master clock.
- Reference clock detection: a more precise second source clock (50 or 60 Hz) can be used to enhance the calendar precision.
- Digital calibration circuit with 0.95 ppm resolution, to compensate for quartz crystal inaccuracy.
- Three anti-tamper detection pins with programmable filter.
- Timestamp feature which can be used to save the calendar content. This function can be triggered by an event on the timestamp pin, or by a tamper event, or by a switch to  $V_{BAT}$  mode.
- 17-bit auto-reload wakeup timer (WUT) for periodic events with programmable resolution and period.

The RTC and the 32 backup registers are supplied through a switch that takes power either from the  $V_{DD}$  supply when present or from the  $V_{BAT}$  pin.

The backup registers are 32-bit registers used to store 128 bytes of user application data when  $V_{DD}$  power is not present. They are not reset by a system or power reset, or when the device wakes up from Standby mode.

The RTC clock sources can be:

- A 32.768 kHz external crystal (LSE)
- An external resonator or oscillator (LSE)
- The internal low-power RC oscillator (LSI, with typical frequency of 32 kHz)
- The high-speed external clock (HSE) divided by 32.

The RTC is functional in  $V_{BAT}$  mode and in all low-power modes when it is clocked by the LSE. When clocked by the LSI, the RTC is not functional in  $V_{BAT}$  mode, but is functional in all low-power modes.

All RTC events (Alarm, Wakeup Timer, Timestamp or Tamper) can generate an interrupt and wakeup the device from the low-power modes.

### 3.30 Inter-integrated circuit interface (I2C)

STM32H745xI/G devices embed four I<sup>2</sup>C interfaces.

The I<sup>2</sup>C bus interface handles communications between the microcontroller and the serial I<sup>2</sup>C bus. It controls all I<sup>2</sup>C bus-specific sequencing, protocol, arbitration and timing.

The I2C peripheral supports:

- I<sup>2</sup>C-bus specification and user manual rev. 5 compatibility:
  - Slave and Master modes, multimaster capability
  - Standard-mode (Sm), with a bitrate up to 100 kbit/s
  - Fast-mode (Fm), with a bitrate up to 400 kbit/s
  - Fast-mode Plus (Fm+), with a bitrate up to 1 Mbit/s and 20 mA output drive I/Os
  - 7-bit and 10-bit addressing mode, multiple 7-bit slave addresses
  - Programmable setup and hold times
  - Optional clock stretching
- System Management Bus (SMBus) specification rev 2.0 compatibility:
  - Hardware PEC (Packet Error Checking) generation and verification with ACK control
  - Address resolution protocol (ARP) support
  - SMBus alert
- Power System Management Protocol (PMBus™) specification rev 1.1 compatibility
- Independent clock: a choice of independent clock sources allowing the I2C communication speed to be independent from the PCLK reprogramming.
- Wakeup from Stop mode on address match
- Programmable analog and digital noise filters
- 1-byte buffer with DMA capability

### 3.31 Universal synchronous/asynchronous receiver transmitter (USART)

STM32H745xI/G devices have four embedded universal synchronous receiver transmitters (USART1, USART2, USART3 and USART6) and four universal asynchronous receiver transmitters (UART4, UART5, UART7 and UART8). Refer to [Table 6](#) for a summary of USARTx and UARTx features.

These interfaces provide asynchronous communication, IrDA SIR ENDEC support, multiprocessor communication mode, single-wire Half-duplex communication mode and have LIN Master/Slave capability. They provide hardware management of the CTS and RTS signals, and RS485 Driver Enable. They are able to communicate at speeds of up to 12.5 Mbit/s.

USART1, USART2, USART3 and USART6 also provide Smartcard mode (ISO 7816 compliant) and SPI-like communication capability.

The USARTs embed a Transmit FIFO (TXFIFO) and a Receive FIFO (RXFIFO). FIFO mode is enabled by software and is disabled by default.

All USART have a clock domain independent from the CPU clock, allowing the USARTx to wake up the MCU from Stop mode. The wakeup from Stop mode is programmable and can be done on:

- Start bit detection
- Any received data frame
- A specific programmed data frame
- Specific TXFIFO/RXFIFO status when FIFO mode is enabled.

All USART interfaces can be served by the DMA controller.

**Table 6. USART features**

USART modes/features <sup>(1)</sup>	USART1/2/3/6	UART4/5/7/8
Hardware flow control for modem	X	X
Continuous communication using DMA	X	X
Multiprocessor communication	X	X
Synchronous mode (Master/Slave)	X	-
Smartcard mode	X	-
Single-wire Half-duplex communication	X	X
IrDA SIR ENDEC block	X	X
LIN mode	X	X
Dual clock domain and wakeup from low power mode	X	X
Receiver timeout interrupt	X	X
Modbus communication	X	X
Auto baud rate detection	X	X
Driver Enable	X	X
USART data length	7, 8 and 9 bits	
Tx/Rx FIFO	X	X
Tx/Rx FIFO size	16	

1. X = supported.

### 3.32 Low-power universal asynchronous receiver transmitter (LPUART)

The device embeds one Low-Power UART (LPUART1). The LPUART supports asynchronous serial communication with minimum power consumption. It supports half duplex single wire communication and modem operations (CTS/RTS). It allows multiprocessor communication.

The LPUARTs embed a Transmit FIFO (TXFIFO) and a Receive FIFO (RXFIFO). FIFO mode is enabled by software and is disabled by default.

The LPUART has a clock domain independent from the CPU clock, and can wakeup the system from Stop mode. The wakeup from Stop mode are programmable and can be done on:

- Start bit detection
- Any received data frame
- A specific programmed data frame
- Specific TXFIFO/RXFIFO status when FIFO mode is enabled.

Only a 32.768 kHz clock (LSE) is needed to allow LPUART communication up to 9600 baud. Therefore, even in Stop mode, the LPUART can wait for an incoming frame while having an extremely low energy consumption. Higher speed clock can be used to reach higher baudrates.

LPUART interface can be served by the DMA controller.

### 3.33 Serial peripheral interface (SPI)/inter- integrated sound interfaces (I2S)

The devices feature up to six SPIs (SPI2S1, SPI2S2, SPI2S3, SPI4, SPI5 and SPI6) that allow communicating up to 150 Mbits/s in Master and Slave modes, in Half-duplex, Full-duplex and Simplex modes. The 3-bit prescaler gives 8 master mode frequencies and the frame is configurable from 4 to 16 bits. All SPI interfaces support NSS pulse mode, TI mode, Hardware CRC calculation and 8x 8-bit embedded Rx and Tx FIFOs with DMA capability.

Three standard I<sup>2</sup>S interfaces (multiplexed with SPI1, SPI2 and SPI3) are available. They can be operated in Master or Slave mode, in Simplex communication modes, and can be configured to operate with a 16-/32-bit resolution as an input or output channel. Audio sampling frequencies from 8 kHz up to 192 kHz are supported. When either or both of the I<sup>2</sup>S interfaces is/are configured in Master mode, the master clock can be output to the external DAC/CODEC at 256 times the sampling frequency. All I<sup>2</sup>S interfaces support 16x 8-bit embedded Rx and Tx FIFOs with DMA capability.

### 3.34 Serial audio interfaces (SAI)

The devices embed 4 SAIs (SAI1, SAI2, SAI3 and SAI4) that allow designing many stereo or mono audio protocols such as I2S, LSB or MSB-justified, PCM/DSP, TDM or AC'97. An SPDIF output is available when the audio block is configured as a transmitter. To bring this level of flexibility and reconfigurability, the SAI contains two independent audio sub-blocks. Each block has its own clock generator and I/O line controller.

Audio sampling frequencies up to 192 kHz are supported.

In addition, up to 8 microphones can be supported thanks to an embedded PDM interface. The SAI can work in master or slave configuration. The audio sub-blocks can be either receiver or transmitter and can work synchronously or asynchronously (with respect to the other one). The SAI can be connected with other SAIs to work synchronously.

### 3.35 SPDIFRX Receiver Interface (SPDIFRX)

The SPDIFRX peripheral is designed to receive an S/PDIF flow compliant with IEC-60958 and IEC-61937. These standards support simple stereo streams up to high sample rate, and compressed multi-channel surround sound, such as those defined by Dolby or DTS (up to 5.1).

The main SPDIFRX features are the following:

- Up to 4 inputs available
- Automatic symbol rate detection
- Maximum symbol rate: 12.288 MHz
- Stereo stream from 32 to 192 kHz supported
- Supports Audio IEC-60958 and IEC-61937, consumer applications
- Parity bit management
- Communication using DMA for audio samples
- Communication using DMA for control and user channel information
- Interrupt capabilities

The SPDIFRX receiver provides all the necessary features to detect the symbol rate, and decode the incoming data stream. The user can select the wanted SPDIF input, and when a valid signal will be available, the SPDIFRX will re-sample the incoming signal, decode the Manchester stream, recognize frames, sub-frames and blocks elements. It delivers to the CPU decoded data, and associated status flags.

The SPDIFRX also offers a signal named `spdif_frame_sync`, which toggles at the S/PDIF sub-frame rate that will be used to compute the exact sample rate for clock drift algorithms.

### 3.36 Single wire protocol master interface (SWPMI)

The Single wire protocol master interface (SWPMI) is the master interface corresponding to the Contactless Frontend (CLF) defined in the ETSI TS 102 613 technical specification. The main features are:

- Full-duplex communication mode
- automatic SWP bus state management (active, suspend, resume)
- configurable bitrate up to 2 Mbit/s
- automatic SOF, EOF and CRC handling

SWPMI can be served by the DMA controller.

### 3.37 Management Data Input/Output (MDIO) slaves

The devices embed an MDIO slave interface it includes the following features:

- 32 MDIO Registers addresses, each of which is managed using separate input and output data registers:
  - 32 x 16-bit firmware read/write, MDIO read-only output data registers
  - 32 x 16-bit firmware read-only, MDIO write-only input data registers
- Configurable slave (port) address
- Independently maskable interrupts/events:
  - MDIO Register write
  - MDIO Register read
  - MDIO protocol error
- Able to operate in and wake up from Stop mode

### 3.38 SD/SDIO/MMC card host interfaces (SDMMC)

Two SDMMC host interfaces are available. They support *MultiMediaCard System Specification Version 4.51* in three different databus modes: 1 bit (default), 4 bits and 8 bits.

Both interfaces support the *SD memory card specifications version 4.1*. and the *SDIO card specification version 4.0*. in two different databus modes: 1 bit (default) and 4 bits.

Each SDMMC host interface supports only one SD/SDIO/MMC card at any one time and a stack of MMC Version 4.51 or previous.

The SDMMC host interface embeds a dedicated DMA controller allowing high-speed transfers between the interface and the SRAM.

### 3.39 Controller area network (FDCAN1, FDCAN2)

The controller area network (CAN) subsystem consists of two CAN modules, a shared message RAM memory and a clock calibration unit.

Both CAN modules (FDCAN1 and FDCAN2) are compliant with ISO 11898-1 (CAN protocol specification version 2.0 part A, B) and CAN FD protocol specification version 1.0.

FDCAN1 supports time triggered CAN (TT-FDCAN) specified in ISO 11898-4, including event synchronized time-triggered communication, global system time, and clock drift compensation. The FDCAN1 contains additional registers, specific to the time triggered feature. The CAN FD option can be used together with event-triggered and time-triggered CAN communication.

A 10-Kbyte message RAM memory implements filters, receive FIFOs, receive buffers, transmit event FIFOs, transmit buffers (and triggers for TT-FDCAN). This message RAM is shared between the two FDCAN1 and FDCAN2 modules.

The common clock calibration unit is optional. It can be used to generate a calibrated clock for both FDCAN1 and FDCAN2 from the HSI internal RC oscillator and the PLL, by evaluating CAN messages received by the FDCAN1.

### 3.40 Universal serial bus on-the-go high-speed (OTG\_HS)

The devices embed two USB OTG high-speed (up to 480 Mbit/s) device/host/OTG peripheral. OTG-HS1 supports both full-speed and high-speed operations, while OTG-HS2 supports only full-speed operations. They both integrate the transceivers for full-speed operation (12 Mbit/s) and are able to operate from the internal HSI48 oscillator. OTG-HS1 features a UTMI low-pin interface (ULPI) for high-speed operation (480 Mbit/s). When using the USB OTG-HS1 in HS mode, an external PHY device connected to the ULPI is required.

The USB OTG HS peripherals are compliant with the USB 2.0 specification and with the OTG 2.0 specification. They have software-configurable endpoint setting and supports suspend/resume. The USB OTG controllers require a dedicated 48 MHz clock that is generated by a PLL connected to the HSE oscillator.

The main features are:

- Combined Rx and Tx FIFO size of 4 Kbytes with dynamic FIFO sizing
- Supports the session request protocol (SRP) and host negotiation protocol (HNP)
- 9 bidirectional endpoints (including EP0)
- 16 host channels with periodic OUT support
- Software configurable to OTG1.3 and OTG2.0 modes of operation
- USB 2.0 LPM (Link Power Management) support
- Battery Charging Specification Revision 1.2 support
- Internal FS OTG PHY support
- External HS or HS OTG operation supporting ULPI in SDR mode (OTG\_HS1 only)

The OTG PHY is connected to the microcontroller ULPI port through 12 signals. It can be clocked using the 60 MHz output.

- Internal USB DMA
- HNP/SNP/IP inside (no need for any external resistor)
- For OTG/Host modes, a power switch is needed in case bus-powered devices are connected

### 3.41 Ethernet MAC interface with dedicated DMA controller (ETH)

The devices provide an IEEE-802.3-2002-compliant media access controller (MAC) for ethernet LAN communications through an industry-standard medium-independent interface (MII) or a reduced medium-independent interface (RMII). The microcontroller requires an external physical interface device (PHY) to connect to the physical LAN bus (twisted-pair, fiber, etc.). The PHY is connected to the device MII port using 17 signals for MII or 9 signals for RMII, and can be clocked using the 25 MHz (MII) from the microcontroller.

The devices include the following features:

- Supports 10 and 100 Mbit/s rates
- Dedicated DMA controller allowing high-speed transfers between the dedicated SRAM and the descriptors
- Tagged MAC frame support (VLAN support)
- Half-duplex (CSMA/CD) and full-duplex operation
- MAC control sublayer (control frames) support
- 32-bit CRC generation and removal
- Several address filtering modes for physical and multicast address (multicast and group addresses)
- 32-bit status code for each transmitted or received frame
- Internal FIFOs to buffer transmit and receive frames. The transmit FIFO and the receive FIFO are both 2 Kbytes.
- Supports hardware PTP (precision time protocol) in accordance with IEEE 1588 2008 (PTP V2) with the time stamp comparator connected to the TIM2 input
- Triggers interrupt when system time becomes greater than target time

### 3.42 High-definition multimedia interface (HDMI) - consumer electronics control (CEC)

The devices embed a HDMI-CEC controller that provides hardware support for the Consumer Electronics Control (CEC) protocol (Supplement 1 to the HDMI standard).

This protocol provides high-level control functions between all audiovisual products in an environment. It is specified to operate at low speeds with minimum processing and memory overhead. It has a clock domain independent from the CPU clock, allowing the HDMI-CEC controller to wakeup the MCU from Stop mode on data reception.

### 3.43 Debug infrastructure

The devices offer a comprehensive set of debug and trace features on both cores to support software development and system integration.

- Breakpoint debugging
- Code execution tracing
- Software instrumentation
- JTAG debug port
- Serial-wire debug port
- Trigger input and output
- Serial-wire trace port
- Trace port
- Arm® CoreSight™ debug and trace components

The debug can be controlled via a JTAG/Serial-wire debug access port, using industry standard debugging tools. The debug infrastructure allows debugging one core at a time, or both cores in parallel.

The trace port performs data capture for logging and analysis.

A 4-Kbyte embedded trace FIFO (ETF) allows recording data and sending them to any com port. In Trace mode, the trace is transferred by DMA to system RAM or to a high-speed interface (such as SPI or USB). It can even be monitored by a software running on one of the cores. Unlike hardware FIFO mode, this mode is invasive since it uses system resources which are shared by the processors.

## 4 Memory mapping

Refer to the product line reference manual for details on the memory mapping as well as the boundary addresses for all peripherals.

1. When this pin/ball was previously configured as an oscillator, the oscillator function is kept during and after a reset. This is valid for all resets except for power-on reset.
2. Pxy\_C and Pxy pins/balls are two separate pads (analog switch open). The analog switch is configured through a SYSCFG register. Refer to the product reference manual for a detailed description of the switch configuration bits.
3. There is a direct path between Pxy\_C and Pxy pins/balls, through an analog switch. Pxy alternate functions are available on Pxy\_C when the analog switch is closed. The analog switch is configured through a SYSCFG register. Refer to the product reference manual for a detailed description of the switch configuration bits.

## 6 Electrical characteristics

### 6.1 Parameter conditions

Unless otherwise specified, all voltages are referenced to  $V_{SS}$ .

#### 6.1.1 Minimum and maximum values

Unless otherwise specified the minimum and maximum values are guaranteed in the worst conditions of junction temperature, supply voltage and frequencies by tests in production on 100% of the devices with an junction temperature at  $T_J = 25\text{ }^\circ\text{C}$  and  $T_J = T_{Jmax}$  (given by the selected temperature range).

Data based on characterization results, design simulation and/or technology characteristics are indicated in the table footnotes. Based on characterization, the minimum and maximum values refer to sample tests and represent the mean value plus or minus three times the standard deviation ( $\text{mean} \pm 3\sigma$ ).

#### 6.1.2 Typical values

Unless otherwise specified, typical data are based on  $T_J = 25\text{ }^\circ\text{C}$ ,  $V_{DD} = 3.3\text{ V}$  (for the  $1.7\text{ V} \leq V_{DD} \leq 3.6\text{ V}$  voltage range). They are given only as design guidelines and are not tested.

Typical ADC accuracy values are determined by characterization of a batch of samples from a standard diffusion lot over the full temperature range, where 95% of the devices have an error less than or equal to the value indicated ( $\text{mean} \pm 2\sigma$ ).

#### 6.1.3 Typical curves

Unless otherwise specified, all typical curves are given only as design guidelines and are not tested.

#### 6.1.4 Loading capacitor

The loading conditions used for pin parameter measurement are shown in [Figure 11](#).

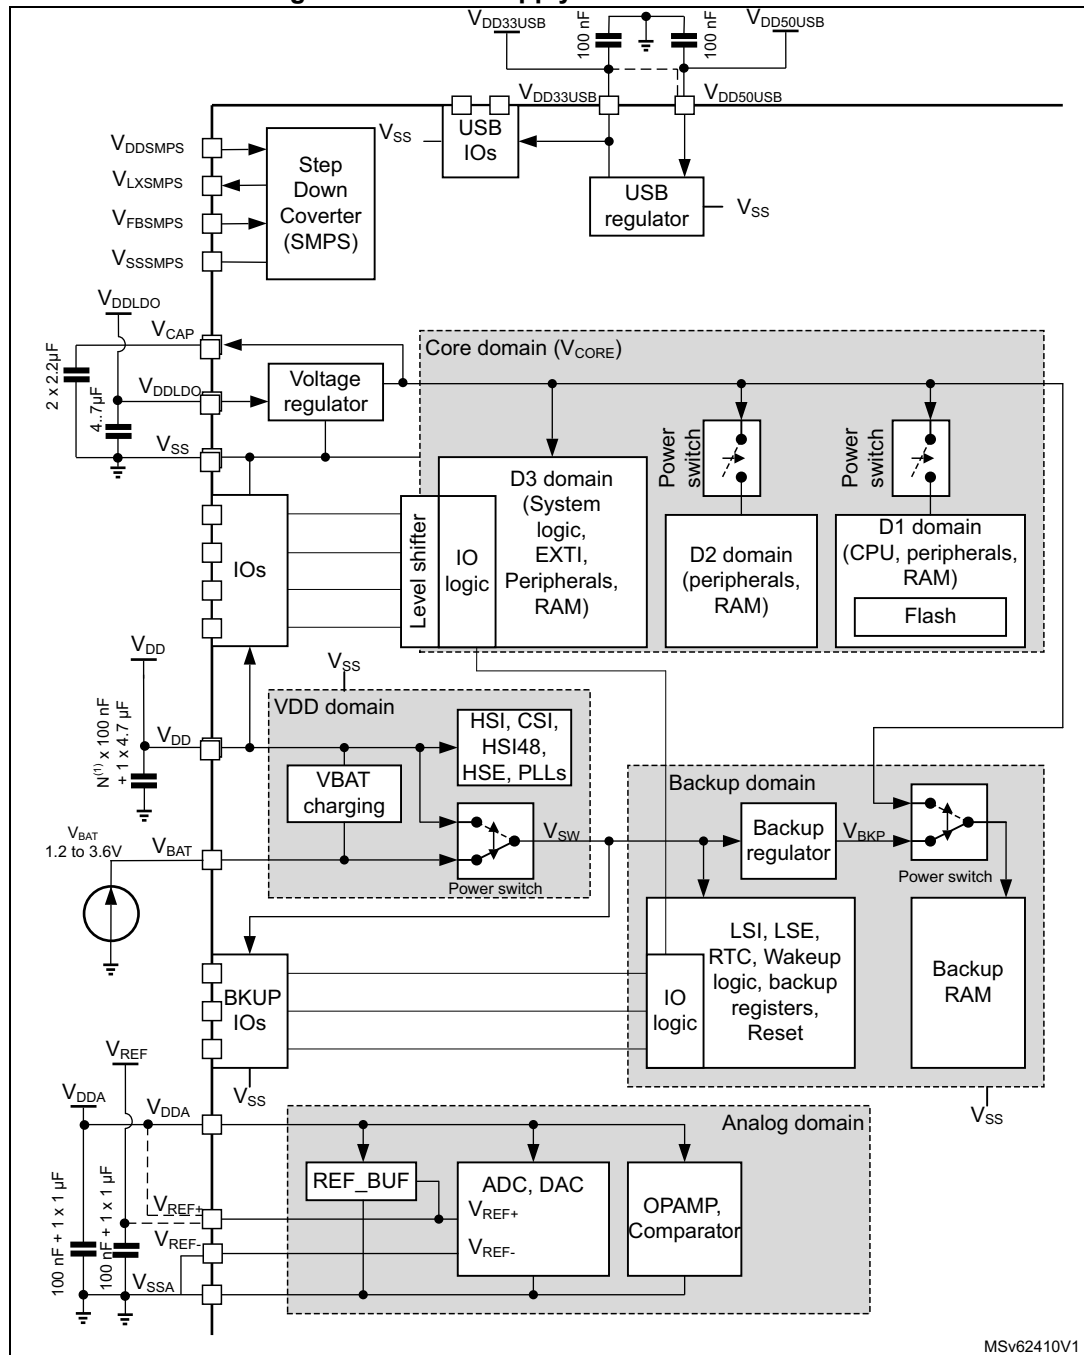

#### 6.1.5 Pin input voltage

The input voltage measurement on a pin of the device is described in [Figure 12](#).

6.1.6 Power supply scheme

Figure 13. Power supply scheme

MSv62410V1

1. N corresponds to the number of VDD pins available on the package.
2. A tolerance of +/- 20% is acceptable on decoupling capacitors.

**Caution:** Each power supply pair ( $V_{DD}/V_{SS}$ ,  $V_{DDA}/V_{SSA}$  ...) must be decoupled with filtering ceramic capacitors as shown above. These capacitors must be placed as close as possible to, or below, the appropriate pins on the underside of the PCB to ensure good operation of the

device. It is not recommended to remove filtering capacitors to reduce PCB size or cost. This might cause incorrect operation of the device.

### 6.1.7 Current consumption measurement

Figure 14. Current consumption measurement scheme

## 6.2 Absolute maximum ratings

Stresses above the absolute maximum ratings listed in [Table 20: Voltage characteristics](#), [Table 21: Current characteristics](#), and [Table 22: Thermal characteristics](#) may cause permanent damage to the device. These are stress ratings only and the functional operation of the device at these conditions is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

Table 20. Voltage characteristics <sup>(1)</sup>

Symbols	Ratings	Min	Max	Unit
$V_{DDX} - V_{SS}$	External main supply voltage (including $V_{DD}$ , $V_{DDLDO}$ , $V_{DDSMPS}$ , $V_{DDA}$ , $V_{DD33USB}$ , $V_{BAT}$ )	-0.3	4.0	V
$V_{IN}^{(2)}$	Input voltage on FT_XXX pins	$V_{SS}-0.3$	$\text{Min}(V_{DD}, V_{DDA}, V_{DD33USB}, V_{BAT}) + 4.0^{(3)(4)}$	V
	Input voltage on TT_XX pins	$V_{SS}-0.3$	4.0	V
	Input voltage on BOOT0 pin	$V_{SS}$	9.0	V
	Input voltage on any other pins	$V_{SS}-0.3$	4.0	V
$ \Delta V_{DDX} $	Variations between different $V_{DDX}$ power pins of the same domain	-	50	mV
$ V_{SSx}-V_{SS} $	Variations between all the different ground pins	-	50	mV

1. All main power ( $V_{DD}$ ,  $V_{DDA}$ ,  $V_{DD33USB}$ ,  $V_{DDSMPS}$ ,  $V_{BAT}$ ) and ground ( $V_{SS}$ ,  $V_{SSA}$ ) pins must always be connected to the external power supply, in the permitted range.
2.  $V_{IN}$  maximum must always be respected. Refer to [Table 68: I/O current injection susceptibility](#) for the maximum allowed injected current values.
3. This formula has to be applied on power supplies related to the IO structure described by the pin definition table.
4. To sustain a voltage higher than 4V the internal pull-up/pull-down resistors must be disabled.

**Table 21. Current characteristics**

Symbols	Ratings	Max	Unit
$\Sigma I_{V_{DD}}$	Total current into sum of all $V_{DD}$ power lines (source) <sup>(1)</sup>	620	mA
$\Sigma I_{V_{SS}}$	Total current out of sum of all $V_{SS}$ ground lines (sink) <sup>(1)</sup>	620	
$I_{V_{DD}}$	Maximum current into each $V_{DD}$ power pin (source) <sup>(1)</sup>	100	
$I_{V_{SS}}$	Maximum current out of each $V_{SS}$ ground pin (sink) <sup>(1)</sup>	100	
$I_{IO}$	Output current sunk by any I/O and control pin	20	
$\Sigma I_{(PIN)}$	Total output current sunk by sum of all I/Os and control pins <sup>(2)</sup>	140	
	Total output current sourced by sum of all I/Os and control pins <sup>(2)</sup>	140	
$I_{INJ(PIN)}$ <sup>(3)(4)</sup>	Injected current on FT_xxx, TT_xx, RST and B pins except PA4, PA5	-5/+0	
	Injected current on PA4, PA5	-0/0	
$\Sigma I_{INJ(PIN)}$	Total injected current (sum of all I/Os and control pins) <sup>(5)</sup>	±25	

1. All main power ( $V_{DD}$ ,  $V_{DDA}$ ,  $V_{DD33USB}$ ) and ground ( $V_{SS}$ ,  $V_{SSA}$ ) pins must always be connected to the external power supplies, in the permitted range.
2. This current consumption must be correctly distributed over all I/Os and control pins. The total output current must not be sunk/sourced between two consecutive power supply pins referring to high pin count QFP packages.
3. Positive injection is not possible on these I/Os and does not occur for input voltages lower than the specified maximum value.
4. A positive injection is induced by  $V_{IN} > V_{DD}$  while a negative injection is induced by  $V_{IN} < V_{SS}$ .  $I_{INJ(PIN)}$  must never be exceeded. Refer also to [Table 20: Voltage characteristics](#) for the maximum allowed input voltage values.
5. When several inputs are submitted to a current injection, the maximum  $\Sigma I_{INJ(PIN)}$  is the absolute sum of the positive and negative injected currents (instantaneous values).

**Table 22. Thermal characteristics**

Symbol	Ratings	Value	Unit
$T_{STG}$	Storage temperature range	- 65 to +150	°C
$T_J$	Maximum junction temperature	125 <sup>(1)</sup>	
		140 <sup>(2)</sup>	

1. For industrial temperature range 6.
2. For extended industrial temperature range 3.

### 6.3 Operating conditions

#### 6.3.1 General operating conditions

Table 23. General operating conditions

Symbol	Parameter	Operating conditions	Min	Typ	Max	Unit
V <sub>DD</sub>	Standard operating voltage	-	1.62 <sup>(1)</sup>	-	3.6	V
V <sub>DDLDO</sub>	Supply voltage for the internal regulator	V <sub>DDLDO</sub> ≤ V <sub>DD</sub>	1.62 <sup>(1)</sup> 1.2 <sup>(2)</sup>	-	3.6	V
V <sub>DDSMPS</sub>	Supply voltage for the internal SMPS Step-down converter	V <sub>DDSMPS</sub> = V <sub>DD</sub>	1.62 <sup>(1)</sup>	-	3.6	V
V <sub>DD33USB</sub>	Standard operating voltage, USB domain	USB used USB not used	3.0 0	-	3.6	V
V <sub>DDA</sub>	Analog operating voltage	ADC or COMP used DAC used OPAMP used VREFBUF used ADC, DAC, OPAMP, COMP, VREFBUF not used	1.62 1.8 2.0 1.8 0	-	3.6	
V <sub>IN</sub>	I/O Input voltage	TT_xx I/O BOOT0 All I/O except BOOT0 and TT_xx	-0.3 0 -0.3	-	V <sub>DD</sub> +0.3 9 Min(V <sub>DD</sub> , V <sub>DDA</sub> , V <sub>DD33USB</sub> ) +3.6V < 5.5V <sup>(3)(4)</sup>	

Table 23. General operating conditions (continued)

Symbol	Parameter	Operating conditions	Min	Typ	Max	Unit
V <sub>CORE</sub>	Internal regulator ON (LDO)	VOS3 (max frequency 200 MHz)	0.95	1.0	1.26	V
		VOS2 (max frequency 300 MHz)	1.05	1.10	1.26	
		VOS1 (max frequency 400 MHz)	1.15	1.20	1.26	
		VOS0 <sup>(5)</sup> (max frequency 480 MHz <sup>(6)</sup> )	1.26	1.35	1.40	
	Internal regulator ON (SMPS step-down converter) <sup>(7)</sup>	VOS3 (max frequency 200 MHz)	0.95	1.0	1.26	
		VOS2 (max frequency 300 MHz)	1.05	1.10	1.26	
		VOS1 (max frequency 400 MHz)	1.15	1.20	1.26	
	Regulator OFF: external V <sub>CORE</sub> voltage must be supplied from external regulator on two VCAP pins	VOS3 (max frequency 200 MHz)	0.98	1.03	1.26	
		VOS2 (max frequency 300 MHz)	1.08	1.13	1.26	
		VOS1 (max frequency 400 MHz)	1.17	1.23	1.26	
		VOS0 (max frequency 480 MHz <sup>(6)</sup> )	1.37	1.38	1.40	

Table 23. General operating conditions (continued)

Symbol	Parameter	Operating conditions	Min	Typ	Max	Unit
f <sub>CPU1</sub>	Arm® Cortex®-M7 clock frequency	VOS3	-	-	200	MHz
		VOS2	-	-	300	
		VOS1	-	-	400	
		VOS0	-	-	480 <sup>(6)</sup>	
f <sub>CPU2</sub>	Arm® Cortex®-M4 clock frequency	VOS3	-	-	200	
		VOS2	-	-	150	
		VOS1	-	-	200	
		VOS0	-	-	240 <sup>(6)</sup>	
f <sub>ACLK</sub>	AXI clock frequency	VOS3	-	-	100	
		VOS2	-	-	150	
		VOS1	-	-	200	
		VOS0	-	-	240 <sup>(6)</sup>	
f <sub>HCLK</sub>	AHB clock frequency	VOS3	-	-	100	
		VOS2	-	-	150	
		VOS1	-	-	200	
		VOS0	-	-	240 <sup>(6)</sup>	
f <sub>PCLK</sub>	APB clock frequency	VOS3	-	-	50 <sup>(8)</sup>	
		VOS2	-	-	75	
		VOS1	-	-	100	
		VOS0	-	-	120 <sup>(6)</sup>	

1. When RESET is released functionality is guaranteed down to V<sub>BOR0</sub> min
2. Only for power-up sequence when the SMPS step-down converter is configured to supply the LDO and T<sub>Jmax</sub> = 105 °C.
3. This formula has to be applied on power supplies related to the IO structure described by the pin definition table.
4. For operation with voltage higher than Min (V<sub>DD</sub>, V<sub>DDA</sub>, V<sub>DD33USB</sub>) +0.3V, the internal Pull-up and Pull-Down resistors must be disabled.
5. VOS0 is available only when the LDO regulator is ON.
6. T<sub>Jmax</sub> = 105 °C.
7. At startup, the external V<sub>CORE</sub> voltage must remain higher or equal to 1.10 V before disabling the internal regulator (LDO).
8. Maximum APB clock frequency when at least one peripheral is enabled.

Table 24. Supply voltage and maximum frequency configuration

Power scale	V <sub>CORE</sub> source	Max T <sub>J</sub> (°C)	Max frequency (MHz)	Min V <sub>DD</sub> (V)
VOS0	LDO	105	480	1.7
	SMPS step-down converter <sup>(1)</sup>	-	-	-

**Table 24. Supply voltage and maximum frequency configuration (continued)**

Power scale	V <sub>CORE</sub> source	Max T <sub>J</sub> (°C)	Max frequency (MHz)	Min V <sub>DD</sub> (V)
VOS1	LDO	125	400	1.62
	SMPS step-down converter			
VOS2	LDO	125	300	1.62
	SMPS step-down converter	125		
		140		
VOS3	LDO <sup>(2)</sup>	105	64	1.2 <sup>(2)</sup>
	LDO	125	200	1.62
	SMPS step-down converter	125		
		140 <sup>(3)</sup>		
SVOS4	LDO	105	N/A	1.62
	SMPS step-down converter	125		
		140 <sup>(3)</sup>		
SVOS5	LDO	105	N/A	1.62
	SMPS step-down converter	125		
		140 <sup>(3)</sup>		

- VOS0 (power scale 0) is not available when the SMPS step-down converter directly supplies V<sub>CORE</sub>.
- Only for power-up sequence when the SMPS step-down converter supplies the LDO.
- Extended Industrial temperature range sales types (range 3).

### 6.3.2 VCAP external capacitor

Stabilization for the main regulator is achieved by connecting an external capacitor C<sub>EXT</sub> to the VCAP pin. C<sub>EXT</sub> is specified in [Table 25](#). Two external capacitors can be connected to VCAP pins.

**Figure 15. External capacitor C<sub>EXT</sub>**

- Legend: ESR is the equivalent series resistance.

**Table 25. VCAP operating conditions<sup>(1)</sup>**

Symbol	Parameter	Conditions
C <sub>EXT</sub>	Capacitance of external capacitor	2.2 μF <sup>(2)</sup>
ESR	ESR of external capacitor	< 100 mΩ

1. When bypassing the voltage regulator, the two 2.2  $\mu\text{F}$   $V_{\text{CAP}}$  capacitors are not required and should be replaced by two 100 nF decoupling capacitors.
2. This value corresponds to  $C_{\text{EXT}}$  typical value. A variation of +/-20% is tolerated.

### 6.3.3 SMPS step-down converter

The devices embed a high power efficiency SMPS step-down converter. SMPS characteristics for external usage are given in [Table 27](#). The SMPS step-down converter requires external components that are specified in [Figure 16](#) and [Table 26](#).

**Figure 16. External components for SMPS step-down converter**

**Table 26. Characteristics of SMPS step-down converter external components**

Symbol	Parameter	Conditions
$C_{\text{in}}$	Capacitance of external capacitor on $V_{\text{DDSMPS}}$	4.7 $\mu\text{F}$
	ESR of external capacitor	100 m $\Omega$
$C_{\text{filt}}$	Capacitance of external capacitor on $V_{\text{LXSMPS}}$ pin	220 pF
$C_{\text{OUT}}$	Capacitance of external capacitor on $V_{\text{FBSMPS}}$ pin	10 $\mu\text{F}$
	ESR of external capacitor	20 m $\Omega$
L	Inductance of external Inductor on $V_{\text{LXSMPS}}$ pin	2.2 $\mu\text{H}$
-	Serial DC resistor	150 m $\Omega$
$I_{\text{SAT}}$	DC current at which the inductance drops 30% from its value without current.	1.7 A
$I_{\text{RMS}}$	Average current for a 40 °C rise: rated current for which the temperature of the inductor is raised 40°C by DC current	1.4 A

**Table 27. SMPS step-down converter characteristics for external usage**

Parameters	Conditions	Min	Typ	Max	Unit
V <sub>DDSMPS</sub> <sup>(1)</sup>	V <sub>OUT</sub> = 1.8 V	2.3	-	3.6	V
	V <sub>OUT</sub> = 2.5 V	3	-	3.6	
V <sub>OUT</sub> <sup>(2)</sup>	I <sub>out</sub> =600 mA	2.25	2.5	2.75	V
		1.62	1.8	1.98	
I <sub>OUT</sub>	internal and external usage	-	-	600	mA
	External usage only <sup>(3)</sup>	-	-	600	
RDS <sub>ON</sub>	-	-	100	120	mΩ
I <sub>DDSMPS_Q</sub>	Quiescent current	-	220	-	μA
T <sub>SMPS_START</sub>	V <sub>OUT</sub> = 1.8 V	-	-	225	μs
	V <sub>OUT</sub> = 2.5 V	-	-	300	

1. The switching frequency is 2.4 MHz±10%
2. Including line transient and load transient.
3. These characteristics are given for SDEXTHP bit is set in the PWR\_CR3 register.

### 6.3.4 Operating conditions at power-up / power-down

Subject to general operating conditions for T<sub>A</sub>.

**Table 28. Operating conditions at power-up / power-down (regulator ON)**

Symbol	Parameter	Min	Max	Unit
t <sub>VDD</sub>	V <sub>DD</sub> rise time rate	0	∞	μs/V
	V <sub>DD</sub> fall time rate	10	∞	
t <sub>VDDA</sub>	V <sub>DDA</sub> rise time rate	0	∞	
	V <sub>DDA</sub> fall time rate	10	∞	
t <sub>VDDUSB</sub>	V <sub>DDUSB</sub> rise time rate	0	∞	
	V <sub>DDUSB</sub> fall time rate	10	∞	

### 6.3.5 Embedded reset and power control block characteristics

The parameters given in [Table 29](#) are derived from tests performed under ambient temperature and  $V_{DD}$  supply voltage conditions summarized in [Table 23: General operating conditions](#).

**Table 29. Reset and power control block characteristics**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$t_{RSTTEMPO}^{(1)}$	Reset temporization after BOR0 released	-	-	377	-	$\mu s$
$V_{BOR0}$	Brown-out reset threshold 0	Rising edge <sup>(1)</sup>	1.62	1.67	1.71	V
		Falling edge	1.58	1.62	1.68	
$V_{BOR1}$	Brown-out reset threshold 1	Rising edge	2.04	2.10	2.15	
		Falling edge	1.95	2.00	2.06	
$V_{BOR2}$	Brown-out reset threshold 2	Rising edge	2.34	2.41	2.47	
		Falling edge	2.25	2.31	2.37

V <sub>hyst_VDDA</sub>	Hysteresis of V <sub>DDA</sub> voltage detector	-	-	100	-		mV
I <sub>DD_PVM</sub>	PVM consumption from V <sub>DD</sub> (1)	-	-	-	0.25		μA
I <sub>DD_VDDA</sub>	Voltage detector consumption on V <sub>DDA</sub> (1)	Resistor bridge	-	-	2.5	μA	

1. Guaranteed by design.
2. BOR0 is enabled in all modes and its consumption is therefore included in the supply current characteristics tables (refer to [Section 6.3.7: Supply current characteristics](#)).

### 6.3.6 Embedded reference voltage

The parameters given in [Table 30](#) are derived from tests performed under ambient temperature and V<sub>DD</sub> supply voltage conditions summarized in [Table 23: General operating conditions](#).

Table 30. Embedded reference voltage

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
V <sub>REFINT</sub>	Internal reference voltages	-40°C < T <sub>J</sub> < 140 °C, V <sub>DD</sub> = 3.3 V	1.180	1.216	1.255	V
t <sub>S_vrefint</sub> (1)(2)	ADC sampling time when reading the internal reference voltage	-	4.3	-	-	μs
t <sub>S_vbat</sub> (1)(2)	VBAT sampling time when reading the internal VBAT reference voltage	-	9	-	-	
I <sub>refbuf</sub> (2)	Reference Buffer consumption for ADC	V <sub>DDA</sub> =3.3 V	9	13.5	23	μA
ΔV <sub>REFINT</sub> (2)	Internal reference voltage spread over the temperature range	-40°C < T <sub>J</sub> < 140 °C	-	5	15	mV
T <sub>coeff</sub> (2)	Average temperature coefficient	Average temperature coefficient	-	20	70	ppm/°C
V <sub>DDcoeff</sub> (2)	Average Voltage coefficient	3.0V < V <sub>DD</sub> < 3.6V	-	10	1370	ppm/V

**Table 30. Embedded reference voltage (continued)**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
V <sub>REFINT_DIV1</sub>	1/4 reference voltage	-	-	25	-	% V <sub>REFINT</sub>
V <sub>REFINT_DIV2</sub>	1/2 reference voltage	-	-	50	-	
V <sub>REFINT_DIV3</sub>	3/4 reference voltage	-	-	75	-	

1. The shortest sampling time for the application can be determined by multiple iterations.
2. Guaranteed by design.

**Table 31. Internal reference voltage calibration values**

Symbol	Parameter	Memory address
V <sub>REFIN_CAL</sub>	Raw data acquired at temperature of 30 °C, V <sub>DDA</sub> = 3.3 V	1FF1E860 - 1FF1E861

### 6.3.7 Supply current characteristics

The current consumption is a function of several parameters and factors such as the operating voltage, ambient temperature, I/O pin loading, device software configuration, operating frequencies, I/O pin switching rate, program location in memory and executed binary code.

The current consumption is measured as described in [Figure 14: Current consumption measurement scheme](#).

All the run-mode current consumption measurements given in this section are performed with a CoreMark code.

#### Typical and maximum current consumption

The MCU is placed under the following conditions:

- All I/O pins are in analog input mode.
- All peripherals are disabled except when explicitly mentioned.
- The Flash memory access time is adjusted with the minimum wait states number, depending on the f<sub>ACLK</sub> frequency (refer to the table “Number of wait states according to CPU clock (f<sub>ICC\_CCK</sub>) frequency and V<sub>CORE</sub> range” available in the reference manual).
- When the peripherals are enabled, the AHB clock frequency is the CPU1 frequency divided by 2 and the APB clock frequency is AHB clock frequency divided by 2.

The parameters given in the below tables are derived from tests performed under ambient temperature and supply voltage conditions summarized in [Table 23: General operating conditions](#).

**Table 32. Typical and maximum current consumption in Run mode, code with data processing running from ITCM for Cortex-M7 core, and Flash memory for Cortex-M4 (ART accelerator ON), LDO regulator ON<sup>(1)(2)</sup>**

Symbol	Parameter	Conditions	Arm Cortex-M7 f <sub>CPU1</sub> (MHz)	Arm Cortex-M4 f <sub>CPU2</sub> (MHz)	Typ	Max <sup>(3)</sup>					Unit	
						T <sub>j</sub> = 25 °C	T <sub>j</sub> = 85 °C	T <sub>j</sub> = 105°C	T <sub>j</sub> = 125°C	T <sub>j</sub> = 140°C

Typical SMPS efficiency versus load current and temperature

Figure 17. Typical SMPS efficiency (%) vs load current (A) in Run mode at  $T_J = 30\text{ }^\circ\text{C}$

Figure 18. Typical SMPS efficiency (%) vs load current (A) in Run mode at  $T_J = T_{Jmax}$

Figure 19. Typical SMPS efficiency (%) vs load current (A) in low-power mode at  $T_J = 30\text{ }^\circ\text{C}$

Figure 20. Typical SMPS efficiency (%) vs load current (A) in low-power mode at  $T_J = T_{Jmax}$

**I/O system current consumption**

The current consumption of the I/O system has two components: static and dynamic.

**I/O static current consumption**

All the I/Os used as inputs with pull-up generate a current consumption when the pin is externally held low. The value of this current consumption can be simply computed by using the pull-up/pull-down resistors values given in [Table 69: I/O static characteristics](#).

For the output pins, any external pull-down or external load must also be considered to estimate the current consumption.

An additional I/O current consumption is due to I/Os configured as inputs if an intermediate voltage level is externally applied. This current consumption is caused by the input Schmitt trigger circuits used to discriminate the input value. Unless this specific configuration is required by the application, this supply current consumption can be avoided by configuring these I/Os in analog mode. This is notably the case of ADC input pins which should be configured as analog inputs.

**Caution:** Any floating input pin can also settle to an intermediate voltage level or switch inadvertently, as a result of external electromagnetic noise. To avoid a current consumption related to floating pins, they must either be configured in analog mode, or forced internally to a definite digital value. This can be done either by using pull-up/down resistors or by configuring the pins in output mode.

### I/O dynamic current consumption

In addition to the internal peripheral current consumption (see [Table 49: Peripheral current consumption in Run mode](#)), the I/Os used by an application also contribute to the current consumption. When an I/O pin switches, it uses the current from the MCU supply voltage to supply the I/O pin circuitry and to charge/discharge the capacitive load (internal or external) connected to the pin:

$$I_{SW} = V_{DDx} \times f_{SW} \times C_L$$

where

$I_{SW}$  is the current sunk by a switching I/O to charge/discharge the capacitive load

$V_{DDx}$  is the MCU supply voltage

$f_{SW}$  is the I/O switching frequency

$C_L$  is the total capacitance seen by the I/O pin:  $C = C_{INT} + C_{EXT}$

The test pin is configured in push-pull output mode and is toggled by software at a fixed frequency.

### On-chip peripheral current consumption

The MCU is placed under the following conditions:

- At startup, all I/O pins are in analog input configuration.
- All peripherals are disabled unless otherwise mentioned.
- The I/O compensation cell is enabled.
- $f_{rcc\_c\_ck}$  is the CPU clock.  $f_{PCLK} = f_{rcc\_c\_ck}/4$ , and  $f_{HCLK} = f_{rcc\_c\_ck}/2$ .  
The given value is calculated by measuring the difference of current consumption
  - with all peripherals clocked off
  - with only one peripheral clocked on
  - $f_{rcc\_c\_ck} = 480$  MHz (Scale 0),  $f_{rcc\_c\_ck} = 400$  MHz (Scale 1),  $f_{rcc\_c\_ck} = 300$  MHz (Scale 2),  $f_{rcc\_c\_ck} = 200$  MHz (Scale 3)
- The ambient operating temperature is 25 °C and  $V_{DD}=3.3$  V.

### 6.3.8 Wakeup time from low-power modes

The wakeup times given in [Table 50](#) are measured starting from the wakeup event trigger up to the first instruction executed by the CPU:

- For Stop or Sleep modes: the wakeup event is WFE.
- WKUP (PC1) pin is used to wakeup from Standby, Stop and Sleep modes.

All timings are derived from tests performed under ambient temperature and  $V_{DD}=3.3$  V.

**Table 50. Low-power mode wakeup timings<sup>(1)</sup>**

Symbol	Parameter	Conditions	Typ <sup>(2)</sup>	Max <sup>(2)</sup>	Unit
$t_{WUSLEEP}^{(3)}$	Wakeup from Sleep	-	9	10	CPU clock cycles
$t_{WUSTOP}^{(3)}$	Wakeup from Stop	VOS3, HSI, Flash memory in normal mode	4.4	5.6	μs
		VOS3, HSI, Flash memory in low-power mode	12	15	
		VOS4, HSI, Flash memory in normal mode	15	20	
		VOS4, HSI, Flash memory in low-power mode	23	28	
		VOS5, HSI, Flash memory in normal mode	39	71	
		VOS5, HSI, Flash memory in low-power mode	39	47	
		VOS3, CSI, Flash memory in normal mode	30	37	
		VOS3, CSI, Flash memory in low power mode	36	50	
		VOS4, CSI, Flash memory in normal mode	38	48	
		VOS4, CSI, Flash memory in low-power mode	47	61	
		VOS5, CSI, Flash memory in normal mode	68	75	
		VOS5, CSI, Flash memory in low-power mode	68	77	
$t_{WUSTOP\_KERON}^{(3)}$	Wakeup from Stop, clock kept running	VOS3, HSI, Flash memory in normal mode	2.6	3.4	μs
		VOS3, CSI, Flash memory in normal mode	26	36	
$t_{WUSTDBY}^{(3)}$	Wakeup from Standby mode	-	390	500	μs

1. The wakeup timings is valid for both CPUs.
2. Guaranteed by characterization results.
3. The wakeup times are measured from the wakeup event to the point in which the application code reads the first instruction.

### 6.3.9 External clock source characteristics

#### High-speed external user clock generated from an external source

In bypass mode the HSE oscillator is switched off and the input pin is a standard I/O.

The external clock signal has to respect the [Table 69: I/O static characteristics](#). However, the recommended clock input waveform is shown in [Figure 21](#).

**Table 51. High-speed external user clock characteristics<sup>(1)</sup>**

Symbol	Parameter	Min	Typ	Max	Unit
$f_{HSE\_ext}$	User external clock source frequency	4	25	50	MHz
$V_{SW}$ ( $V_{HSEH} - V_{HSEL}$ )	OSC_IN amplitude	$0.7V_{DD}$	-	$V_{DD}$	V
$V_{DC}$	OSC_IN input voltage	$V_{SS}$	-	$0.3V_{SS}$	
$t_{W(HSE)}$	OSC_IN high or low time	7	-	-	ns

1. Guaranteed by design.

**Figure 21. High-speed external clock source AC timing diagram**

**Low-speed external user clock generated from an external source**

In bypass mode the LSE oscillator is switched off and the input pin is a standard I/O. The external clock signal has to respect the [Table 69: I/O static characteristics](#). However, the recommended clock input waveform is shown in [Figure 22](#).

**Table 52. Low-speed external user clock characteristics<sup>(1)</sup>**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$f_{LSE\_ext}$	User external clock source frequency	-	-	32.768	1000	kHz
$V_{LSEH}$	OSC32_IN input pin high level voltage	-	$0.7 V_{DDIOx}$	-	$V_{DDIOx}$	V
$V_{LSEL}$	OSC32_IN input pin low level voltage	-	$V_{SS}$	-	$0.3 V_{DDIOx}$	
$t_{w(LSEH)}$ $t_{w(LSEL)}$	OSC32_IN high or low time	-	250	-	-	ns

1. Guaranteed by design.

**Note:** For information on selecting the crystal, refer to the application note AN2867 “Oscillator design guide for ST microcontrollers” available from the ST website [www.st.com](http://www.st.com).

**Figure 22. Low-speed external clock source AC timing diagram**

**High-speed external clock generated from a crystal/ceramic resonator**

The high-speed external (HSE) clock can be supplied with a 4 to 48 MHz crystal/ceramic resonator oscillator. All the information given in this paragraph are based on characterization results obtained with typical external components specified in [Table 53](#). In the application, the resonator and the load capacitors have to be placed as close as possible to the oscillator pins in order to minimize output distortion and startup stabilization time. Refer to the crystal resonator manufacturer for more details on the resonator characteristics (frequency, package, accuracy).

**Table 53. 4-48 MHz HSE oscillator characteristics<sup>(1)</sup>**

Symbol	Parameter	Operating conditions <sup>(2)</sup>	Min	Typ	Max	Unit
F	Oscillator frequency	-	4	-	48	MHz
R <sub>F</sub>	Feedback resistor	-	-	200	-	kΩ
I <sub>DD(HSE)</sub>	HSE current consumption	During startup <sup>(3)</sup>	-	-	4	mA
		V <sub>DD</sub> =3 V, R <sub>m</sub> =30 Ω C <sub>L</sub> =10pF@4MHz	-	0.35	-	
		V <sub>DD</sub> =3 V, R <sub>m</sub> =30 Ω C <sub>L</sub> =10 pF at 8 MHz	-	0.40	-	
		V <sub>DD</sub> =3 V, R <sub>m</sub> =30 Ω C <sub>L</sub> =10 pF at 16 MHz	-	0.45	-	
		V <sub>DD</sub> =3 V, R <sub>m</sub> =30 Ω C <sub>L</sub> =10 pF at 32 MHz	-	0.65	-	
		V <sub>DD</sub> =3 V, R <sub>m</sub> =30 Ω C <sub>L</sub> =10 pF at 48 MHz	-	0.95	-	
G <sub>m<sub>critmax</sub></sub>	Maximum critical crystal gm	Startup	-	-	1.5	mA/V
t <sub>SU</sub> <sup>(4)</sup>	Start-up time	V <sub>DD</sub> is stabilized	-	2	-	ms

1. Guaranteed by design.
2. Resonator characteristics given by the crystal/ceramic resonator manufacturer.
3. This consumption level occurs during the first 2/3 of the t<sub>SU(HSE)</sub> startup time.
4. t<sub>SU(HSE)</sub> is the startup time measured from the moment it is enabled (by software) to a stabilized 8 MHz oscillation is reached. This value is measured for a standard crystal resonator and it can vary significantly with the crystal manufacturer.

For C<sub>L1</sub> and C<sub>L2</sub>, it is recommended to use high-quality external ceramic capacitors in the 5 pF to 25 pF range (typical), designed for high-frequency applications, and selected to match the requirements of the crystal or resonator (see [Figure 23](#)). C<sub>L1</sub> and C<sub>L2</sub> are usually the same size. The crystal manufacturer typically specifies a load capacitance which is the series combination of C<sub>L1</sub> and C<sub>L2</sub>. The PCB and MCU pin capacitance must be included (10 pF can be used as a rough estimate of the combined pin and board capacitance) when sizing C<sub>L1</sub> and C<sub>L2</sub>.

*Note:* For information on selecting the crystal, refer to the application note AN2867 “Oscillator design guide for ST microcontrollers” available from the ST website [www.st.com](http://www.st.com).

Figure 23. Typical application with an 8 MHz crystal

1.  $R_{EXT}$  value depends on the crystal characteristics.

**Low-speed external clock generated from a crystal/ceramic resonator**

The low-speed external (LSE) clock can be supplied with a 32.768 kHz crystal/ceramic resonator oscillator. All the information given in this paragraph are based on characterization results obtained with typical external components specified in [Table 54](#). In the application, the resonator and the load capacitors have to be placed as close as possible to the oscillator pins in order to minimize output distortion and startup stabilization time. Refer to the crystal resonator manufacturer for more details on the resonator characteristics (frequency, package, accuracy).

Table 54. Low-speed external user clock characteristics<sup>(1)</sup>

Symbol	Parameter	Operating conditions <sup>(2)</sup>	Min	Typ	Max	Unit
F	Oscillator frequency	-	-	32.768	-	kHz
$I_{DD}$	LSE current consumption	LSEDRV[1:0] = 00, Low drive capability	-	290	-	nA
		LSEDRV[1:0] = 01, Medium Low drive capability	-	390	-	
		LSEDRV[1:0] = 10, Medium high drive capability	-	550	-	
		LSEDRV[1:0] = 11, High drive capability	-	900	-	
$G_{m_{critmax}}$	Maximum critical crystal gm	LSEDRV[1:0] = 00, Low drive capability	-	-	0.5	$\mu A/V$
		LSEDRV[1:0] = 01, Medium Low drive capability	-	-	0.75	
		LSEDRV[1:0] = 10, Medium high drive capability	-	-	1.7	
		LSEDRV[1:0] = 11, High drive capability	-	-	2.7	
$t_{SU}^{(3)}$	Startup time	VDD is stabilized	-	2	-	s

1. Guaranteed by design.
2. Refer to the note and caution paragraphs below the table, and to the application note AN2867 "Oscillator design guide for ST microcontrollers.
3.  $t_{SU}$  is the startup time measured from the moment it is enabled (by software) to a stabilized 32.768k Hz oscillation is reached. This value is measured for a standard crystal resonator and it can vary significantly with the crystal manufacturer.

Note: For information on selecting the crystal, refer to the application note AN2867 “Oscillator design guide for ST microcontrollers” available from the ST website [www.st.com](http://www.st.com).

Figure 24. Typical application with a 32.768 kHz crystal

1. An external resistor is not required between OSC32\_IN and OSC32\_OUT and it is forbidden to add one.

### 6.3.10 Internal clock source characteristics

The parameters given in [Table 55](#) to [Table 58](#) are derived from tests performed under ambient temperature and  $V_{DD}$  supply voltage conditions summarized in [Table 23: General operating conditions](#).

#### 48 MHz high-speed internal RC oscillator (HSI48)

Table 55. HSI48 oscillator characteristics

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$f_{HSI48}$	HSI48 frequency	$V_{DD}=3.3\text{ V}$ , $T_J=30\text{ }^\circ\text{C}$	47.5 <sup>(1)</sup>	48	48.5 <sup>(1)</sup>	MHz
TRIM <sup>(2)</sup>	USER trimming step	-	-	0.175	-	%
USER TRIM COVERAGE <sup>(3)</sup>	USER TRIMMING Coverage	$\pm 32$ steps	$\pm 4.79$	$\pm 5.60$	-	%
DuCy(HSI48) <sup>(2)</sup>	Duty Cycle	-	45	-	55	%
ACC_HSI48_REL <sup>(3)(4)</sup>	Accuracy of the HSI48 oscillator over temperature (factory calibrated)	$T_J=-40\text{ to }125\text{ }^\circ\text{C}$	-4.5	-	3.5	%
		$T_J=-40\text{ to }140\text{ }^\circ\text{C}$	-4.5	-	4	
$\Delta V_{DD}(\text{HSI48})$ <sup>(3)</sup>	HSI48 oscillator frequency drift with $V_{DD}$ <sup>(5)</sup>	$V_{DD}=3\text{ to }3.6\text{ V}$	-	0.025	0.05	%
		$V_{DD}=1.62\text{ V to }3.6\text{ V}$	-	0.05	0.1	
$t_{su}(\text{HSI48})$ <sup>(2)</sup>	HSI48 oscillator start-up time	-	-	2.1	4.0	$\mu\text{s}$
$I_{DD}(\text{HSI48})$ <sup>(2)</sup>	HSI48 oscillator power consumption	-	-	350	400	$\mu\text{A}$
$N_T$ jitter	Next transition jitter Accumulated jitter on 28 cycles <sup>(6)</sup>	-	-	$\pm 0.15$	-	ns
$P_T$ jitter	Paired transition jitter Accumulated jitter on 56 cycles <sup>(6)</sup>	-	-	$\pm 0.25$	-	ns

1. Guaranteed by test in production.
2. Guaranteed by design.
3. Guaranteed by characterization.
4.  $\Delta f_{HSI} = \text{ACC\_HSI48\_REL} + \Delta V_{DD}$ .

5. These values are obtained by using the formula:  $(\text{Freq}(3.6\text{V}) - \text{Freq}(3.0\text{V})) / \text{Freq}(3.0\text{V})$  or  $(\text{Freq}(3.6\text{V}) - \text{Freq}(1.62\text{V})) / \text{Freq}(1.62\text{V})$ .
6. Jitter measurements are performed without clock source activated in parallel.

### 64 MHz high-speed internal RC oscillator (HSI)

Table 56. HSI oscillator characteristics<sup>(1)</sup>

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$f_{\text{HSI}}$	HSI frequency	$V_{\text{DD}}=3.3\text{ V}$ , $T_{\text{J}}=30\text{ °C}$	63.7 <sup>(2)</sup>	64	64.3 <sup>(2)</sup>	MHz
TRIM	HSI user trimming step	Trimming is not a multiple of 32	-	0.24	0.32	%
		Trimming is 128, 256 and 384	-5.2	-1.8	-	
		Trimming is 64, 192, 320 and 448	-1.4	-0.8	-	
		Other trimming are a multiple of 32 (not including multiple of 64 and 128)	-0.6	-0.25	-	
DuCy(HSI)	Duty Cycle	-	45	-	55	%
$\Delta_{\text{VDD}}(\text{HSI})$	HSI oscillator frequency drift over $V_{\text{DD}}$ (reference is 3.3 V)	$V_{\text{DD}}=1.62\text{ to }3.6\text{ V}$	-0.12	-	0.03	%
$\Delta_{\text{TEMP}}(\text{HSI})$	HSI oscillator frequency drift over temperature (reference is 64 MHz)	$T_{\text{J}}=-20\text{ to }105\text{ °C}$	-1 <sup>(3)</sup>	-	1 <sup>(3)</sup>	%
		$T_{\text{J}}=-40\text{ to }T_{\text{Jmax}}\text{ °C}$	-2 <sup>(3)</sup>	-	1 <sup>(3)</sup>	
$t_{\text{su}}(\text{HSI})$	HSI oscillator start-up time	-	-	1.4	2	$\mu\text{s}$
$t_{\text{stab}}(\text{HSI})$	HSI oscillator stabilization time	at 1% of target frequency	-	4	8	$\mu\text{s}$
$I_{\text{DD}}(\text{HSI})$	HSI oscillator power consumption	-	-	300	400	$\mu\text{A}$

1. Guaranteed by design unless otherwise specified.
2. Guaranteed by test in production.
3. Guaranteed by characterization.

### 4 MHz low-power internal RC oscillator (CSI)

Table 57. CSI oscillator characteristics<sup>(1)</sup>

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$f_{\text{CSI}}$	CSI frequency	$V_{\text{DD}}=3.3\text{ V}$ , $T_{\text{J}}=30\text{ °C}$	3.96 <sup>(2)</sup>	4	4.04 <sup>(2)</sup>	MHz
TRIM	Trimming step	-	-	0.35	-	%
DuCy(CSI)	Duty Cycle	-	45	-	55	%
$\Delta_{\text{TEMP}}(\text{CSI})$	CSI oscillator frequency drift over temperature	$T_{\text{J}} = 0\text{ to }85\text{ °C}$	-	-3.7 <sup>(3)</sup>	4.5 <sup>(3)</sup>	%
		$T_{\text{J}} = -40\text{ to }140\text{ °C}$	-	-11 <sup>(3)</sup>	7.5 <sup>(3)</sup>	
$\Delta_{\text{VDD}}(\text{CSI})$	CSI oscillator frequency drift over $V_{\text{DD}}$	$V_{\text{DD}} = 1.62\text{ to }3.6\text{ V}$	-	-0.06	0.06	%

**Table 57. CSI oscillator characteristics<sup>(1)</sup> (continued)**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$t_{su(CSI)}$	CSI oscillator startup time	-	-	1	2	$\mu s$
$t_{stab(CSI)}$	CSI oscillator stabilization time (to reach $\pm 3\%$ of $f_{CSI}$ )	-	-	-	4	cycle
$I_{DD(CSI)}$	CSI oscillator power consumption	-	-	23	30	$\mu A$

1. Guaranteed by design.
2. Guaranteed by test in production.
3. Guaranteed by characterization.

**Low-speed internal (LSI) RC oscillator**

**Table 58. LSI oscillator characteristics**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$f_{LSI}$	LSI frequency	$V_{DD} = 3.3 V, T_J = 25\text{ }^\circ C$	31.4 <sup>(1)</sup>	32	32.6 <sup>(1)</sup>	kHz
		$T_J = -40\text{ to }110\text{ }^\circ C, V_{DD} = 1.62\text{ to }3.6 V$	29.76 <sup>(2)</sup>	-	33.6 <sup>(2)</sup>	
		$T_J = -40\text{ to }125\text{ }^\circ C, V_{DD} = 1.62\text{ to }3.6 V$	29.4	-	33.6	
		$T_J = -40\text{ to }140\text{ }^\circ C, V_{DD} = 1.62\text{ to }3.6 V$	29.4	-	33.6	
$t_{su(LSI)}^{(3)}$	LSI oscillator startup time	-	-	80	130	$\mu s$
$t_{stab(LSI)}^{(3)}$	LSI oscillator stabilization time (5% of final value)	-	-	120	170	
$I_{DD(LSI)}^{(3)}$	LSI oscillator power consumption	-	-	130	280	

1. Guaranteed by test in production.
2. Guaranteed by characterization results.
3. Guaranteed by design.

### 6.3.11 PLL characteristics

The parameters given in [Table 59](#) are derived from tests performed under temperature and  $V_{DD}$  supply voltage conditions summarized in [Table 23: General operating conditions](#).

**Table 59. PLL characteristics (wide VCO frequency range)<sup>(1)</sup>**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit	
$f_{PLL\_IN}$	PLL input clock	-	2	-	16	MHz	
	PLL input clock duty cycle	-	10	-	90	%	
$f_{PLL\_P\_OUT}$	PLL multiplier output clock P	VOS0	1.5	-	480 <sup>(2)</sup>	MHz	
		VOS1	1.5	-	400 <sup>(2)</sup>		
		VOS2	1.5	-	300 <sup>(2)</sup>		
		VOS3	1.5	-	200 <sup>(2)</sup>		
$f_{VCO\_OUT}$	PLL VCO output	-	192	-	960		
$t_{LOCK}$	PLL lock time	Normal mode	-	50 <sup>(3)</sup>	150 <sup>(3)</sup>	$\mu$ s	
		Sigma-delta mode (CKIN $\geq$ 8 MHz)	-	58 <sup>(3)</sup>	166 <sup>(3)</sup>		
Jitter	Cycle-to-cycle jitter <sup>(4)</sup>	-	VCO = 192 MHz	-	134	-	$\pm$ ps
			VCO = 200 MHz	-	134	-	
			VCO = 400 MHz	-	76	-	
			VCO = 800 MHz	-	39	-	
	Long term jitter	Normal mode	VCO = 800 MHz	-	$\pm$ 0.7	-	%
			Sigma-delta mode (CKIN = 16 MHz)	VCO = 800 MHz	-	$\pm$ 0.8	
$I_{DD(PLL)}$ <sup>(3)</sup>	PLL power consumption on $V_{DD}$	VCO freq = 836 MHz	$V_{DDA}$	-	590	1500	$\mu$ A
			$V_{CORE}$	-	720	-	
		VCO freq = 192 MHz	$V_{DDA}$	-	180	600	
			$V_{CORE}$	-	280	-	

1. Guaranteed by design unless otherwise specified.
2. This value must be limited to the maximum frequency due to the product limitation (480 MHz for VOS0, 400 MHz for VOS1, 300 MHz for VOS2, 200 MHz for VOS3).
3. Guaranteed by characterization results.
4. Integer mode only.

Table 60. PLL characteristics (medium VCO frequency range)<sup>(1)</sup>

Symbol	Parameter	Conditions	Min	Typ	Max	Unit	
f <sub>PLL_IN</sub>	PLL input clock	-	1	-	2	MHz	
	PLL input clock duty cycle	-	10	-	90	%	
f <sub>PLL_OUT</sub>	PLL multiplier output clock P, Q, R	VOS1	1.17	-	210	MHz	
		VOS2	1.17	-	210		
		VOS3	1.17	-	200		
f <sub>VCO_OUT</sub>	PLL VCO output	-	150	-	420		
t <sub>LOCK</sub>	PLL lock time	Normal mode	-	60 <sup>(2)</sup>	100 <sup>(2)</sup>	μs	
		Sigma-delta mode	forbidden				
Jitter	Cycle-to-cycle jitter <sup>(3)</sup>	-	VCO = 150 MHz	-	145	-	±ps
			VCO = 300 MHz	-	91	-	
			VCO = 400 MHz	-	64	-	
			VCO = 420 MHz	-	63	-	
	Period jitter	f <sub>PLL_OUT</sub> = 50 MHz	VCO = 150 MHz	-	55	-	±-ps
			VCO = 400 MHz	-	30	-	
Long term jitter	Normal mode	VCO = 400 MHz	-	±0.3	-	%	
I(PLL) <sup>(2)</sup>	PLL power consumption on V <sub>DD</sub>	VCO freq = 420MHz	VDD	-	440	1150	μA
			VCORE	-	530	-	
		VCO freq = 150MHz	VDD	-	180	500	
			VCORE	-	200	-	

1. Guaranteed by design unless otherwise specified.
2. Guaranteed by characterization results.
3. Integer mode only.

### 6.3.12 Memory characteristics

#### Flash memory

The characteristics are given at  $T_J = -40$  to  $125$  °C unless otherwise specified.

The devices are shipped to customers with the Flash memory erased.

**Table 61. Flash memory characteristics**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$I_{DD}$	Supply current	Write / Erase 8-bit mode	-	6.5	-	mA
		Write / Erase 16-bit mode	-	11.5	-	
		Write / Erase 32-bit mode	-	20	-	
		Write / Erase 64-bit mode	-	35	-	

**Table 62. Flash memory programming (single bank configuration nDBANK=1)**

Symbol	Parameter	Conditions	Min <sup>(1)</sup>	Typ	Max <sup>(1)</sup>	Unit
$t_{prog}$	Word (266 bits) programming time	Program/erase parallelism x 8	-	290	580 <sup>(2)</sup>	$\mu$ s
		Program/erase parallelism x 16	-	180	360	
		Program/erase parallelism x 32	-	130	260	
		Program/erase parallelism x 64	-	100	200	
$t_{ERASE128KB}$	Sector (128 KB) erase time	Program/erase parallelism x 8	-	2	4	s
		Program/erase parallelism x 16	-	1.8	3.6	
		Program/erase parallelism x 32	-			
$t_{ME}$	Mass erase time	Program/erase parallelism x 8	-	13	26	s
		Program/erase parallelism x 16	-	8	16	
		Program/erase parallelism x 32	-	6	12	
		Program/erase parallelism x 64	-	5	10	
$V_{prog}$	Programming voltage	Program parallelism x 8	1.62	-	3.6	V
		Program parallelism x 16				
		Program parallelism x 32				
		Program parallelism x 64	1.8	-	3.6	

1. Guaranteed by characterization results.
2. The maximum programming time is measured after 10K erase operations.

**Table 63. Flash memory endurance and data retention**

Symbol	Parameter	Conditions	Value	Unit
			Min <sup>(1)</sup>	
N <sub>END</sub>	Endurance	T <sub>J</sub> = -40 to +125 °C (6 suffix versions)	10	kcycles
t <sub>RET</sub>	Data retention	1 kcycle at T <sub>A</sub> = 85 °C	30	Years
		10 kcycles at T <sub>A</sub> = 55 °C	20	

1. Guaranteed by characterization results.

### 6.3.13 EMC characteristics

Susceptibility tests are performed on a sample basis during device characterization.

#### Functional EMS (electromagnetic susceptibility)

While a simple application is executed on the device (toggling 2 LEDs through I/O ports), the device is stressed by two electromagnetic events until a failure occurs. The failure is indicated by the LEDs:

- **Electrostatic discharge (ESD)** (positive and negative) is applied to all device pins until a functional disturbance occurs. This test is compliant with the IEC 61000-4-2 standard.
- **FTB:** A burst of fast transient voltage (positive and negative) is applied to V<sub>DD</sub> and V<sub>SS</sub> through a 100 pF capacitor, until a functional disturbance occurs. This test is compliant with the IEC 61000-4-4 standard.

A device reset allows normal operations to be resumed.

The test results are given in [Table 64](#). They are based on the EMS levels and classes defined in application note AN1709.

**Table 64. EMS characteristics**

Symbol	Parameter	Conditions	Level/Class
V <sub>FESD</sub>	Voltage limits to be applied on any I/O pin to induce a functional disturbance	V <sub>DD</sub> = 3.3 V, T <sub>A</sub> = +25 °C, UFBGA240, f <sub>rcc_ck</sub> = 400 MHz, conforms to IEC 61000-4-2	3B
V <sub>FTB</sub>	Fast transient voltage burst limits to be applied through 100 pF on V <sub>DD</sub> and V <sub>SS</sub> pins to induce a functional disturbance		5A

As a consequence, it is recommended to add a serial resistor (1 kΩ) located as close as possible to the MCU to the pins exposed to noise (connected to tracks longer than 50 mm on PCB).

**Designing hardened software to avoid noise problems**

EMC characterization and optimization are performed at component level with a typical application environment and simplified MCU software. It should be noted that good EMC performance is highly dependent on the user application and the software in particular.

Therefore it is recommended that the user applies EMC software optimization and prequalification tests in relation with the EMC level requested for his application.

**Software recommendations**

The software flowchart must include the management of runaway conditions such as:

- Corrupted program counter
- Unexpected reset
- Critical Data corruption (control registers...)

**Prequalification trials**

Most of the common failures (unexpected reset and program counter corruption) can be reproduced by manually forcing a low state on the NRST pin or the Oscillator pins for 1 second.

To complete these trials, ESD stress can be applied directly on the device, over the range of specification values. When unexpected behavior is detected, the software can be hardened to prevent unrecoverable errors occurring (see application note AN1015).

**Electromagnetic Interference (EMI)**

The electromagnetic field emitted by the device are monitored while a simple application, executing EEMBC code, is running. This emission test is compliant with SAE IEC61967-2 standard which specifies the test board and the pin loading.

**Table 65. EMI characteristics**

Symbol	Parameter	Conditions	Monitored frequency band	Max vs. [f <sub>HSE</sub> /f <sub>CPU</sub> ]	Unit
				8/400 MHz	
S <sub>EMI</sub>	Peak level	V <sub>DD</sub> = 3.6 V, T <sub>A</sub> = 25 °C, UFBGA240 package, conforming to IEC61967-2	0.1 to 30 MHz	11	dBμV
			30 to 130 MHz	6	
			130 MHz to 1 GHz	12	
			1 GHz to 2 GHz	7	
			EMI Level	2.5	-

### 6.3.14 Absolute maximum ratings (electrical sensitivity)

Based on three different tests (ESD, LU) using specific measurement methods, the device is stressed in order to determine its performance in terms of electrical sensitivity.

#### Electrostatic discharge (ESD)

Electrostatic discharges (a positive then a negative pulse) are applied to the pins of each sample according to each pin combination. This test conforms to the ANSI/ESDA/JEDEC JS-001 and ANSI/ESDA/JEDEC JS-002 standards.

**Table 66. ESD absolute maximum ratings**

Symbol	Ratings	Conditions	Packages	Class	Maximum value <sup>(1)</sup>	Unit
V <sub>ESD(HBM)</sub>	Electrostatic discharge voltage (human body model)	T <sub>A</sub> = +25 °C conforming to ANSI/ESDA/JEDEC JS-001	All	1C	1000	V
V <sub>ESD(CDM)</sub>	Electrostatic discharge voltage (charge device model)	T <sub>A</sub> = +25 °C conforming to ANSI/ESDA/JEDEC JS-002	All	C1	250	

1. Guaranteed by characterization results.

#### Static latchup

Two complementary static tests are required on six parts to assess the latchup performance:

- A supply overvoltage is applied to each power supply pin
- A current injection is applied to each input, output and configurable I/O pin

These tests are compliant with JESD78 IC latchup standard.

**Table 67. Electrical sensitivities**

Symbol	Parameter	Conditions	Class
LU	Static latchup class	T <sub>A</sub> = +25 °C conforming to JESD78	II level A

### 6.3.15 I/O current injection characteristics

As a general rule, a current injection to the I/O pins, due to external voltage below  $V_{SS}$  or above  $V_{DD}$  (for standard, 3.3 V-capable I/O pins) should be avoided during the normal product operation. However, in order to give an indication of the robustness of the microcontroller in cases when an abnormal injection accidentally happens, susceptibility tests are performed on a sample basis during the device characterization.

#### Functional susceptibility to I/O current injection

While a simple application is executed on the device, the device is stressed by injecting current into the I/O pins programmed in floating input mode. While current is injected into the I/O pin, one at a time, the device is checked for functional failures.

The failure is indicated by an out of range parameter: ADC error above a certain limit (higher than 5 LSB TUE), out of conventional limits of induced leakage current on adjacent pins (out of  $-5 \mu A/+0 \mu A$  range), or other functional failure (for example reset, oscillator frequency deviation).

The following tables are the compilation of the SIC1/SIC2 and functional ESD results.

Negative induced A negative induced leakage current is caused by negative injection and positive induced leakage current by positive injection.

**Table 68. I/O current injection susceptibility<sup>(1)</sup>**

Symbol	Description	Functional susceptibility		Unit
		Negative injection	Positive injection	
$I_{INJ}$	PA7, PC5, PG1, PB14, PJ7, PA11, PA12, PA13, PA14, PA15, PJ12, PB4	5	0	mA
	PA2, PH2, PH3, PE8, PA6, PA7, PC4, PE7, PE10, PE11	0	NA	
	PA0, PA_C, PA1, PA1_C, PC2, PC2_C, PC3, PC3_C, PA4, PA5, PH4, PH5, BOOT0	0	0	
	All other I/Os	5	NA	

1. Guaranteed by characterization.

### 6.3.16 I/O port characteristics

#### General input/output characteristics

Unless otherwise specified, the parameters given in [Table 69: I/O static characteristics](#) are derived from tests performed under the conditions summarized in [Table 23: General operating conditions](#). All I/Os are CMOS and TTL compliant (except for BOOT0).

**Table 69. I/O static characteristics**

Symbol	Parameter	Condition	Min	Typ	Max	Unit
V <sub>IL</sub>	I/O input low level voltage except BOOT0	1.62 V < V <sub>DDIOx</sub> < 3.6 V	-	-	0.3V <sub>DD</sub> <sup>(1)</sup>	V
	I/O input low level voltage except BOOT0		-	-	0.4V <sub>DD</sub> -0.1 <sup>(2)</sup>	
	BOOT0 I/O input low level voltage		-	-	0.19V <sub>DD</sub> +0.1 <sup>(2)</sup>	
V <sub>IH</sub>	I/O input high level voltage except BOOT0	1.62 V < V <sub>DDIOx</sub> < 3.6 V	0.7V <sub>DD</sub> <sup>(1)</sup>	-	-	V
	I/O input high level voltage except BOOT0 <sup>(3)</sup>		0.47V <sub>DD</sub> +0.25 <sup>(2)</sup>	-	-	
	BOOT0 I/O input high level voltage <sup>(3)</sup>		0.17V <sub>DD</sub> +0.6 <sup>(2)</sup>	-	-	
V <sub>HYS</sub> <sup>(2)</sup>	TT_xx, FT_XXX and NRST I/O input hysteresis	1.62 V < V <sub>DDIOx</sub> < 3.6 V	-	250	-	mV
	BOOT0 I/O input hysteresis		-	200	-	
I <sub>leak</sub> <sup>(4)</sup>	FT_xx Input leakage current <sup>(2)</sup>	0 < V <sub>IN</sub> ≤ Max(V <sub>DDXXX</sub> ) <sup>(9)</sup>	-	-	+/-250	nA
		Max(V <sub>DDXXX</sub> ) < V <sub>IN</sub> ≤ 5.5 V <sup>(5)(6)(9)</sup>	-	-	1500	
	FT_u IO	0 < V <sub>IN</sub> ≤ Max(V <sub>DDXXX</sub> ) <sup>(9)</sup>	-	-	+/- 350	
		Max(V <sub>DDXXX</sub> ) < V <sub>IN</sub> ≤ 5.5 V <sup>(5)(6)(9)</sup>	-	-	5000 <sup>(7)</sup>	
	TT_xx Input leakage current	0 < V <sub>IN</sub> ≤ Max(V <sub>DDXXX</sub> ) <sup>(9)</sup>	-	-	+/-250	
	VPP (BOOT0 alternate function)	0 < V <sub>IN</sub> ≤ V <sub>DDIOx</sub>	-	-	15	
V <sub>DDIOx</sub> < V <sub>IN</sub> ≤ 9 V		-	-	35		
R <sub>PU</sub>	Weak pull-up equivalent resistor <sup>(8)</sup>	V <sub>IN</sub> =V <sub>SS</sub>	30	40	50	kΩ
R <sub>PD</sub>	Weak pull-down equivalent resistor <sup>(8)</sup>	V <sub>IN</sub> =V <sub>DD</sub> <sup>(9)</sup>	30	40	50	
C <sub>IO</sub>	I/O pin capacitance	-	-	5	-	pF

1. Compliant with CMOS requirements.
2. Guaranteed by design.
3. V<sub>DDIOx</sub> represents V<sub>DDIO1</sub>, V<sub>DDIO2</sub> or V<sub>DDIO3</sub>. V<sub>DDIOx</sub>= V<sub>DD</sub>.
4. This parameter represents the pad leakage of the I/O itself. The total product pad leakage is provided by the following formula: I<sub>Total\_Leak\_max</sub> = 10 μA + [number of I/Os where V<sub>IN</sub> is applied on the pad] × I<sub>Ikg(Max)</sub>.
5. All FT\_xx IO except FT\_lu, FT\_u and PC3.

6.  $V_{IN}$  must be less than  $\text{Max}(V_{DDXXX}) + 3.6 \text{ V}$ .
7. To sustain a voltage higher than  $\text{MIN}(V_{DD}, V_{DDA}, V_{DD33USB}) + 0.3 \text{ V}$ , the internal pull-up and pull-down resistors must be disabled.
8. The pull-up and pull-down resistors are designed with a true resistance in series with a switchable PMOS/NMOS. This PMOS/NMOS contribution to the series resistance is minimal (~10% order).
9.  $\text{Max}(V_{DDXXX})$  is the maximum value of all the I/O supplies.

All I/Os are CMOS and TTL compliant (no software configuration required). Their characteristics cover more than the strict CMOS-technology or TTL parameters. The coverage of these requirements for FT I/Os is shown in [Figure 25](#).

**Figure 25.  $V_{IL}/V_{IH}$  for all I/Os except BOOT0**

**Output driving current**

The GPIOs (general purpose input/outputs) can sink or source up to  $\pm 8 \text{ mA}$ , and sink or source up to  $\pm 20 \text{ mA}$  (with a relaxed  $V_{OL}/V_{OH}$ ).

In the user application, the number of I/O pins which can drive current must be limited to respect the absolute maximum rating specified in [Section 6.2](#). In particular:

- The sum of the currents sourced by all the I/Os on  $V_{DD}$ , plus the maximum Run consumption of the MCU sourced on  $V_{DD}$ , cannot exceed the absolute maximum rating  $\Sigma I_{VDD}$  (see [Table 21](#)).
- The sum of the currents sunk by all the I/Os on  $V_{SS}$  plus the maximum Run consumption of the MCU sunk on  $V_{SS}$  cannot exceed the absolute maximum rating  $\Sigma I_{VSS}$  (see [Table 21](#)).

**Output voltage levels**

Unless otherwise specified, the parameters given in [Table 70: Output voltage characteristics for all I/Os except PC13, PC14, PC15 and PI8](#) and [Table 71: Output voltage characteristics for PC13, PC14, PC15 and PI8](#) are derived from tests performed under ambient temperature and V<sub>DD</sub> supply voltage conditions summarized in [Table 23: General operating conditions](#). All I/Os are CMOS and TTL compliant.

**Table 70. Output voltage characteristics for all I/Os except PC13, PC14, PC15 and PI8<sup>(1)</sup>**

Symbol	Parameter	Conditions <sup>(3)</sup>	Min	Max	Unit
V <sub>OL</sub>	Output low level voltage	CMOS port <sup>(2)</sup> I <sub>IO</sub> =8 mA 2.7 V ≤ V <sub>DD</sub> ≤ 3.6 V	-	0.4	V
V <sub>OH</sub>	Output high level voltage	CMOS port <sup>(2)</sup> I <sub>IO</sub> =-8 mA 2.7 V ≤ V <sub>DD</sub> ≤ 3.6 V	V <sub>DD</sub> -0.4	-	
V <sub>OL</sub> <sup>(3)</sup>	Output low level voltage	TTL port <sup>(2)</sup> I <sub>IO</sub> =8 mA 2.7 V ≤ V <sub>DD</sub> ≤ 3.6 V	-	0.4	
V <sub>OH</sub> <sup>(3)</sup>	Output high level voltage	TTL port <sup>(2)</sup> I <sub>IO</sub> =-8 mA 2.7 V ≤ V <sub>DD</sub> ≤ 3.6 V	2.4	-	
V <sub>OL</sub> <sup>(3)</sup>	Output low level voltage	I <sub>IO</sub> =20 mA 2.7 V ≤ V <sub>DD</sub> ≤ 3.6 V	-	1.3	
V <sub>OH</sub> <sup>(3)</sup>	Output high level voltage	I <sub>IO</sub> =-20 mA 2.7 V ≤ V <sub>DD</sub> ≤ 3.6 V	V <sub>DD</sub> -1.3	-	
V <sub>OL</sub> <sup>(3)</sup>	Output low level voltage	I <sub>IO</sub> =4 mA 1.62 V ≤ V <sub>DD</sub> ≤ 3.6 V	-	0.4	
V <sub>OH</sub> <sup>(3)</sup>	Output high level voltage	I <sub>IO</sub> =-4 mA 1.62 V ≤ V <sub>DD</sub> < 3.6 V	V <sub>DD</sub> -0.4	-	
V <sub>OLFM+</sub> <sup>(3)</sup>	Output low level voltage for an FTf I/O pin in FM+ mode	I <sub>IO</sub> = 20 mA 2.3 V ≤ V <sub>DD</sub> ≤ 3.6 V	-	0.4	
		I <sub>IO</sub> = 10 mA 1.62 V ≤ V <sub>DD</sub> ≤ 3.6 V	-	0.4	

1. The IIO current sourced or sunk by the device must always respect the absolute maximum rating specified in [Table 20: Voltage characteristics](#), and the sum of the currents sourced or sunk by all the I/Os (I/O ports and control pins) must always respect the absolute maximum ratings ΣIIO.
2. TTL and CMOS outputs are compatible with JEDEC standards JESD36 and JESD52.
3. Guaranteed by design.

Table 71. Output voltage characteristics for PC13, PC14, PC15 and PI8<sup>(1)</sup>

Symbol	Parameter	Conditions <sup>(3)</sup>	Min	Max	Unit
V <sub>OL</sub>	Output low level voltage	CMOS port <sup>(2)</sup> I <sub>IO</sub> =3 mA 2.7 V ≤ V <sub>DD</sub> ≤ 3.6 V	-	0.4	V
V <sub>OH</sub>	Output high level voltage	CMOS port <sup>(2)</sup> I <sub>IO</sub> =-3 mA 2.7 V ≤ V <sub>DD</sub> ≤ 3.6 V	V <sub>DD</sub> -0.4	-	
V <sub>OL</sub> <sup>(3)</sup>	Output low level voltage	TTL port <sup>(2)</sup> I <sub>IO</sub> =3 mA 2.7 V ≤ V <sub>DD</sub> ≤ 3.6 V	-	0.4	
V <sub>OH</sub> <sup>(2)</sup>	Output high level voltage	TTL port <sup>(2)</sup> I <sub>IO</sub> =-3 mA 2.7 V ≤ V <sub>DD</sub> ≤ 3.6 V	2.4	-	
V <sub>OL</sub> <sup>(2)</sup>	Output low level voltage	I <sub>IO</sub> =1.5 mA 1.62 V ≤ V <sub>DD</sub> ≤ 3.6 V	-	0.4	
V <sub>OH</sub> <sup>(2)</sup>	Output high level voltage	I <sub>IO</sub> =-1.5 mA 1.62 V ≤ V <sub>DD</sub> ≤ 3.6 V	V <sub>DD</sub> -0.4	-	

1. The IIO current sourced or sunk by the device must always respect the absolute maximum rating specified in [Table 20: Voltage characteristics](#), and the sum of the currents sourced or sunk by all the I/Os (I/O ports and control pins) must always respect the absolute maximum ratings ΣIIO.
2. TTL and CMOS outputs are compatible with JEDEC standards JESD36 and JESD52.
3. Guaranteed by design.

**Output buffer timing characteristics (HSLV option disabled)**

The HSLV bit of SYSCFG\_CCCSR register can be used to optimize the I/O speed when the product voltage is below 2.7 V.

**Table 72. Output timing characteristics (HSLV OFF)<sup>(1)(2)</sup>**

			C=30 pF, 1.62 V ≤ V <sub>DD</sub> ≤ 2.7 V <sup>(4)</sup>	-	1.9	

1. Guaranteed by design.
2. The maximum frequency is defined with the following conditions:  
 (t<sub>r</sub>+t<sub>f</sub>) ≤ 2/3 T  
 Skew ≤ 1/20 T  
 45% < Duty cycle < 55%
3. The fall and rise times are defined between 90% and 10% and between 10% and 90% of the output waveform, respectively.
4. Compensation system enabled.

### 6.3.17 NRST pin characteristics

The NRST pin input driver uses CMOS technology. It is connected to a permanent pull-up resistor,  $R_{PU}$  (see [Table 69: I/O static characteristics](#)).

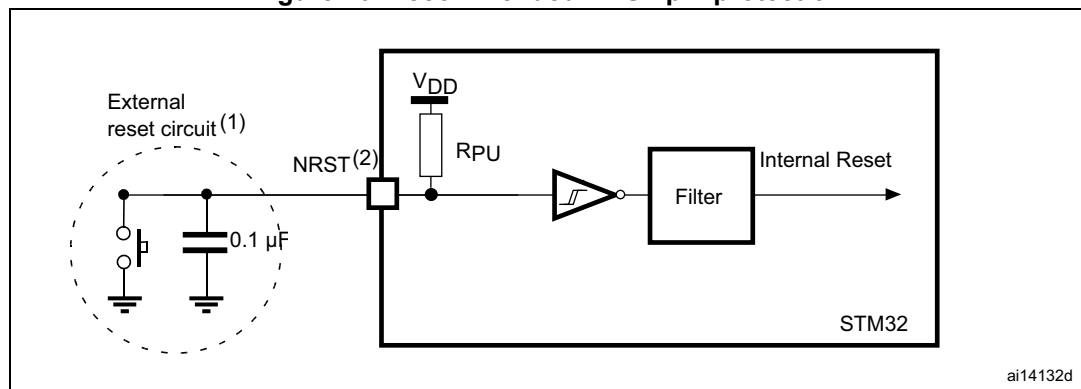

Unless otherwise specified, the parameters given in [Table 74](#) are derived from tests performed under the ambient temperature and  $V_{DD}$  supply voltage conditions summarized in [Table 23: General operating conditions](#).

**Table 74. NRST pin characteristics**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$R_{PU}^{(2)}$	Weak pull-up equivalent resistor <sup>(1)</sup>	$V_{IN} = V_{SS}$	30	40	50	k $\Omega$
$V_{F(NRST)}^{(2)}$	NRST Input filtered pulse	$1.71\text{ V} < V_{DD} < 3.6\text{ V}$	-	-	50	ns
$V_{NF(NRST)}^{(2)}$	NRST Input not filtered pulse	$1.71\text{ V} < V_{DD} < 3.6\text{ V}$	300	-	-	
		$1.62\text{ V} < V_{DD} < 3.6\text{ V}$	1000	-	-	

1. The pull-up is designed with a true resistance in series with a switchable PMOS. This PMOS contribution to the series resistance must be minimum (~10% order).
2. Guaranteed by design.

**Figure 26. Recommended NRST pin protection**

1. The reset network protects the device against parasitic resets.
2. The user must ensure that the level on the NRST pin can go below the  $V_{IL(NRST)}$  max level specified in [Table 69](#). Otherwise the reset is not taken into account by the device.

### 6.3.18 FMC characteristics

Unless otherwise specified, the parameters given in [Table 75](#) to [Table 88](#) for the FMC interface are derived from tests performed under the ambient temperature,  $f_{HCLK}$  frequency and  $V_{DD}$  supply voltage conditions summarized in [Table 23: General operating conditions](#), with the following configuration:

- Output speed is set to  $OSPEEDRy[1:0] = 11$
- Measurement points are done at CMOS levels:  $0.5V_{DD}$
- IO Compensation cell activated.
- HSLV activated when  $V_{DD} \leq 2.7\text{ V}$
- VOS level set to VOS1.

Refer to [Section 6.3.16: I/O port characteristics](#) for more details on the input/output alternate function characteristics.

**Asynchronous waveforms and timings**

[Figure 27](#) through [Figure 29](#) represent asynchronous waveforms and [Table 75](#) through [Table 82](#) provide the corresponding timings. The results shown in these tables are obtained with the following FMC configuration:

- AddressSetupTime = 0x1
- AddressHoldTime = 0x1
- DataSetupTime = 0x1 (except for asynchronous NWAIT mode , DataSetupTime = 0x5)
- BusTurnAroundDuration = 0x0
- Capacitive load  $C_L = 30$  pF

In all timing tables, the  $T_{KERCK}$  is the  $f_{mc\_ker\_ck}$  clock period.

**Figure 27. Asynchronous non-multiplexed SRAM/PSRAM/NOR read waveforms**

**Synchronous waveforms and timings**

Figure 30 through Figure 33 represent synchronous waveforms and Table 83 through Table 86 provide the corresponding timings. The results shown in these tables are obtained with the following FMC configuration:

- BurstAccessMode = FMC\_BurstAccessMode\_Enable
- MemoryType = FMC\_MemoryType\_CRAM
- WriteBurst = FMC\_WriteBurst\_Enable
- CLKDivision = 1
- DataLatency = 1 for NOR Flash; DataLatency = 0 for PSRAM

In all the timing tables, the  $T_{fmc\_ker\_ck}$  is the  $f_{fmc\_ker\_ck}$  clock period, with the following FMC\_CLK maximum values:

- For  $2.7\text{ V} < V_{DD} < 3.6\text{ V}$ , FMC\_CLK = 125 MHz at 20 pF
- For  $1.8\text{ V} < V_{DD} < 1.9\text{ V}$ , FMC\_CLK = 100 MHz at 20 pF
- For  $1.62\text{ V} < V_{DD} < 1.8\text{ V}$ , FMC\_CLK = 100 MHz at 15 pF

**NAND controller waveforms and timings**

Figure 34 through Figure 37 represent synchronous waveforms, and Table 87 and Table 88 provide the corresponding timings. The results shown in this table are obtained with the following FMC configuration:

- COM.FMC\_SetupTime = 0x01
- COM.FMC\_WaitSetupTime = 0x03
- COM.FMC\_HoldSetupTime = 0x02
- COM.FMC\_HiZSetupTime = 0x01
- ATT.FMC\_SetupTime = 0x01
- ATT.FMC\_WaitSetupTime = 0x03
- ATT.FMC\_HoldSetupTime = 0x02
- ATT.FMC\_HiZSetupTime = 0x01
- Bank = FMC\_Bank\_NAND
- MemoryDataWidth = FMC\_MemoryDataWidth\_16b
- ECC = FMC\_ECC\_Enable
- ECCPageSize = FMC\_ECCPageSize\_512Bytes
- TCLRSetupTime = 0
- TARSetupTime = 0
- Capacitive load  $C_L = 30$  pF

In all timing tables, the  $T_{fmc\_ker\_ck}$  is the `fmc_ker_ck` clock period.

**SDRAM waveforms and timings**

In all timing tables, the TKERCK is the fmc\_ker\_ck clock period, with the following FMC\_SDCLK maximum values:

- For  $2.7\text{ V} < V_{DD} < 3.6\text{ V}$ : FMC\_CLK = 110 MHz at 20 pF
- For  $1.8\text{ V} < V_{DD} < 1.9\text{ V}$ : FMC\_CLK = 100 MHz at 20 pF
- For  $1.62\text{ V} < V_{DD} < 1.8\text{ V}$ , FMC\_CLK = 100 MHz at 15 pF

### 6.3.19 Quad-SPI interface characteristics

Unless otherwise specified, the parameters given in [Table 93](#) and [Table 94](#) for QUADSPI are derived from tests performed under the ambient temperature,  $f_{\text{AHB}}$  frequency and  $V_{\text{DD}}$  supply voltage conditions summarized in [Table 23: General operating conditions](#), with the following configuration:

- Output speed is set to  $\text{OSPEEDRy}[1:0] = 11$
- Measurement points are done at CMOS levels:  $0.5V_{\text{DD}}$
- IO Compensation cell activated.
- HSLV activated when  $V_{\text{DD}} \leq 2.7 \text{ V}$
- VOS level set to VOS1

Refer to [Section 6.3.16: I/O port characteristics](#) for more details on the input/output alternate function characteristics.

The following table summarizes the parameters measured in SDR mode.

**Table 93. QUADSPI characteristics in SDR mode<sup>(1)</sup>**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$F_{\text{ck1}}/T_{\text{CK}}$	QUADSPI clock frequency	$2.7 < V_{\text{DD}} < 3.6 \text{ V}$ CL = 20 pF	-	-	133	MHz

1. Guaranteed by design.
2. The voltage booster on ADC switches must be used for V<sub>DDA</sub> < 2.4 V (embedded I/O switches).
3. These values are valid for UFBGA176+25 and one ADC. The values for other packages and multiple ADCs may be different.
4. Depending on the package, V<sub>REF+</sub> can be internally connected to V<sub>DDA</sub> and V<sub>REF-</sub> to V<sub>SSA</sub>.
5. The tolerance is 10 LSBs for 16-bit resolution, 4 LSBs for 14-bit resolution, and 2 LSBs for 12-bit, 10-bit and 8-bit resolutions.

Table 97. Minimum sampling time vs  $R_{AIN}^{(1)(2)}$

1. Guaranteed by design.
2. Data valid at up to 140 °C, with a 47 pF PCB capacitor, and  $V_{DDA}=1.6$  V.
3. Direct channels are connected to analog I/Os (PA0\_C, PA1\_C, PC2\_C and PC3\_C) to optimize ADC performance.
4. Fast channels correspond to PF3, PF5, PF7, PF9, PA6, PC4, PB1, PF11 and PF13.
5. Slow channels correspond to all ADC inputs except for the Direct and Fast channels.

Table 98. ADC accuracy<sup>(1)(2)</sup>

		Differential		-	81.2	-	
SNR	Signal-to-noise ratio	Single ended		-	77.0	-	
		Differential		-	81.0	-	
THD	Total harmonic distortion	Single ended		-	87	-	
		Differential		-	90	-	

1. Data guaranteed by characterization for BGA packages. The values for LQFP packages might differ.
2. ADC DC accuracy values are measured after internal calibration.
3. ADC clock frequency = 25 MHz, ADC resolution = 16 bits,  $V_{DDA}=V_{REF+}=3.3\text{ V}$  and BOOST=11.

Note: ADC accuracy vs. negative injection current: injecting a negative current on any analog input pins should be avoided as this significantly reduces the accuracy of the conversion being performed on another analog input. It is recommended to add a Schottky diode (pin to ground) to analog pins which may potentially inject negative currents.

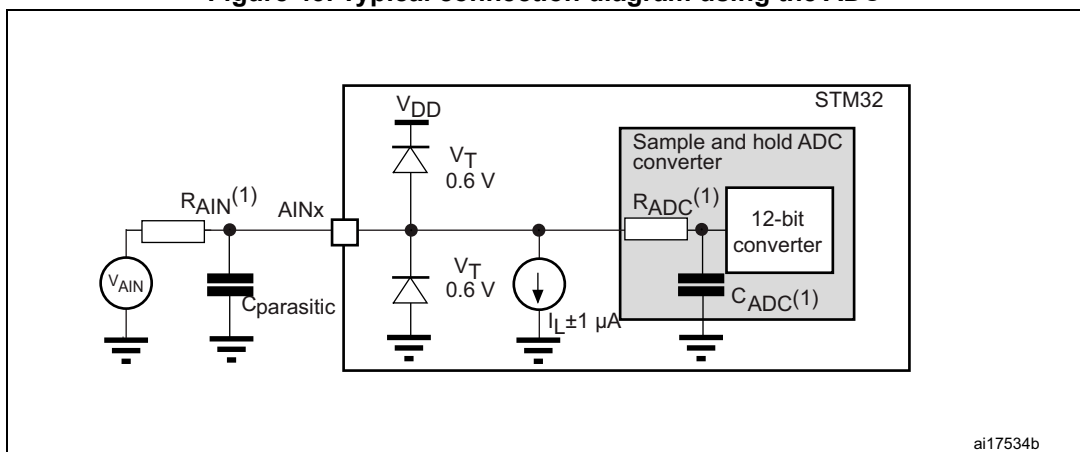

Any positive injection current within the limits specified for  $I_{INJ(PIN)}$  and  $\Sigma I_{INJ(PIN)}$  in [Section 6.3.15](#) does not affect the ADC accuracy.

Figure 42. ADC accuracy characteristics (12-bit resolution)

1. Example of an actual transfer curve.
2. Ideal transfer curve.
3. End point correlation line.
4.  $E_T$  = Total Unadjusted Error: maximum deviation between the actual and the ideal transfer curves.  
 $E_O$  = Offset Error: deviation between the first actual transition and the first ideal one.  
 $E_G$  = Gain Error: deviation between the last ideal transition and the last actual one.  
 $E_D$  = Differential Linearity Error: maximum deviation between actual steps and the ideal one.  
 $E_L$  = Integral Linearity Error: maximum deviation between any actual transition and the end point correlation line.

Figure 43. Typical connection diagram using the ADC

1. Refer to [Table 96](#) for the values of  $R_{AIN}$ ,  $R_{ADC}$  and  $C_{ADC}$ .
2.  $C_{parasitic}$  represents the capacitance of the PCB (dependent on soldering and PCB layout quality) plus the pad capacitance (roughly 5 pF). A high  $C_{parasitic}$  value downgrades conversion accuracy. To remedy this,  $f_{ADC}$  should be reduced.

**General PCB design guidelines**

Power supply decoupling should be performed as shown in [Figure 44](#) or [Figure 45](#), depending on whether  $V_{REF+}$  is connected to  $V_{DDA}$  or not. The 100 nF capacitors should be ceramic (good quality). They should be placed as close as possible to the chip.

**Figure 44. Power supply and reference decoupling ( $V_{REF+}$  not connected to  $V_{DDA}$ )**

1.  $V_{REF+}$  input is available on all package whereas the  $V_{REF-}$  is available only on UFBGA176+25 and TFBGA240+25. When  $V_{REF-}$  is not available, it is internally connected to  $V_{DDA}$  and  $V_{SSA}$ .

**Figure 45. Power supply and reference decoupling ( $V_{REF+}$  connected to  $V_{DDA}$ )**

1.  $V_{REF+}$  input is available on all package whereas the  $V_{REF-}$  is available only on UFBGA176+25 and TFBGA240+25. When  $V_{REF-}$  is not available, it is internally connected to  $V_{DDA}$  and  $V_{SSA}$ .

			No load, worst code (0xF1C)	-	490	-	
		DAC output buffer OFF	No load, middle/worst code (0x800)	-	20	-	
		Sample and Hold mode, C <sub>SH</sub> =100 nF	-	360*T <sub>ON</sub> / (T <sub>ON</sub> +T <sub>OFF</sub> ) <sup>(4)</sup>	-		
I <sub>DDV(DAC)</sub>	DAC consumption from V <sub>REF+</sub>	DAC output buffer ON	No load, middle code (0x800)	-	170	-	µA
			No load, worst code (0xF1C)	-	170	-	
		DAC output buffer OFF	No load, middle/worst code (0x800)	-	160	-	
		Sample and Hold mode, Buffer ON, C <sub>SH</sub> =100 nF (worst code)	-	170*T <sub>ON</sub> / (T <sub>ON</sub> +T <sub>OFF</sub> ) <sup>(4)</sup>	-		
		Sample and Hold mode, Buffer OFF, C <sub>SH</sub> =100 nF (worst code)	-	160*T <sub>ON</sub> / (T <sub>ON</sub> +T <sub>OFF</sub> ) <sup>(4)</sup>	-		

1. Guaranteed by design unless otherwise specified.

2. TBD stands for "to be defined".
3. In buffered mode, the output can overshoot above the final value for low input code (starting from the minimum value).
4.  $T_{ON}$  is the refresh phase duration, while  $T_{OFF}$  is the hold phase duration. Refer to the product reference manual for more details.

**Table 100. DAC accuracy<sup>(1)</sup>**

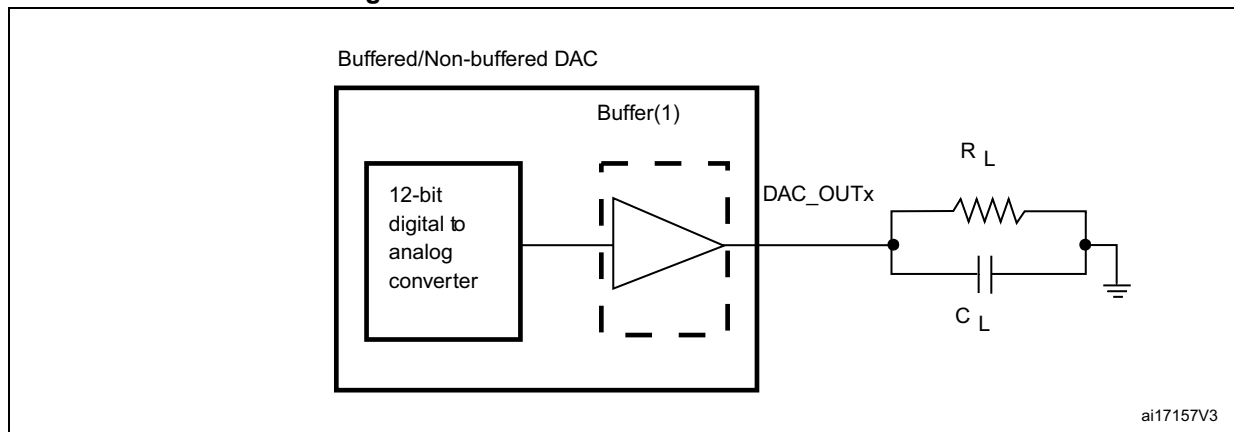

Symbol	Parameter	Conditions	Min	Typ	Max	Unit	
DNL	Differential non linearity <sup>(2)</sup>	DAC output buffer ON	-2	-	2	LSB	
		DAC output buffer OFF	-2	-	2		
-	Monotonicity	10 bits	-	-	-	-	
INL	Integral non linearity <sup>(3)</sup>	DAC output buffer ON, $C_L \leq 50$ pF, $R_L \geq 5$ k $\Omega$	-4	-	4	LSB	
		DAC output buffer OFF, $C_L \leq 50$ pF, no $R_L$	-4	-	4		
Offset	Offset error at code 0x800 <sup>(3)</sup>	DAC output buffer ON, $C_L \leq 50$ pF, $R_L \geq 5$ k $\Omega$	$V_{REF+} = 3.6$ V	-	-	$\pm 15$	LSB
			$V_{REF+} = 1.8$ V	-	-	$\pm 30$	
		DAC output buffer OFF, $C_L \leq 50$ pF, no $R_L$	-	-	$\pm 8$		
Offset1	Offset error at code 0x001 <sup>(4)</sup>	DAC output buffer OFF, $C_L \leq 50$ pF, no $R_L$	-	-	$\pm 5$	LSB	
OffsetCal	Offset error at code 0x800 after factory calibration	DAC output buffer ON, $C_L \leq 50$ pF, $R_L \geq 5$ k $\Omega$	$V_{REF+} = 3.6$ V	-	-	$\pm 6$	LSB
			$V_{REF+} = 1.8$ V	-	-	$\pm 7$	
Gain	Gain error <sup>(5)</sup>	DAC output buffer ON, $C_L \leq 50$ pF, $R_L \geq 5$ k $\Omega$	-	-	$\pm 1$	%	
		DAC output buffer OFF, $C_L \leq 50$ pF, no $R_L$	-	-	$\pm 1$		
SNR	Signal-to-noise ratio <sup>(6)</sup>	DAC output buffer ON, $C_L \leq 50$ pF, $R_L \geq 5$ k $\Omega$ , 1 kHz, BW = 500 KHz	-	67.8	-	dB	
		DAC output buffer OFF, $C_L \leq 50$ pF, no $R_L$ , 1 kHz, BW = 500 KHz	-	67.8	-		
THD	Total harmonic distortion <sup>(6)</sup>	DAC output buffer ON, $C_L \leq 50$ pF, $R_L \geq 5$ k $\Omega$ , 1 kHz	-	-78.6	-	dB	
		DAC output buffer OFF, $C_L \leq 50$ pF, no $R_L$ , 1 kHz	-	-78.6	-		
SINAD	Signal-to-noise and distortion ratio <sup>(6)</sup>	DAC output buffer ON, $C_L \leq 50$ pF, $R_L \geq 5$ k $\Omega$ , 1 kHz	-	67.5	-	dB	
		DAC output buffer OFF, $C_L \leq 50$ pF, no $R_L$ , 1 kHz	-	67.5	-		

Table 100. DAC accuracy<sup>(1)</sup> (continued)

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
ENOB	Effective number of bits	DAC output buffer ON, $C_L \leq 50 \text{ pF}$ , $R_L \geq 5 \text{ k}\Omega$ , 1 kHz	-	10.9	-	bits
		DAC output buffer OFF, $C_L \leq 50 \text{ pF}$ , no $R_L$ , 1 kHz	-	10.9	-	

1. Guaranteed by characterization.
2. Difference between two consecutive codes minus 1 LSB.
3. Difference between the value measured at Code *i* and the value measured at Code *i* on a line drawn between Code 0 and last Code 4095.
4. Difference between the value measured at Code (0x001) and the ideal value.
5. Difference between the ideal slope of the transfer function and the measured slope computed from code 0x000 and 0xFFFF when the buffer is OFF, and from code giving 0.2 V and ( $V_{REF+} - 0.2 \text{ V}$ ) when the buffer is ON.
6. Signal is -0.5dBFS with  $F_{\text{sampling}}=1 \text{ MHz}$ .

Figure 46. 12-bit buffered /non-buffered DAC

1. The DAC integrates an output buffer that can be used to reduce the output impedance and to drive external loads directly without the use of an external operational amplifier. The buffer can be bypassed by configuring the BOFFx bit in the DAC\_CR register.

## 6.3.23 Voltage reference buffer characteristics

Table 101. VREFBUF characteristics<sup>(1)</sup>

Symbol	Parameter	Conditions		Min	Typ	Max	Unit
V <sub>DDA</sub>	Analog supply voltage	Normal mode	VSCALE = 000	2.8	3.3	3.6	V
			VSCALE = 001	2.4	-	3.6	
			VSCALE = 010	2.1	-	3.6	
			VSCALE = 011	1.8	-	3.6	
		Degraded mode	VSCALE = 000	1.62	-	2.80	
			VSCALE = 001	1.62	-	2.40	
			VSCALE = 010	1.62	-	2.10	
			VSCALE = 011	1.62	-	1.80	
V <sub>REFBUF_OUT</sub>	Voltage Reference Buffer Output, at 30 °C, I <sub>load</sub> = 100 μA	Normal mode	VSCALE = 000	2.498	2.5	2.5035	V
			VSCALE = 001	2.046	2.049	2.052	
			VSCALE = 010	1.801	1.804	1.806	
			VSCALE = 011	1.4995	1.5015	1.504	
		Degraded mode <sup>(2)</sup>	VSCALE = 000	V <sub>DDA</sub> - 150 mV	-	V <sub>DDA</sub>	
			VSCALE = 001	V <sub>DDA</sub> - 150 mV	-	V <sub>DDA</sub>	
			VSCALE = 010	V <sub>DDA</sub> - 150 mV	-	V <sub>DDA</sub>	
			VSCALE = 011	V <sub>DDA</sub> - 150 mV	-	V <sub>DDA</sub>	
TRIM	Trim step resolution	-	-	-	±0.05	±0.1	%
C <sub>L</sub>	Load capacitor	-	-	0.5	1	1.50	μF
esr	Equivalent Serial Resistor of C <sub>L</sub>	-	-	-	-	2	Ω
I <sub>load</sub>	Static load current	-	-	-	-	4	mA
I <sub>line_reg</sub>	Line regulation	2.8 V ≤ V <sub>DDA</sub> ≤ 3.6 V	I <sub>load</sub> = 500 μA	-	200	-	ppm/V
			I <sub>load</sub> = 4 mA	-	100	-	
I <sub>load_reg</sub>	Load regulation	500 μA ≤ I <sub>LOAD</sub> ≤ 4 mA	Normal Mode	-	50	-	ppm/mA
T <sub>coeff</sub>	Temperature coefficient	-40 °C < T <sub>J</sub> < +125 °C		-	-	T <sub>coeff</sub> V <sub>REFINT</sub> + 100	ppm/°C
PSRR	Power supply rejection	DC	-	-	60	-	dB
		100KHz	-	-	40	-	

**Table 101. VREFBUF characteristics<sup>(1)</sup> (continued)**

Symbol	Parameter	Conditions		Min	Typ	Max	Unit
t <sub>START</sub>	Start-up time	C <sub>L</sub> =0.5 μF	-	-	300	-	μs
		C <sub>L</sub> =1 μF	-	-	500	-	
		C <sub>L</sub> =1.5 μF	-	-	650	-	
I <sub>INRUSH</sub>	Control of maximum DC current drive on V <sub>REFBUF_OUT</sub> during startup phase <sup>(3)</sup>	-		-	8	-	mA
I <sub>DDA(VREFBUF)</sub>	VREFBUF consumption from V <sub>DDA</sub>	I <sub>LOAD</sub> = 0 μA	-	-	15	25	μA
		I <sub>LOAD</sub> = 500 μA	-	-	16	30	
		I <sub>LOAD</sub> = 4 mA	-	-	32	50	

1. Guaranteed by design.
2. In degraded mode, the voltage reference buffer cannot accurately maintain the output voltage (V<sub>DDA</sub>-drop voltage).
3. To properly control VREFBUF I<sub>INRUSH</sub> current during the startup phase and the change of scaling, V<sub>DDA</sub> voltage should be in the range of 1.8 V-3.6 V, 2.1 V-3.6 V, 2.4 V-3.6 V and 2.8 V-3.6 V for VSCALE = 011, 010, 001 and 000, respectively.

### 6.3.24 Temperature sensor characteristics

**Table 102. Temperature sensor characteristics**

Symbol	Parameter	Min	Typ	Max	Unit
T <sub>L</sub> <sup>(1)</sup>	V <sub>SENSE</sub> linearity with temperature	-	-	3	°C
Avg_Slope <sup>(2)</sup>	Average slope	-	2	-	mV/°C
V <sub>30</sub> <sup>(3)</sup>	Voltage at 30°C ± 5 °C	-	0.62	-	V
t <sub>start_run</sub>	Startup time in Run mode (buffer startup)	-	-	25.2	μs
t <sub>S_temp</sub> <sup>(1)</sup>	ADC sampling time when reading the temperature	9	-	-	
I <sub>sens</sub> <sup>(1)</sup>	Sensor consumption	-	0.18	0.31	μA
I <sub>sensbuf</sub> <sup>(1)</sup>	Sensor buffer consumption	-	3.8	6.5	

1. Guaranteed by design.
2. Guaranteed by characterization.
3. Measured at V<sub>DDA</sub> = 3.3 V ± 10 mV. The V<sub>30</sub> ADC conversion result is stored in the TS\_CAL1 byte.

**Table 103. Temperature sensor calibration values**

Symbol	Parameter	Memory address
TS_CAL1	Temperature sensor raw data acquired value at 30 °C, V <sub>DDA</sub> =3.3 V	0x1FF1 E820 - 0x1FF1 E821
TS_CAL2	Temperature sensor raw data acquired value at 110 °C, V <sub>DDA</sub> =3.3 V	0x1FF1 E840 - 0x1FF1 E841

6.3.25 Temperature and V<sub>BAT</sub> monitoring

Table 104. V<sub>BAT</sub> monitoring characteristics

Symbol	Parameter	Min	Typ	Max	Unit
R	Resistor bridge for V <sub>BAT</sub>	-	26	-	KΩ
Q	Ratio on V <sub>BAT</sub> measurement	-	4	-	-
Er <sup>(1)</sup>	Error on Q	-10	-	+10	%
t <sub>S_vbat</sub> <sup>(1)</sup>	ADC sampling time when reading V <sub>BAT</sub> input	9	-	-	μs
V <sub>BAThigh</sub>	High supply monitoring	-	3.55	-	V
V <sub>BATlow</sub>	Low supply monitoring	-	1.36	-	

1. Guaranteed by design.

Table 105. V<sub>BAT</sub> charging characteristics

Symbol	Parameter	Condition	Min	Typ	Max	Unit
R <sub>BC</sub>	Battery charging resistor	VBRS in PWR_CR3= 0	-	5	-	KΩ
		VBRS in PWR_CR3= 1		1.5	-	

Table 106. Temperature monitoring characteristics

Symbol	Parameter	Min	Typ	Max	Unit
TEMP <sub>high</sub>	High temperature monitoring	-	117	-	°C
TEMP <sub>low</sub>	Low temperature monitoring	-	-25	-	

6.3.26 Voltage booster for analog switch

Table 107. Voltage booster for analog switch characteristics<sup>(1)</sup>

Symbol	Parameter	Condition	Min	Typ	Max	Unit
V <sub>DD</sub>	Supply voltage	-	1.62	2.6	3.6	V
t <sub>SU(BOOST)</sub>	Booster startup time	-	-	-	50	μs
I <sub>DD(BOOST)</sub>	Booster consumption	1.62 V ≤ V <sub>DD</sub> ≤ 2.7 V	-	-	125	μA
		2.7 V < V <sub>DD</sub> < 3.6 V	-	-	250	

1. Guaranteed by characterization results.

6.3.27 Comparator characteristics

Table 108. COMP characteristics<sup>(1)</sup>

Symbol	Parameter	Conditions	Min	Typ	Max	Unit	
V <sub>DDA</sub>	Analog supply voltage	-	1.62	3.3	3.6	V	
V <sub>IN</sub>	Comparator input voltage range	-	0	-	V <sub>DDA</sub>		
V <sub>BG</sub>	Scaler input voltage	-	(2)				
V <sub>SC</sub>	Scaler offset voltage	-	-	±5	±10	mV	
I <sub>DDA(SCALER)</sub>	Scaler static consumption from V <sub>DDA</sub>	BRG_EN=0 (bridge disable)	-	0.2	0.3	µA	
		BRG_EN=1 (bridge enable)	-	0.8	1		
t <sub>START_SCALER</sub>	Scaler startup time	-	-	140	250	µs	
t <sub>START</sub>	Comparator startup time to reach propagation delay specification	High-speed mode	-	2	5	µs	
		Medium mode	-	5	20		
		Ultra-low-power mode	-	15	80		
t <sub>D</sub> <sup>(3)</sup>	Propagation delay for 200 mV step with 100 mV overdrive	High-speed mode	-	50	80	ns	
		Medium mode	-	0.5	1.2	µs	
		Ultra-low-power mode	-	2.5	7		
	Propagation delay for step > 200 mV with 100 mV overdrive only on positive inputs	High-speed mode	-	50	120	ns	
		Medium mode	-	0.5	1.2	µs	
		Ultra-low-power mode	-	2.5	7		
V <sub>offset</sub>	Comparator offset error	Full common mode range	-	±5	±20	mV	
V <sub>hys</sub>	Comparator hysteresis	No hysteresis	-	0	-	mV	
		Low hysteresis	5	10	22		
		Medium hysteresis	8	20	37		
		High hysteresis	16	30	52		
I <sub>DDA(COMP)</sub>	Comparator consumption from V <sub>DDA</sub>	Ultra-low-power mode	Static	-	400	600	nA
			With 50 kHz ±100 mV overdrive square signal	-	800	-	
		Medium mode	Static	-	5	7	µA
			With 50 kHz ±100 mV overdrive square signal	-	6	-	
		High-speed mode	Static	-	70	100	
			With 50 kHz ±100 mV overdrive square signal	-	75	-	

1. Guaranteed by design, unless otherwise specified.
2. Refer to [Table 30: Embedded reference voltage](#).

3. Guaranteed by characterization results.

### 6.3.28 Operational amplifier characteristics

Table 109. Operational amplifier characteristics

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$V_{DDA}$	Analog supply voltage Range	-	2	3.3	3.6	V
CMIR	Common Mode Input Range	-	0	-	$V_{DDA}$	
$V_{I\text{OFFSET}}$	Input offset voltage	25°C, no load on output	-	-	±1.5	mV
		All voltages and temperature, no load	-	-	±2.5	
$\Delta V_{I\text{OFFSET}}$	Input offset voltage drift	-	-	±3.0	-	µV/°C
TRIMOFFSETP TRIMLPOFFSETP	Offset trim step at low common input voltage (0.1* $V_{DDA}$ )	-	-	1.1	1.5	mV
TRIMOFFSETN TRIMLPOFFSETN	Offset trim step at high common input voltage (0.9* $V_{DDA}$ )	-	-	1.1	1.5	
$I_{LOAD}$	Drive current	-	-	-	500	µA
$I_{LOAD\_PGA}$	Drive current in PGA mode	-	-	-	270	
$C_{LOAD}$	Capacitive load	-	-	-	50	pF
CMRR	Common mode rejection ratio	-	-	80	-	dB
PSRR	Power supply rejection ratio	$C_{LOAD} \leq 50\text{pf} /$ $R_{LOAD} \geq 4\text{ k}\Omega^{(1)}$ at 1 kHz, $V_{com} = V_{DDA}/2$	50	66	-	dB
GBW	Gain bandwidth for high supply range	200 mV ≤ Output dynamic range ≤ $V_{DDA} - 200\text{ mV}$	4	7.3	12.3	MHz
SR	Slew rate (from 10% and 90% of output voltage)	Normal mode	-	3	-	V/µs
		High-speed mode	-	30	-	
AO	Open loop gain	200 mV ≤ Output dynamic range ≤ $V_{DDA} - 200\text{ mV}$	59	90	129	dB
$\phi_m$	Phase margin	-	-	55	-	°
GM	Gain margin	-	-	12	-	dB
$V_{OHSAT}$	High saturation voltage	$I_{load} = \text{max}$ or $R_{LOAD} = \text{min}$ , Input at $V_{DDA}$	$V_{DDA} - 100\text{ mV}$	-	-	mV
$V_{OLSAT}$	Low saturation voltage	$I_{load} = \text{max}$ or $R_{LOAD} = \text{min}$ , Input at 0 V	-	-	100	

Table 109. Operational amplifier characteristics (continued)

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
t <sub>WAKEUP</sub>	Wake up time from OFF state	Normal mode C <sub>LOAD</sub> ≤ 50pf, R <sub>LOAD</sub> ≥ 4 kΩ, follower configuration	-	0.8	3.2	μs
		High speed mode C <sub>LOAD</sub> ≤ 50pf, R <sub>LOAD</sub> ≥ 4 kΩ, follower configuration	-	0.9	2.8	
PGA gain	Non inverting gain error value	PGA gain = 2	-1	-	1	%
		PGA gain = 4	-2	-	2	
		PGA gain = 8	-2.5	-	2.5	
		PGA gain = 16	-3	-	3	
	Inverting gain error value	PGA gain = 2	-1	-	1	
		PGA gain = 4	-1	-	1	
		PGA gain = 8	-2	-	2	
		PGA gain = 16	-3	-	3	
	External non-inverting gain error value	PGA gain = 2	-1	-	1	
		PGA gain = 4	-3	-	3	
		PGA gain = 8	-3.5	-	3.5	
		PGA gain = 16	-4	-	4	
R <sub>network</sub>	R2/R1 internal resistance values in non-inverting PGA mode <sup>(2)</sup>	PGA Gain=2	-	10/10	-	kΩ/ kΩ
		PGA Gain=4	-	30/10	-	
		PGA Gain=8	-	70/10	-	
		PGA Gain=16	-	150/10	-	
	R2/R1 internal resistance values in inverting PGA mode <sup>(2)</sup>	PGA Gain = -1	-	10/10	-	
		PGA Gain = -3	-	30/10	-	
		PGA Gain = -7	-	70/10	-	
		PGA Gain = -15	-	150/10	-	
Delta R	Resistance variation (R1 or R2)	-	-15	-	15	%

**Table 109. Operational amplifier characteristics (continued)**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit	
PGA BW	PGA bandwidth for different non inverting gain	Gain=2	-	GBW/2	-	MHz	
		Gain=4	-	GBW/4	-		
		Gain=8	-	GBW/8	-		
		Gain=16	-	GBW/16	-		
	PGA bandwidth for different inverting gain	Gain = -1	-	5.00	-	MHz	
		Gain = -3	-	3.00	-		
		Gain = -7	-	1.50	-		
		Gain = -15	-	0.80	-		
en	Voltage noise density	at 1 KHz	output loaded with 4 kΩ	-	140	-	nV/√Hz
		at 10 KHz		-	55	-	
I <sub>DDA(OPAMP)</sub>	OPAMP consumption from V <sub>DDA</sub>	Normal mode	no Load, quiescent mode, follower	-	570	1000	μA
		High-speed mode		-	610	1200	

- R<sub>LOAD</sub> is the resistive load connected to VSSA or to VDDA.
- R2 is the internal resistance between the OPAMP output and th OPAMP inverting input. R1 is the internal resistance between the OPAMP inverting input and ground. PGA gain = 1 + R2/R1.

### 6.3.29 Digital filter for Sigma-Delta Modulators (DFSDM) characteristics

Unless otherwise specified, the parameters given in [Table 110](#) for DFSDM are derived from tests performed under the ambient temperature, fPCLKx frequency and supply voltage conditions summarized in [Table 23: General operating conditions](#).

- Output speed is set to OSPEEDRy[1:0] = 10
- Capacitive load C<sub>L</sub> = 30 pF
- Measurement points are done at CMOS levels: 0.5V<sub>DD</sub>
- VOS level set to VOS1

Refer to [Section 6.3.16: I/O port characteristics](#) for more details on the input/output alternate function characteristics (DiFSDM\_CKINx, DFSDM\_DATINx, DFSDM\_CKOUT for DFSDM).

Table 110. DFSDM measured timing 1.62-3.6 V

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$f_{DFSDMCLK}$	DFSDM clock	$1.62 < V_{DD} < 3.6 \text{ V}$	-	-	133	MHz
$f_{CKIN}$ ( $1/T_{CKIN}$ )	Input clock frequency	SPI mode (SITP[1:0]=0,1), External clock mode (SPICKSEL[1:0]=0), $1.62 < V_{DD} < 3.6 \text{ V}$	-	-	20	
		SPI mode (SITP[1:0]=0,1), External clock mode (SPICKSEL[1:0]=0), $2.7 < V_{DD} < 3.6 \text{ V}$	-	-	20	
		SPI mode (SITP[1:0]=0,1), Internal clock mode (SPICKSEL[1:0]'0), $1.62 < V_{DD} < 3.6 \text{ V}$	-	-	20	
		SPI mode (SITP[1:0]=0,1), Internal clock mode (SPICKSEL[1:0]'0), $2.7 < V_{DD} < 3.6 \text{ V}$	-	-	20	
$f_{CKOUT}$	Output clock frequency	$1.62 < V_{DD} < 3.6 \text{ V}$	-	-	20	
$DuCy_{CKOUT}$ T	Output clock frequency duty cycle	$1.62 < V_{DD} < 3.6 \text{ V}$	45	50	55	%
$t_{wh(CKIN)}$ $t_{wl(CKIN)}$	Input clock high and low time	SPI mode (SITP[1:0]=0,1), External clock mode (SPICKSEL[1:0]=0), $1.62 < V_{DD} < 3.6 \text{ V}$	$T_{CKIN}/2-0.5$	$T_{CKIN}/2$	-	ns
$t_{su}$	Data input setup time	SPI mode (SITP[1:0]=0,1), External clock mode (SPICKSEL[1:0]=0), $1.62 < V_{DD} < 3.6 \text{ V}$	1.5	-	-	
$t_h$	Data input hold time	SPI mode (SITP[1:0]=0,1), External clock mode (SPICKSEL[1:0]=0), $1.62 < V_{DD} < 3.6 \text{ V}$	0.5	-	-	
$T_{Manchester}$	Manchester data period (recovered clock period)	Manchester mode (SITP[1:0]=2,3), Internal clock mode (SPICKSEL[1:0]'0), $1.62 < V_{DD} < 3.6 \text{ V}$	$(CKOUTDIV+1) * T_{DFSDMCLK}$	-	$(2*CKOUTDIV) * T_{DFSDMCLK}$	

Figure 47. Channel transceiver timing diagrams

### 6.3.30 Camera interface (DCMI) timing specifications

Unless otherwise specified, the parameters given in [Table 111](#) for DCMI are derived from tests performed under the ambient temperature,  $f_{HCLK}$  frequency and VDD supply voltage summarized in [Table 23: General operating conditions](#), with the following configuration:

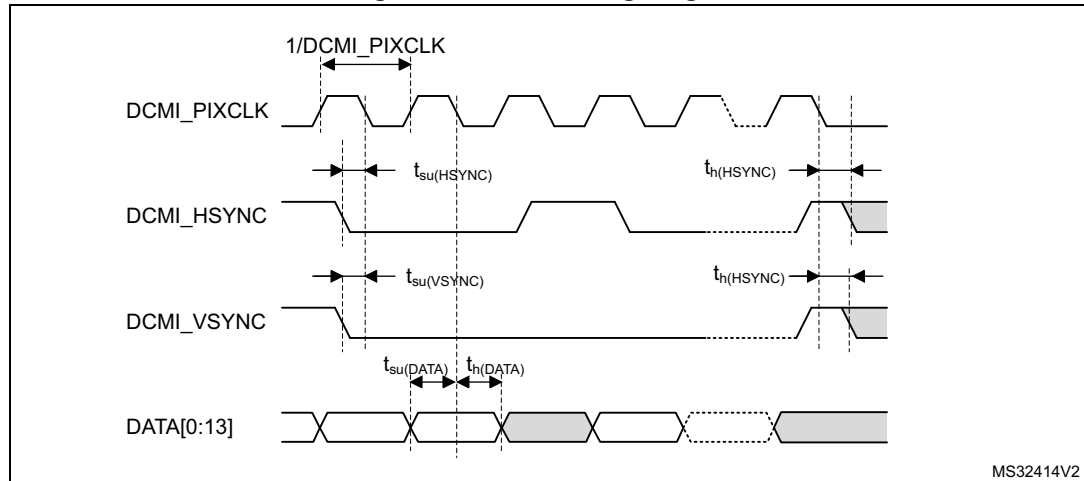

- DCMI\_PIXCLK polarity: falling
- DCMI\_VSYNC and DCMI\_HSYNC polarity: high
- Data formats: 14 bits
- Capacitive load  $C_L=30$  pF
- Measurement points are done at CMOS levels:  $0.5V_{DD}$
- VOS level set to VOS1

**Table 111. DCMI characteristics<sup>(1)</sup>**

Symbol	Parameter	Min	Max	Unit
-	Frequency ratio DCMI_PIXCLK/ $f_{HCLK}$	-	0.4	-
DCMI_PIXCLK	Pixel Clock input	-	80	MHz
$D_{pixel}$	Pixel Clock input duty cycle	30	70	%
$t_{su}(DATA)$	Data input setup time	3	-	-
$t_h(DATA)$	Data hold time	1	-	-
$t_{su}(HSYNC)$ , $t_{su}(VSYNC)$	DCMI_HSYNC/ DCMI_VSYNC input setup time	2	-	ns
$t_h(HSYNC)$ , $t_h(VSYNC)$	DCMI_HSYNC/ DCMI_VSYNC input hold time	1	-	-

1. Guaranteed by characterization results.

**Figure 48. DCMI timing diagram**

### 6.3.31 LCD-TFT controller (LTDC) characteristics

Unless otherwise specified, the parameters given in [Table 112](#) for LCD-TFT are derived from tests performed under the ambient temperature,  $f_{HCLK}$  frequency and VDD supply voltage summarized in [Table 23: General operating conditions](#), with the following configuration:

- LCD\_CLK polarity: high
- LCD\_DE polarity: low
- LCD\_VSYNC and LCD\_HSYNC polarity: high
- Pixel formats: 24 bits
- Output speed is set to OSPEEDRy[1:0] = 11
- Capacitive load  $C_L=30$  pF
- Measurement points are done at CMOS levels: 0.5VDD
- IO Compensation cell activated.
- HSLV activated when  $V_{DD} \leq 2.7$  V
- VOS level set to VOS1

**Table 112. LTDC characteristics<sup>(1)</sup>**

Symbol	Parameter		Min	Max	Unit
$f_{CLK}$	LTDC clock output frequency	$2.7 < V_{DD} < 3.6$ V 20pF	-	150	MHz
		$2.7 < V_{DD} < 3.6$ V		133	
		$1.62 < V_{DD} < 3.6$ V		90	
$D_{CLK}$	LTDC clock output duty cycle		45	55	%
$t_{w(CLKH)}$ , $t_{w(CLKL)}$	Clock High time, low time		$t_{w(CLK)}/2-0.5$	$t_{w(CLK)}/2+0.5$	-
$t_{v(DATA)}$	Data output valid time	$2.7 < V_{DD} < 3.6$ V	-	0.5	-
$t_{h(DATA)}$		$1.62 < V_{DD} < 3.6$ V		5	
$t_{v(DATA)}$	Data output hold time		0	-	-
$t_{v(HSYNC)}$ , $t_{v(VSYNC)}$ , $t_{v(DE)}$	HSYNC/VSYNC/DE output valid time	$2.7 < V_{DD} < 3.6$ V	-	0.5	-
		$1.62 < V_{DD} < 3.6$ V	-	5	-
$t_{h(HSYNC)}$ , $t_{h(VSYNC)}$ , $t_{h(DE)}$	HSYNC/VSYNC/DE output hold time		0	-	-

1. Guaranteed by characterization results.

### 6.3.32 Timer characteristics

The parameters given in [Table 113](#) are guaranteed by design.

Refer to [Section 6.3.16: I/O port characteristics](#) for details on the input/output alternate function characteristics (output compare, input capture, external clock, PWM output).

**Table 113. TIMx characteristics<sup>(1)(2)</sup>**

Symbol	Parameter	Conditions <sup>(3)</sup>	Min	Max	Unit
$t_{res(TIM)}$	Timer resolution time	AHB/APBx prescaler=1 or 2 or 4, $f_{TIMxCLK} = 240$ MHz	1	-	$t_{TIMxCLK}$
		AHB/APBx prescaler>4, $f_{TIMxCLK} = 120$ MHz	1	-	$t_{TIMxCLK}$
$f_{EXT}$	Timer external clock frequency on CH1 to CH4	$f_{TIMxCLK} = 240$ MHz	0	$f_{TIMxCLK}/2$	MHz
$Res_{TIM}$	Timer resolution		-	16/32	bit
$t_{MAX\_COUNT}$	Maximum possible count with 32-bit counter	-	-	$65536 \times 65536$	$t_{TIMxCLK}$

1. TIMx is used as a general term to refer to the TIM1 to TIM17 timers.
2. Guaranteed by design.
3. The maximum timer frequency on APB1 or APB2 is up to 240 MHz, by setting the TIMPRE bit in the RCC\_CFGR register, if APBx prescaler is 1 or 2 or 4, then  $TIMxCLK = rcc\_hclk1$ , otherwise  $TIMxCLK = 4 \times F_{rcc\_pclkx\_d2}$ .

### 6.3.33 Communication interfaces

#### I<sup>2</sup>C interface characteristics

The I<sup>2</sup>C interface meets the timings requirements of the I2C-bus specification and user manual revision 03 for:

- Standard-mode (Sm): with a bit rate up to 100 kbit/s
- Fast-mode (Fm): with a bit rate up to 400 kbit/s
- Fast-mode Plus (Fm+): with a bit rate up to 1 Mbit/s.

The I<sup>2</sup>C timings requirements are guaranteed by design when the I<sup>2</sup>C peripheral is properly configured (refer to RM0399 reference manual) and when the `i2c_ker_ck` frequency is greater than the minimum shown in the table below:

**Table 114. Minimum i2c\_ker\_ck frequency in all I<sup>2</sup>C modes**

Symbol	Parameter	Condition		Min	Unit
f(I2CCLK)	I2CCLK frequency	Standard-mode	-	2	MHz
		Fast-mode	Analog Filtre ON DNF=0	8	
			Analog Filtre OFF DNF=1	9	
		Fast-mode Plus	Analog Filtre ON DNF=0	17	
			Analog Filtre OFF DNF=1	16	-

The SDA and SCL I/O requirements are met with the following restrictions:

- The SDA and SCL I/O pins are not “true” open-drain. When configured as open-drain, the PMOS connected between the I/O pin and V<sub>DDIOx</sub> is disabled, but still present.
- The 20 mA output drive requirement in Fast-mode Plus is not supported. This limits the maximum load C<sub>Load</sub> supported in Fm+, which is given by these formulas:

$$t_{r(SDA/SCL)} = 0.8473 \times R_P \times C_{Load}$$

$$R_{P(min)} = (V_{DD} - V_{OL(max)}) / I_{OL(max)}$$

Where R<sub>P</sub> is the I2C lines pull-up. Refer to [Section 6.3.16: I/O port characteristics](#) for the I<sup>2</sup>C I/Os characteristics.

All I<sup>2</sup>C SDA and SCL I/Os embed an analog filter. Refer to the table below for the analog filter characteristics:

**Table 115. I<sup>2</sup>C analog filter characteristics<sup>(1)</sup>**

Symbol	Parameter	Min	Max	Unit
t <sub>AF</sub>	Maximum pulse width of spikes that are suppressed by analog filter	50 <sup>(2)</sup>	80 <sup>(3)</sup>	ns

1. Guaranteed by characterization results.
2. Spikes with widths below t<sub>AF(min)</sub> are filtered.
3. Spikes with widths above t<sub>AF(max)</sub> are not filtered.

**USART interface characteristics**

Unless otherwise specified, the parameters given in [Table 116](#) for USART are derived from tests performed under the ambient temperature, f<sub>PCLKx</sub> frequency and V<sub>DD</sub> supply voltage conditions summarized in [Table 23: General operating conditions](#), with the following configuration:

- Output speed is set to OSPEEDRy[1:0] = 10
- Capacitive load C<sub>L</sub> = 30 pF
- Measurement points are done at CMOS levels: 0.5V<sub>DD</sub>
- IO Compensation cell activated.
- VOS level set to VOS1

Refer to [Section 6.3.16: I/O port characteristics](#) for more details on the input/output alternate function characteristics (NSS, CK, TX, RX for USART).

**Table 116. USART characteristics<sup>(1)</sup>**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
f <sub>CK</sub>	USART clock frequency	Master mode	-	-	12.5	MHz
		Slave mode			25	
t <sub>su(NSS)</sub>	NSS setup time	Slave mode	t <sub>ker</sub> +1	-	-	-
t <sub>h(NSS)</sub>	NSS hold time	Slave mode	2	-	-	
t <sub>w(SCKH)</sub> , t <sub>w(SCKL)</sub>	CK high and low time	Master mode	1/f <sub>CK</sub> /2-2	1/f <sub>CK</sub> /2	1/f <sub>CK</sub> /2+2	
t <sub>su(RX)</sub>	Data input setup time	Master mode	t <sub>ker</sub> +6	-	-	ns
		Slave mode	1.5	-	-	
t <sub>h(RX)</sub>	Data input hold time	Master mode	0	-	-	
		Slave mode	1.5	-	-	
t <sub>v(TX)</sub>	Data output valid time	Slave mode	-	12	20	
		Master mode	-	0.5	1	
t <sub>h(TX)</sub>	Data output hold time	Slave mode	9	-	-	
		Master mode	0	-	-	

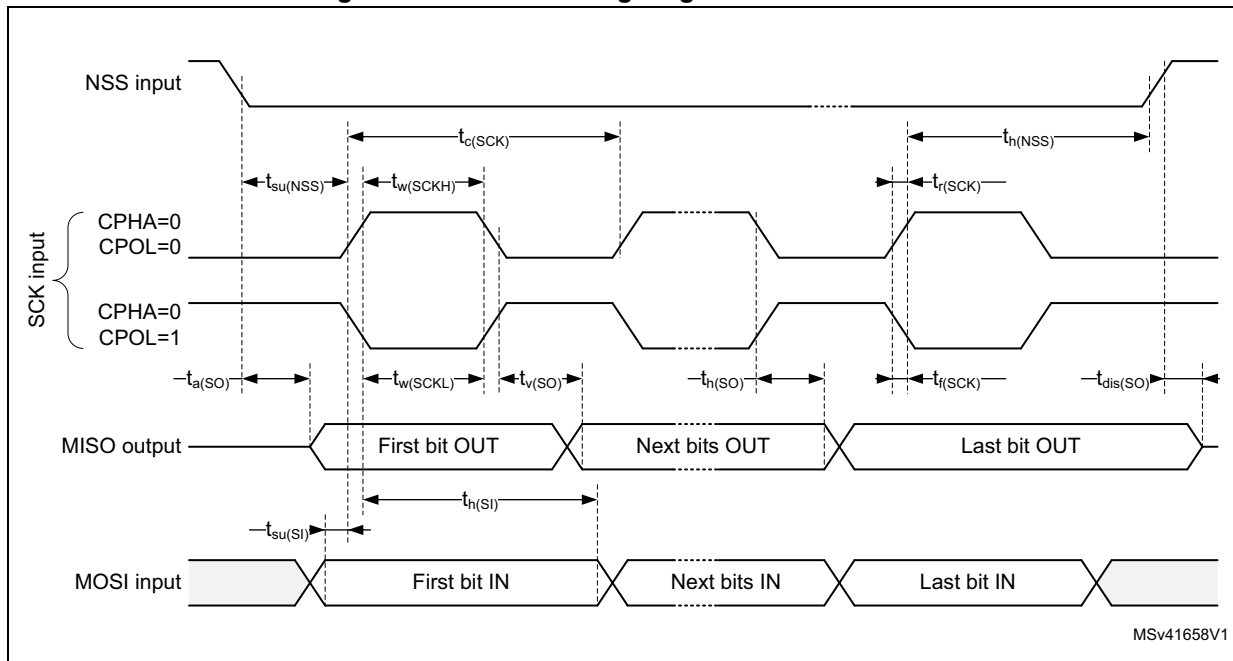

1. Guaranteed by characterization results.

1. Measurement points are done at  $0.5V_{DD}$  and with external  $C_L = 30\text{ pF}$ .

Figure 52. USART timing diagram in Slave mode

**SPI interface characteristics**

Unless otherwise specified, the parameters given in [Table 117](#) for SPI are derived from tests performed under the ambient temperature,  $f_{PCLKx}$  frequency and  $V_{DD}$  supply voltage conditions summarized in [Table 23: General operating conditions](#), with the following configuration:

- Output speed is set to  $OSPEEDRy[1:0] = 11$
- Capacitive load  $C_L = 30$  pF
- Measurement points are done at CMOS levels:  $0.5V_{DD}$
- IO Compensation cell activated.
- HSLV activated when  $V_{DD} \leq 2.7$  V
- VOS level set to VOS1

Refer to [Section 6.3.16: I/O port characteristics](#) for more details on the input/output alternate function characteristics (NSS, SCK, MOSI, MISO for SPI).

**Table 117. SPI characteristics<sup>(1)</sup>**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$f_{SCK}$	SPI clock frequency	Master mode $1.62 < V_{DD} < 3.6$ V SPI1, 2, 3	-	-	80	MHz
		Master mode $2.7 < V_{DD} < 3.6$ V SPI1, 2, 3			100	
		Master mode $1.62 < V_{DD} < 3.6$ V SPI4, 5, 6			50	
		Slave receiver mode $1.62 < V_{DD} < 3.6$ V			100

### I<sup>2</sup>S Interface characteristics

Unless otherwise specified, the parameters given in [Table 118](#) for I<sup>2</sup>S are derived from tests performed under the ambient temperature,  $f_{PCLKx}$  frequency and  $V_{DD}$  supply voltage conditions summarized in [Table 23: General operating conditions](#), with the following configuration:

- Output speed is set to OSPEEDRy[1:0] = 10
- Capacitive load  $C_L = 30$  pF
- Measurement points are done at CMOS levels:  $0.5V_{DD}$
- IO Compensation cell activated.
- HSLV activated when  $V_{DD} \leq 2.7$  V
- VOS level set to VOS1

Refer to [Section 6.3.16: I/O port characteristics](#) for more details on the input/output alternate function characteristics (CK,SD,WS).

**Table 118. I<sup>2</sup>S dynamic characteristics<sup>(1)</sup>**

Symbol	Parameter	Conditions	Min	Max	Unit
$f_{MCK}$	I <sup>2</sup> S main clock output	-	256x8K	$256F_S$	MHz
$f_{CK}$	I <sup>2</sup> S clock frequency	Master data	-	$64F_S$	MHz
		Slave data	-	$64F_S$	
$t_{v(WS)}$	WS valid time	Master mode	-	3	ns
$t_{h(WS)}$	WS hold time	Master mode	0	-	
$t_{su(WS)}$	WS setup time	Slave mode	1	-

### SAI characteristics

Unless otherwise specified, the parameters given in [Table 119](#) for SAI are derived from tests performed under the ambient temperature,  $f_{PCLKx}$  frequency and VDD supply voltage conditions summarized in [Table 23: General operating conditions](#), with the following configuration:

- Output speed is set to OSPEEDRy[1:0] = 10
- Capacitive load  $C_L = 30$  pF
- IO Compensation cell activated.
- Measurement points are done at CMOS levels: 0.5VDD
- VOS level set to VOS1.

Refer to [Section 6.3.16: I/O port characteristics](#) for more details on the input/output alternate function characteristics (SCK,SD,WS).

**Table 119. SAI characteristics<sup>(1)</sup>**

Symbol	Parameter	Conditions	Min	Max	Unit
$f_{MCK}$	SAI Main clock output	-	256x8K	$256 \times F_S$	MHz
$f_{CK}$	SAI clock frequency <sup>(2)</sup>	Master Data: 32 bits	-	$128 \times F_S^{(3)}$	
		Slave Data: 32 bits	-	$128 \times F_S^{(3)}$	

Table 119. SAI characteristics<sup>(1)</sup> (continued)

Symbol	Parameter	Conditions	Min	Max	Unit
$t_{v(FS)}$	$F_S$ valid time	Master mode $2.7 \leq V_{DD} \leq 3.6$	-	13	ns
		Master mode $1.62 \leq V_{DD} \leq 3.6$	-	20	
$t_{su(FS)}$	$F_S$ hold time	Master mode	8	-	
$t_{h(FS)}$	$F_S$ setup time	Slave mode	1	-	
	$F_S$ hold time	Slave mode	1	-	
$t_{su(SD\_A\_MR)}$	Data input setup time	Master receiver	0.5	-	
$t_{su(SD\_B\_SR)}$		Slave receiver	1	-	
$t_{h(SD\_A\_MR)}$	Data input hold time	Master receiver	3.5	-	
$t_{h(SD\_B\_SR)}$		Slave receiver	2	-	
$t_{v(SD\_B\_ST)}$	Data output valid time	Slave transmitter (after enable edge) $2.7 \leq V_{DD} \leq 3.6$	-	14	
		Slave transmitter (after enable edge) $1.62 \leq V_{DD} \leq 3.6$	-	20	
$t_{h(SD\_B\_ST)}$	Data output hold time	Slave transmitter (after enable edge)	9	-	
$t_{v(SD\_A\_MT)}$	Data output valid time	Master transmitter (after enable edge) $2.7 \leq V_{DD} \leq 3.6$	-	12	
		Master transmitter (after enable edge) $1.62 \leq V_{DD} \leq 3.6$	-	19	
$t_{h(SD\_A\_MT)}$	Data output hold time	Master transmitter (after enable edge)	7.5	-	

1. Guaranteed by characterization results.
2. APB clock frequency must be at least twice SAI clock frequency.
3. With  $F_S=192$  kHz.

## 7 Package information

In order to meet environmental requirements, ST offers these devices in different grades of ECOPACK<sup>®</sup> packages, depending on their level of environmental compliance. ECOPACK<sup>®</sup> specifications, grade definitions and product status *are available at* [www.st.com](http://www.st.com). ECOPACK<sup>®</sup> is an ST trademark.

### 7.1 LQFP144 package information

LQFP144 is a 144-pin, 20 x 20 mm low-profile quad flat package.

Figure 70. LQFP144 package outline

1. Drawing is not to scale.

Table 129. LQFP144 package mechanical data

Symbol	millimeters			inches <sup>(1)</sup>		
	Min	Typ	Max	Min	Typ	Max

1. Values in inches are converted from mm and rounded to 4 decimal digits.

Figure 71. LQFP144 package recommended footprint

1. Dimensions are expressed in millimeters.

**Device marking for LQFP144**

The following figure gives an example of topside marking versus pin 1 position identifier location.

The printed markings may differ depending on the supply chain.

Other optional marking or inset/upset marks, which depend on supply chain operations, are not indicated below.

**Figure 72. LQFP144 marking example (package top view)**

1. Parts marked as “ES”, “E” or accompanied by an Engineering Sample notification letter, are not yet qualified and therefore not approved for use in production. ST is not responsible for any consequences resulting from such use. In no event will ST be liable for the customer using any of these engineering samples in production. ST’s Quality department must be contacted prior to any decision to use these engineering samples to run a qualification activity.

## 7.2 LQFP176 package information

LQFP176 is a 176-pin, 24 x 24 mm low profile quad flat package.

Figure 73. LQFP176 package outline

1. Drawing is not to scale.

Table 130. LQFP176 package mechanical data

ST’s Quality department must be contacted prior to any decision to use these engineering samples to run a qualification activity.

## 7.6 Thermal characteristics

The maximum chip-junction temperature,  $T_J \text{ max}$ , in degrees Celsius, may be calculated using the following equation:

$$T_J \text{ max} = T_A \text{ max} + (P_D \text{ max} \times \Theta_{JA})$$

Where:

- $T_A \text{ max}$  is the maximum ambient temperature in °C,
- $\Theta_{JA}$  is the package junction-to-ambient thermal resistance, in °C/W,
- $P_D \text{ max}$  is the sum of  $P_{INT \text{ max}}$  and  $P_{I/O \text{ max}}$  ( $P_D \text{ max} = P_{INT \text{ max}} + P_{I/O \text{ max}}$ ),
- $P_{INT \text{ max}}$  is the product of  $I_{DD}$  and  $V_{DD}$ , expressed in Watts. This is the maximum chip internal power.

$P_{I/O \text{ max}}$  represents the maximum power dissipation on output pins where:

$$P_{I/O \text{ max}} = \Sigma (V_{OL} \times I_{OL}) + \Sigma (V_{DD} - V_{OH}) \times I_{OH},$$

taking into account the actual  $V_{OL} / I_{OL}$  and  $V_{OH} / I_{OH}$  of the I/Os at low and high level in the application.

**Table 136. Thermal characteristics**

Symbol	Definition	Parameter	Value	Unit
$\Theta_{JA}$	Thermal resistance junction-ambient	Thermal resistance junction-ambient LQFP144 - 20 x 20 mm /0.5 mm pitch	43.7	°C/W
		Thermal resistance junction-ambient LQFP176 - 24 x 24 mm /0.5 mm pitch	43.0	
		Thermal resistance junction-ambient LQFP208 - 28 x 28 mm /0.5 mm pitch	42.4	
		Thermal resistance junction-ambient UFBGA176+25 - 10 x 10 mm /0.65 mm pitch	37.4	
		Thermal resistance junction-ambient TFBGA240+25 - 14 x 14 mm / 0.8 mm pitch	36.6	
$\Theta_{JC}$	Thermal resistance junction-case	Thermal resistance junction-ambient LQFP144 - 20 x 20 mm /0.5 mm pitch	11.3	°C/W
		Thermal resistance junction-ambient LQFP176 - 24 x 24 mm /0.5 mm pitch	11.2	
		Thermal resistance junction-ambient LQFP208 - 28 x 28 mm /0.5 mm pitch	11.1	
		Thermal resistance junction-ambient UFBGA176+25 - 10 x 10 mm /0.65 mm pitch	23.9	
		Thermal resistance junction-ambient TFBGA240+25 - 14 x 14 mm / 0.8 mm pitch	7.4	

Table 136. Thermal characteristics

Symbol	Definition	Parameter	Value	Unit
$\Theta_{JB}$	Thermal resistance junction-board	<b>Thermal resistance junction-ambient</b> LQFP144 - 20 x 20 mm /0.5 mm pitch	38.3	°C/W
		<b>Thermal resistance junction-ambient</b> LQFP176 - 24 x 24 mm /0.5 mm pitch	39.4	
		<b>Thermal resistance junction-ambient</b> LQFP208 - 28 x 28 mm /0.5 mm pitch	40.3	
		<b>Thermal resistance junction-ambient</b> UFBGA176+25 - 10 x 10 mm /0.65 mm pitch	19.3	
		<b>Thermal resistance junction-ambient</b> TFBGA240+25 - 14 x 14 mm / 0.8 mm pitch	24.3
