

Ultra-low-power Arm<sup>®</sup> Cortex<sup>®</sup>-M4 32-bit MCU+FPU, 100DMIPS, 1MB Flash, 320KB SRAM, USB OTG FS, audio, AES+HASH, ext. SMPS

Datasheet - production data

## Features

### Includes ST state-of-the-art patented technology

- Ultra-low-power with FlexPowerControl
  - 1.71 V to 3.6 V power supply
  - -40 °C to 85/125 °C temperature range
  - 320 nA in V<sub>BAT</sub> mode: supply for RTC and 32x32-bit backup registers
  - 25 nA Shutdown mode (5 wakeup pins)
  - 108 nA Standby mode (5 wakeup pins)
  - 426 nA Standby mode with RTC
  - 2.57 µA Stop 2 mode, 2.86 µA Stop 2 with RTC
  - 91 µA/MHz run mode (LDO mode)
  - 37 µA/MHz run mode (at 3.3 V SMPS mode)
  - Batch acquisition mode (BAM)
  - 5 µs wakeup from Stop mode
  - Brown out reset (BOR) in all modes except shutdown
  - Interconnect matrix
- Core: Arm<sup>®</sup> 32-bit Cortex<sup>®</sup>-M4 CPU with FPU, Adaptive real-time accelerator (ART Accelerator™) allowing 0-wait-state execution from Flash memory, frequency up to 80 MHz, MPU, 100 DMIPS and DSP instructions
- Performance benchmark
  - 1.25 DMIPS/MHz (Drystone 2.1)
  - 273.55 Coremark<sup>®</sup> (3.42 Coremark/MHz at 80 MHz)
- Energy benchmark
  - 279 ULPMark™ CP score
  - 80.2 ULPMark™ PP score
- 16 timers: 2x 16-bit advanced motor-control, 2x 32-bit and 5x 16-bit general purpose, 2x 16-bit basic, 2x low-power 16-bit timers (available in Stop mode), 2x watchdogs, SysTick timer
- RTC with HW calendar, alarms and calibration
- Up to 136 fast I/Os, most 5 V-tolerant, up to 14 I/Os with independent supply down to 1.08 V
- Dedicated Chrom-ART Accelerator for enhanced graphic content creation (DMA2D)
- 8- to 14-bit camera interface up to 32 MHz (black & white) or 10 MHz (color)
- Encryption hardware accelerator: AES (128/256-bit key), HASH (SHA-256)
- Memories
  - 1 MB Flash, 2 banks read-while-write, proprietary code readout protection
  - 320 KB of SRAM including 64 KB with hardware parity check
  - External memory interface for static memories supporting SRAM, PSRAM, NOR and NAND memories
  - Dual-flash Quad SPI memory interface
- Clock sources
  - 4 to 48 MHz crystal oscillator
  - 32 kHz crystal oscillator for RTC (LSE)
  - Internal 16 MHz factory-trimmed RC (±1%)
  - Internal low-power 32 kHz RC (±5%)
  - Internal multispeed 100 kHz to 48 MHz oscillator, auto-trimmed by LSE (better than ±0.25% accuracy)
  - Internal 48 MHz with clock recovery
  - 3 PLLs for system clock, USB, audio, ADC
- LCD 8× 40 or 4× 44 with step-up converter
- Up to 24 capacitive sensing channels: support touchkey, linear and rotary touch sensors
- 4x digital filters for sigma delta modulator

- Rich analog peripherals (independent supply)
  - 3× 12-bit ADCs 5 Msps, up to 16-bit with hardware oversampling, 200  $\mu$ A/Msps
  - 2x 12-bit DAC output channels, low-power sample and hold
  - 2x operational amplifiers with built-in PGA
  - 2x ultra-low-power comparators
- 20x communication interfaces
  - USB OTG 2.0 full-speed, LPM and BCD
  - 2x SAs (serial audio interface)
  - 4x I2C FM+(1 Mbit/s), SMBus/PMBus
  - 5x U(S)ARTs (ISO 7816, LIN, IrDA, modem)
- 1x LPUART
- 3x SPIs (4x SPIs with the Quad SPI)
- 2x CANs (2.0B Active) and SDMMC
- SWPMI single wire protocol master I/F
- IRTIM (Infrared interface)
- 14-channel DMA controller
- True random number generator
- CRC calculation unit, 96-bit unique ID
- Development support: serial wire debug (SWD), JTAG, Embedded Trace Macrocell™

# 1 Introduction

This datasheet provides the ordering information and mechanical device characteristics of the STM32L4A6xG microcontrollers.

This document must be read in conjunction with the STM32L47x, STM32L48x, STM32L49x and STM32L4Ax reference manual (RM0351), available from the STMicroelectronics website [www.st.com](http://www.st.com).

For information on the Arm<sup>®(a)</sup> Cortex<sup>®</sup>-M4 core, refer to the Cortex<sup>®</sup>-M4 Technical Reference Manual, available from the [www.arm.com](http://www.arm.com) website.

For information on the device errata with respect to the datasheet and reference manual, refer to the STM32L4A6xG errata sheet (ES0335), available on the STMicroelectronics website [www.st.com](http://www.st.com).

## 2 Description

The STM32L4A6xG devices are ultra-low-power microcontrollers based on the high-performance Arm<sup>®</sup> Cortex<sup>®</sup>-M4 32-bit RISC core operating at a frequency of up to 80 MHz. The Cortex-M4 core features a Floating point unit (FPU) single precision that supports all Arm<sup>®</sup> single-precision data-processing instructions and data types. It also implements a full set of DSP instructions and a memory protection unit (MPU) which enhances application security.

The STM32L4A6xG devices embed high-speed memories (1 Mbyte of Flash memory, 320 Kbyte of SRAM), a flexible external memory controller (FSMC) for static memories (for devices with packages of 100 pins and more), a Quad SPI Flash memories interface (available on all packages) and an extensive range of enhanced I/Os and peripherals connected to two APB buses, two AHB buses and a 32-bit multi-AHB bus matrix.

The STM32L4A6xG devices embed several protection mechanisms for embedded Flash memory and SRAM: readout protection, write protection, proprietary code readout protection and Firewall.

The devices offer up to three fast 12-bit ADCs (5 Msps), two comparators, two operational amplifiers, two DAC channels, an internal voltage reference buffer, a low-power RTC, two general-purpose 32-bit timer, two 16-bit PWM timers dedicated to motor control, seven general-purpose 16-bit timers, and two 16-bit low-power timers. The devices support four digital filters for external sigma delta modulators (DFSDM).

In addition, up to 24 capacitive sensing channels are available. The devices also embed an integrated LCD driver 8x40 or 4x44, with internal step-up converter.

They also feature standard and advanced communication interfaces, namely four I2Cs, three SPIs, three USARTs, two UARTs and one Low-Power UART, two SAIs, one SDMMC, two CANs, one USB OTG full-speed, one SWPMI (single wire protocol master interface), a camera interface and a DMA2D controller.

The STM32L4A6xG devices embed AES and HASH hardware accelerators.

The STM32L4A6xG operates in the -40 to +85 °C (+105 °C junction), -40 to +125 °C (+130 °C junction) temperature ranges from a 1.71 to 3.6 V  $V_{DD}$  power supply when using internal LDO regulator and a 1.05 to 1.32V  $V_{DD12}$  power supply when using external SMPS supply. A comprehensive set of power-saving modes makes possible the design of low-power applications.

Some independent power supplies are supported: analog independent supply input for ADC, DAC, OPAMPs and comparators, 3.3 V dedicated supply input for USB and up to 14 I/Os can be supplied independently down to 1.08 V. A VBAT input makes it possible to backup the RTC and backup registers. Dedicated  $V_{DD12}$  power supplies can be used to bypass the internal LDO regulator when connected to an external SMPS.

The STM32L4A6xG family offers six packages from 64-pin to 169-pin packages.

Table 2. STM32L4A6xG family device features and peripheral counts

Peripheral		STM32L4A6AG	STM32L4A6ZG	STM32L4A6QG	STM32L4A6VG	STM32L4A6RG
Flash memory		1 MB				
SRAM		320 KB				
External memory controller for static memories		Yes	Yes	Yes	Yes <sup>(1)</sup>	No
Quad SPI		Yes				
Timers	Advanced control	2 (16-bit)				
	General purpose	5 (16-bit) 2 (32-bit)				
	Basic	2 (16-bit)				
	Low power	2 (16-bit)				
	SysTick timer	1				
	Watchdog timers (independent window)	2				
Comm. interfaces	SPI	3				
	I <sup>2</sup> C	4				
	USART	3				
	UART	2				
	LPUART	1				
	SAI	2				
	CAN	2				
	USB OTG FS	Yes				
	SDMMC	Yes				
SWPMI	Yes					
Digital filters for sigma-delta modulators		Yes (4 filters)				
Number of channels		8				
RTC		Yes				
Tamper pins		3				
Camera interface		Yes			Yes <sup>(2)</sup>	
Chrom-ART Accelerator™		Yes				
LCD COM x SEG		Yes 8x40 or 4x44				
Random generator		Yes				

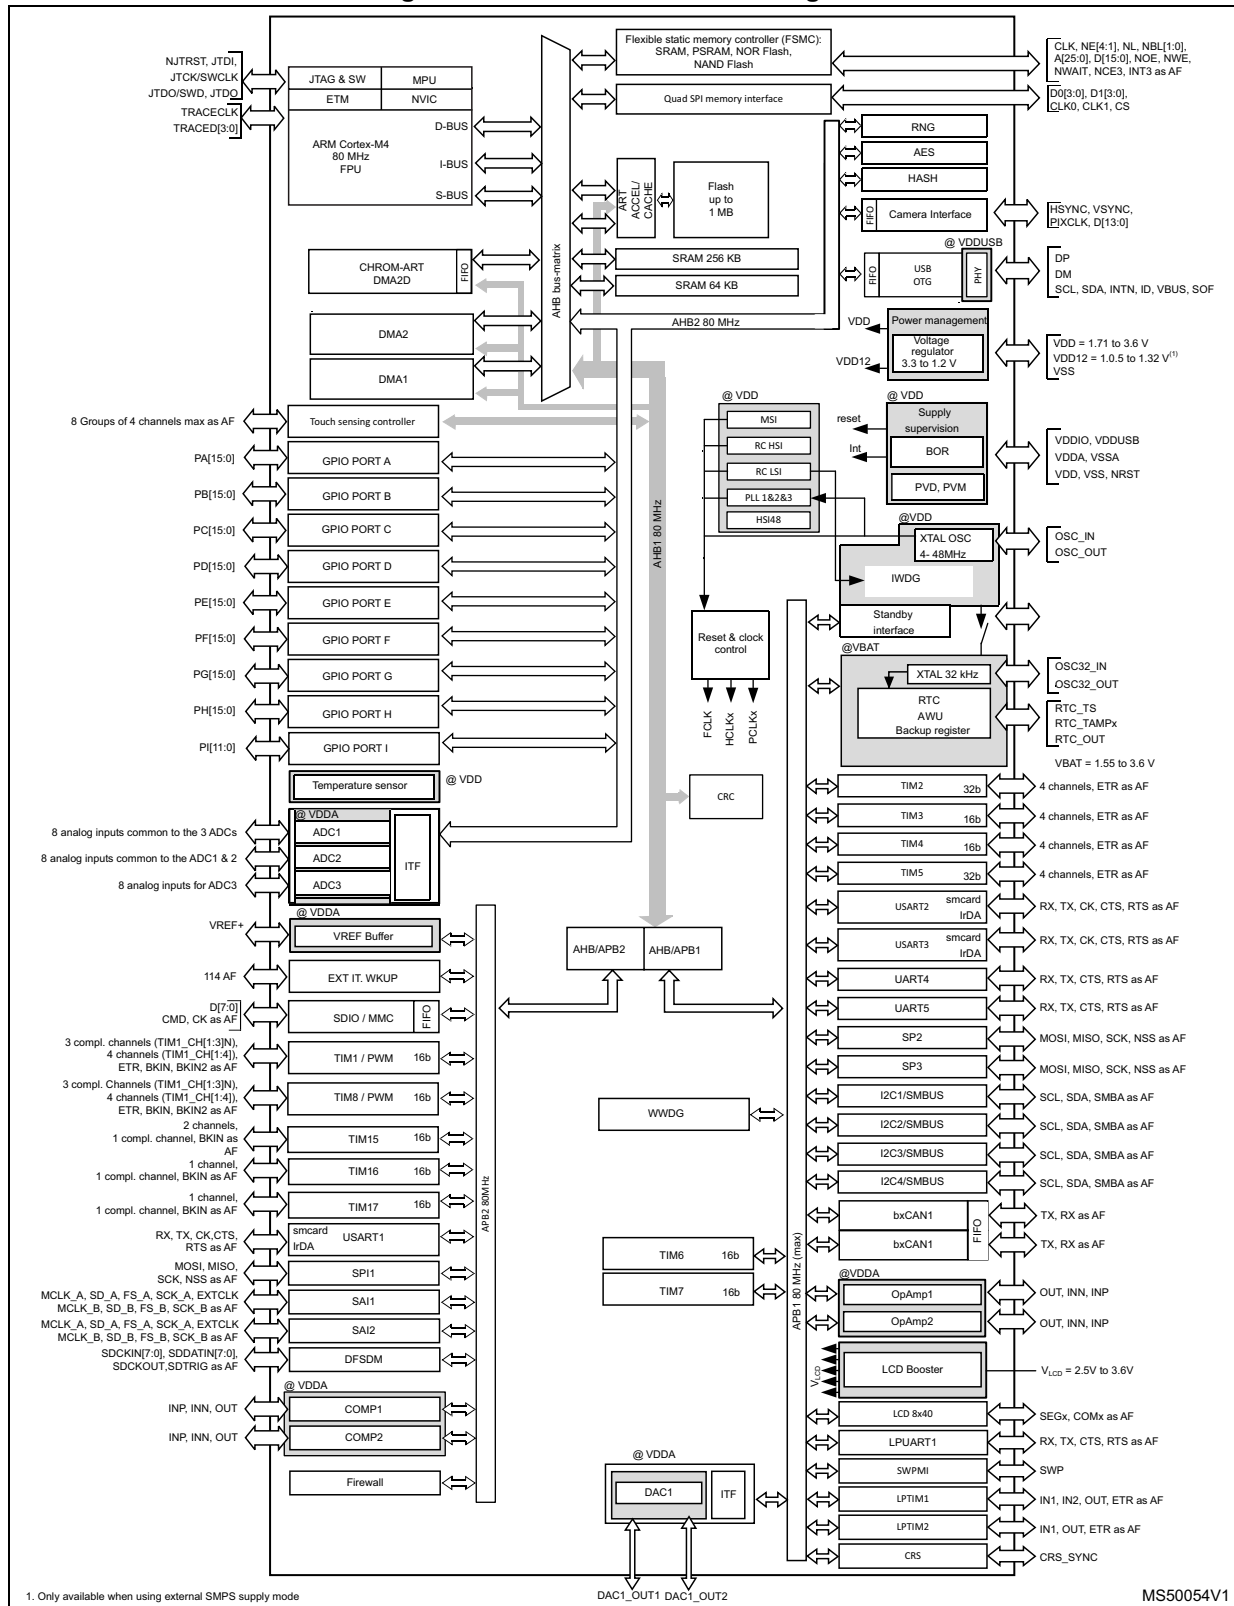

Table 2. STM32L4A6xG family device features and peripheral counts (continued)

Peripheral	STM32L4A6AG	STM32L4A6ZG	STM32L4A6QG	STM32L4A6VG	STM32L4A6RG
AES + HASH	Yes				
GPIOs <sup>(3)</sup>	136	115	110	83	52
Wakeup pins	5	5	5	5	4
Nb of I/Os down to 1.08 V	14	14	14	0	0

12-bit ADCs Number of channels	3 24	3 24	3 19	3 16	3 16
12-bit DAC channels	2				
Internal voltage reference buffer	Yes				
Analog comparator	2				
Operational amplifiers	2				
Max. CPU frequency	80 MHz				
Operating voltage (V <sub>DD</sub> )	1.71 to 3.6 V				
Operating voltage (V <sub>DD12</sub> )	1.05 to 1.32 V				
Operating temperature	Ambient operating temperature: -40 to 85 °C / -40 to 125 °C Junction temperature: -40 to 105 °C / -40 to 130 °C				
Packages	UFBGA169	LQFP144	UFBGA132	LQFP100 WLCSP100	LQFP64

1. For the LQFP100 and WLCSP100 packages, only FMC Bank1 is available. Bank1 can only support a multiplexed NOR/PSRAM memory using the NE1 Chip Select.
2. Only up to 13 data bits.
3. In case external SMPS package type is used, two GPIO's are replaced by VDD12 pins to connect the SMPS power supplies hence reducing the number of available GPIO's by two.

Figure 1. STM32L4A6xG block diagram

Note: AF: alternate function on I/O pins.

## 3 Functional overview

### 3.1 Arm<sup>®</sup> Cortex<sup>®</sup>-M4 core with FPU

The Arm<sup>®</sup> Cortex<sup>®</sup>-M4 with FPU processor is the latest generation of Arm<sup>®</sup> processors for embedded systems, developed to provide a low-cost platform that meets the needs of MCU implementation with a reduced pin count and low-power consumption, while delivering outstanding computational performance and an advanced response to interrupts.

The Arm<sup>®</sup> Cortex<sup>®</sup>-M4 with FPU 32-bit RISC processor features exceptional code-efficiency, delivering the high-performance expected from an Arm<sup>®</sup> core in the memory size usually associated with 8- and 16-bit devices.

The processor supports a set of DSP instructions enabling efficient signal processing and complex algorithm execution.

Its single precision FPU speeds up software development by using metalanguage development tools, while avoiding saturation.

With its embedded Arm<sup>®</sup> core, the STM32L4A6xG family is compatible with all Arm<sup>®</sup> tools and software.

*Figure 1* shows the general block diagram of the STM32L4A6xG family devices.

### 3.2 Adaptive real-time memory accelerator (ART Accelerator™)

The ART Accelerator™ is a memory accelerator optimized for STM32 industry-standard Arm<sup>®</sup> Cortex<sup>®</sup>-M4 processors. It balances the inherent performance advantage of the Arm<sup>®</sup> Cortex<sup>®</sup>-M4 over Flash memory technologies, which normally requires the processor to wait for the Flash memory at higher frequencies.

To release the processor near 100 DMIPS performance at 80 MHz, the accelerator implements an instruction prefetch queue and branch cache, which increases program execution speed from the 64-bit Flash memory. Based on CoreMark benchmark, the performance achieved thanks to the ART accelerator is equivalent to 0 wait state program execution from Flash memory at a CPU frequency up to 80 MHz.

### 3.3 Memory protection unit

The memory protection unit (MPU) is used to manage the CPU accesses to memory to prevent one task to accidentally corrupt the memory or resources used by any other active task. This memory area is organized into up to 8 protected areas that can in turn be divided up into 8 subareas. The protection area sizes are between 32 bytes and the whole 4 Gigabytes of addressable memory.

The MPU is especially helpful for applications where some critical or certified code has to be protected against the misbehavior of other tasks. It is usually managed by an RTOS (real-time operating system). If a program accesses a memory location that is prohibited by the MPU, the RTOS can detect it and take action. In an RTOS environment, the kernel can dynamically update the MPU area setting, based on the process to be executed.

The MPU is optional and can be bypassed for applications that do not need it.

### 3.4 Embedded Flash memory

STM32L4A6xG devices feature 1 Mbyte of embedded Flash memory available for storing programs and data. The Flash memory is divided into two banks allowing read-while-write operations. This feature permits to perform a read operation from one bank while an erase or program operation is performed to the other bank. The dual bank boot is also supported. Each bank contains 256 pages of 2 Kbyte.

Flexible protections can be configured thanks to option bytes:

- Readout protection (RDP) to protect the whole memory. Three levels are available:
  - Level 0: no readout protection
  - Level 1: memory readout protection: the Flash memory cannot be read from or written to if either debug features are connected, boot in RAM or bootloader is selected
  - Level 2: chip readout protection: debug features (Cortex-M4 JTAG and serial wire), boot in RAM and bootloader selection are disabled (JTAG fuse). This selection is irreversible.

**Table 3. Access status versus readout protection level and execution modes**

Area	Protection level	User execution			Debug, boot from RAM or boot from system memory (loader)		
		Read	Write	Erase	Read	Write	Erase
Main memory	1	Yes	Yes	Yes	No	No	No
	2	Yes	Yes	Yes	N/A	N/A	N/A
System memory	1	Yes	No	No	Yes	No	No
	2	Yes	No	No	N/A	N/A	N/A
Option bytes	1	Yes	Yes	Yes	Yes	Yes	Yes
	2	Yes	No	No	N/A	N/A	N/A
Backup registers	1	Yes	Yes	N/A <sup>(1)</sup>	No	No	N/A <sup>(1)</sup>
	2	Yes	Yes	N/A	N/A	N/A	N/A
SRAM2	1	Yes	Yes	Yes <sup>(1)</sup>	No	No	No <sup>(1)</sup>
	2	Yes	Yes	Yes	N/A	N/A	N/A

1. Erased when RDP change from Level 1 to Level 0.

- Write protection (WRP): the protected area is protected against erasing and programming. Two areas per bank can be selected, with 2-Kbyte granularity.
- Proprietary code readout protection (PCROP): a part of the flash memory can be protected against read and write from third parties. The protected area is execute-only: it can only be reached by the STM32 CPU, as an instruction code, while all other accesses (DMA, debug and CPU data read, write and erase) are strictly prohibited. One area per bank can be selected, with 64-bit granularity. An additional option bit (PCROP\_RDP) allows the user to select if the PCROP area is erased or not when the RDP protection is changed from Level 1 to Level 0.

The whole non-volatile memory embeds the error correction code (ECC) feature supporting:

- single error detection and correction
- double error detection.

The address of the ECC fail can be read in the ECC register.

### 3.5 Embedded SRAM

STM32L4A6xG devices feature 320 Kbyte of embedded SRAM, split into two blocks:

- 256 Kbyte mapped at address 0x2000 0000 (SRAM1)
- 64 Kbyte located at address 0x1000 0000 with hardware parity check (SRAM2).

This memory is also mapped at address 0x2004 0000, offering a contiguous address space with the SRAM1.

This block is accessed through the ICode/DCode buses for maximum performance.

These 64 Kbyte SRAM can also be retained in Standby mode.

The SRAM2 can be write-protected with 1 Kbyte granularity.

The memory can be accessed in read/write at CPU clock speed with 0 wait states.

### 3.6 Multi-AHB bus matrix

The 32-bit multi-AHB bus matrix interconnects all the masters (CPU, DMAs and the DMA2D) and the slaves (Flash memory, RAM, FMC, QUADSPI, AHB and APB peripherals) and ensures a seamless and efficient operation even when several high speed peripherals work simultaneously.

Figure 2. Multi-AHB bus matrix

### 3.7 Firewall

The device embeds a Firewall which protects code sensitive and secure data from any access performed by a code executed outside of the protected areas.

Each illegal access generates a reset which kills immediately the detected intrusion.

The Firewall main features are the following:

- Three segments can be protected and defined thanks to the Firewall registers:
  - Code segment (located in Flash or SRAM1 if defined as executable protected area)
  - Non-volatile data segment (located in Flash)
  - Volatile data segment (located in SRAM1)
- The start address and the length of each segments are configurable:
  - Code segment: up to 1024 Kbyte with granularity of 256 bytes
  - Non-volatile data segment: up to 1024 Kbyte with granularity of 256 bytes
  - Volatile data segment: up to 256 Kbyte of SRAM1 with a granularity of 64 bytes
- Specific mechanism implemented to open the Firewall to get access to the protected areas (call gate entry sequence)
- Volatile data segment can be shared or not with the non-protected code
- Volatile data segment can be executed or not depending on the Firewall configuration

The Flash readout protection must be set to level 2 in order to reach the expected level of protection.

### 3.8 Boot modes

At startup, BOOT0 pin and nBOOT1 option bit are used to select one of three boot options:

- Boot from user Flash memory
- Boot from system memory
- Boot from embedded SRAM

The boot loader is located in system memory. It is used to reprogram the Flash memory by using USART, I2C, SPI, CAN or USB OTG FS in Device mode through DFU (device firmware upgrade).

BOOT0 value may come from the PH3-BOOT0 pin or from an option bit depending on the value of a user option bit to free the GPIO pad if needed.

An empty check mechanism is implemented to force the boot from system Flash if the first memory location is not programmed and if the boot selection is configured to boot from main Flash. If the boot selection uses BOOT0 pin to boot from the main Flash memory, but the first Flash memory location is found empty, the flash empty check mechanism forces boot from the system memory (containing embedded bootloader). Then due to bootloader activation, some of the GPIOs are reconfigured from the High-Z state. Please refer to AN2606 for more details concerning the bootloader and GPIOs configuration in system memory boot mode.

It is possible to disable this feature by configuring the option bytes (instead of BOOT0 pin) to force boot from the main Flash memory (nSWBOOT0 = 0, nBOOT0 = 1).

### 3.9 Cyclic redundancy check calculation unit (CRC)

The CRC (cyclic redundancy check) calculation unit is used to get a CRC code using a configurable generator polynomial value and size.

Among other applications, CRC-based techniques are used to verify data transmission or storage integrity. In the scope of the EN/IEC 60335-1 standard, they offer a means of

verifying the Flash memory integrity. The CRC calculation unit helps compute a signature of the software during runtime, to be compared with a reference signature generated at link-time and stored at a given memory location.

## 3.10 Power supply management

### 3.10.1 Power supply schemes

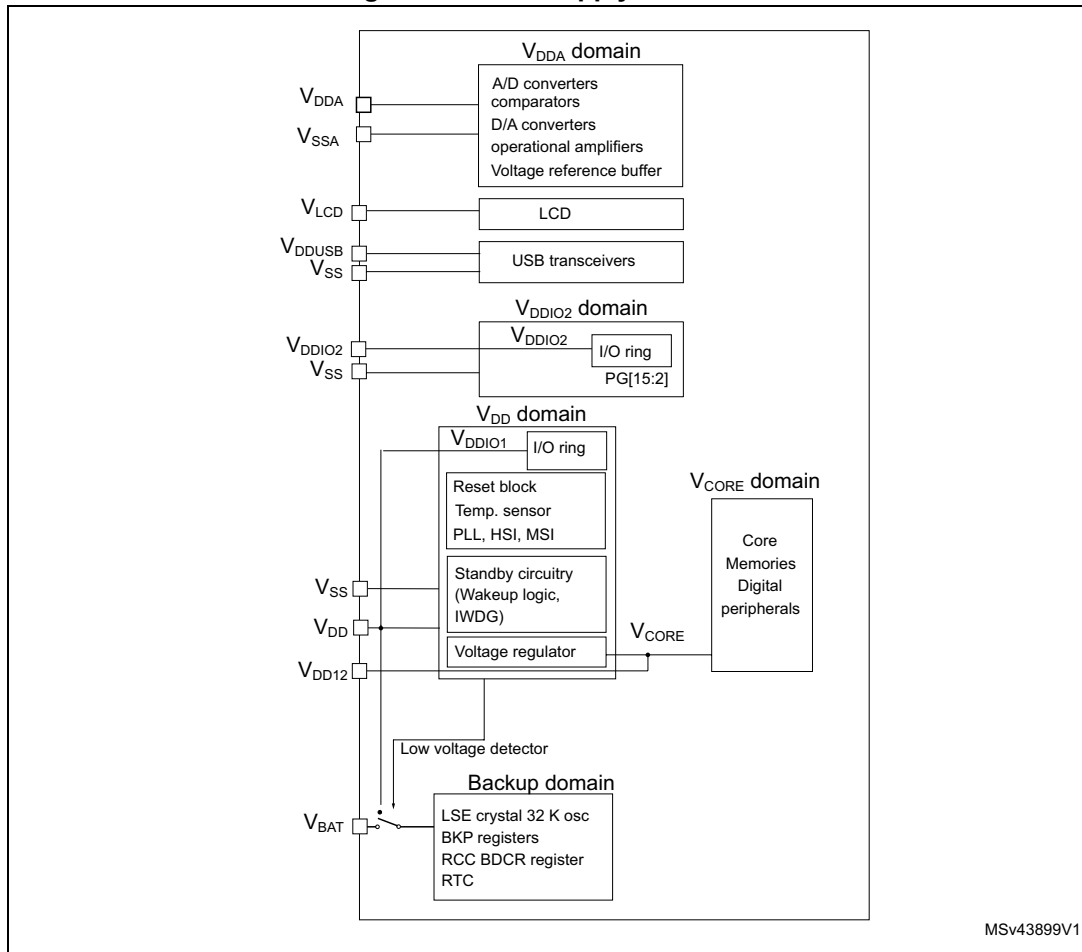

- $V_{DD} = 1.71$  to  $3.6$  V: external power supply for I/Os ( $V_{DDIO1}$ ), the internal regulator and the system analog such as reset, power management and internal clocks. It is provided externally through VDD pins.
- $V_{DD12} = 1.05$  to  $1.32$  V: external power supply bypassing internal regulator when connected to an external SMPS. It is provided externally through VDD12 pins and only available on packages with the external SMPS supply option. VDD12 does not require any external decoupling capacitance and cannot support any external load.
- $V_{DDA} = 1.62$  V (ADCs/COMP) /  $1.8$  (DAC/OPAMP) to  $3.6$  V: external analog power supply for ADCs, DAC, OPAMPs, Comparators and Voltage reference buffer. The  $V_{DDA}$  voltage level is independent from the  $V_{DD}$  voltage.
- $V_{DDUSB} = 3.0$  to  $3.6$  V: external independent power supply for USB transceivers. The  $V_{DDUSB}$  voltage level is independent from the  $V_{DD}$  voltage.
- $V_{DDIO2} = 1.08$  to  $3.6$  V: external power supply for 14 I/Os (PG[15:2]). The  $V_{DDIO2}$  voltage level is independent from the  $V_{DD}$  voltage.
- $V_{LCD} = 2.5$  to  $3.6$  V: the LCD controller can be powered either externally through VLCD pin, or internally from an internal voltage generated by the embedded step-up converter.
- $V_{BAT} = 1.55$  to  $3.6$  V: power supply for RTC, external clock 32 kHz oscillator and backup registers (through power switch) when  $V_{DD}$  is not present.

*Note:* When the functions supplied by  $V_{DDA}$ ,  $V_{DDUSB}$  or  $V_{DDIO2}$  are not used, these supplies should preferably be shorted to  $V_{DD}$ .

*Note:* If these supplies are tied to ground, the I/Os supplied by these power supplies are not 5 V tolerant (refer to [Table 19: Voltage characteristics](#)).

*Note:*  $V_{DDIOx}$  is the I/Os general purpose digital functions supply.  $V_{DDIOx}$  represents  $V_{DDIO1}$  or  $V_{DDIO2}$ , with  $V_{DDIO1} = V_{DD}$ .  $V_{DDIO2}$  supply voltage level is independent from  $V_{DDIO1}$ .

Figure 3. Power supply overview

During power-up and power-down phases, the following power sequence requirements must be respected:

- When V<sub>DD</sub> is below 1 V, other power supplies (V<sub>DDA</sub>, V<sub>DDUSB</sub>, V<sub>DDIO2</sub>, V<sub>LCD</sub>) must remain below V<sub>DD</sub> + 300 mV.
- When V<sub>DD</sub> is above 1 V, all power supplies are independent.

During the power-down phase, V<sub>DD</sub> can temporarily become lower than other supplies only if the energy provided to the MCU remains below 1 mJ; this allows external decoupling capacitors to be discharged with different time constants during the power-down transient phase.

Figure 4. Power-up/down sequence

1.  $V_{DDX}$  refers to any power supply among  $V_{DDA}$ ,  $V_{DDUSB}$ ,  $V_{DDIO2}$ ,  $V_{LCD}$ .

### 3.10.2 Power supply supervisor

The device has an integrated ultra-low-power brown-out reset (BOR) active in all modes except Shutdown and ensuring proper operation after power-on and during power down. The device remains in reset mode when the monitored supply voltage  $V_{DD}$  is below a specified threshold, without the need for an external reset circuit.

The lowest BOR level is 1.71V at power on, and other higher thresholds can be selected through option bytes. The device features an embedded programmable voltage detector (PVD) that monitors the  $V_{DD}$  power supply and compares it to the VPVD threshold. An interrupt can be generated when  $V_{DD}$  drops below the VPVD threshold and/or when  $V_{DD}$  is higher than the VPVD threshold. The interrupt service routine can then generate a warning message and/or put the MCU into a safe state. The PVD is enabled by software.

In addition, the device embeds a Peripheral Voltage Monitor which compares the independent supply voltages  $V_{DDA}$ ,  $V_{DDUSB}$ ,  $V_{DDIO2}$  with a fixed threshold in order to ensure that the peripheral is in its functional supply range.

### 3.10.3 Voltage regulator

Two embedded linear voltage regulators supply most of the digital circuitries: the main regulator (MR) and the low-power regulator (LPR).

- The MR is used in the Run and Sleep modes and in the Stop 0 mode.
- The LPR is used in Low-Power Run, Low-Power Sleep, Stop 1 and Stop 2 modes. It is also used to supply the 64 Kbyte SRAM2 in Standby with SRAM2 retention.
- Both regulators are in power-down in Standby and Shutdown modes: the regulator output is in high impedance, and the kernel circuitry is powered down thus inducing zero consumption.

The ultralow-power STM32L4A6xG supports dynamic voltage scaling to optimize its power consumption in run mode. The voltage from the Main Regulator that supplies the logic ( $V_{CORE}$ ) can be adjusted according to the system's maximum operating frequency.

There are two power consumption ranges:

- Range 1 with the CPU running at up to 80 MHz.
- Range 2 with a maximum CPU frequency of 26 MHz. All peripheral clocks are also limited to 26 MHz.

The  $V_{CORE}$  can be supplied by the low-power regulator, the main regulator being switched off. The system is then in Low-power run mode.

- Low-power run mode with the CPU running at up to 2 MHz. Peripherals with independent clock can be clocked by HSI16.

When the MR is in use, the STM32L4A6xG with the external SMPS option permits to force an external  $V_{CORE}$  supply on the VDD12 supply pins.

When  $V_{DD12}$  is forced by an external source and is higher than the output of the internal LDO, the current is taken from this external supply and the overall power efficiency is significantly improved if using an external step down DC/DC converter.

### 3.10.4 Low-power modes

The ultra-low-power STM32L4A6xG supports seven low-power modes to achieve the best compromise between low-power consumption, short startup time, available peripherals and available wakeup sources.

**Table 4. STM32L4A6xG modes overview**

Mode	Regulator <sup>(1)</sup>	CPU	Flash	SRAM	Clocks	DMA and peripherals <sup>(2)</sup>	Wakeup source

	OFF			Power ed Off		All other peripherals are powered off. *** I/O configuration can be floating, pull-up or pull-down	
Shutdown	OFF	Power ed Off	Off	Power ed Off	LSE	RTC *** All other peripherals are powered off. *** I/O configuration can be floating, pull-up or pull- down <sup>(14)</sup>	Reset pin 5 I/Os (WKUP <sub>x</sub> ) <sup>(14)</sup> RTC

1. LPR means Main regulator is OFF and Low-power regulator is ON.
2. All peripherals can be active or clock gated to save power consumption.
3. Typical current at  $V_{DD} = 1.8\text{ V}$ ,  $25^{\circ}\text{C}$ . Consumptions values provided running from SRAM, Flash memory Off, 80 MHz in Range 1, 2, LPRun/LPSleep.
4. The Flash memory can be put in power-down and its clock can be gated off when executing from SRAM.
5. Theoretical value based on  $V_{DD} = 3.3\text{ V}$ , DC/DC Efficiency of 85%,  $V_{CORE} = 1.10\text{ V}$
6. Theoretical value based on  $V_{DD} = 3.3\text{ V}$ , DC/DC Efficiency of 85%,  $V_{CORE} = 1.05\text{ V}$
7. The SRAM1 and SRAM2 clocks can be gated on or off independently.
8. SMPS mode can be used in STOP0 Mode, but no significant power gain can be expected.
9. U(S)ART and LPUART reception is functional in Stop mode, and generates a wakeup interrupt on Start, address match or received.
10. I2C address detection is functional in Stop mode, and generates a wakeup interrupt in case of address match.
11. OTG\_FS wakeup by resume from suspend and attach detection protocol event.
12. SWPMI1 wakeup by resume from suspend.
13. The I/Os with wakeup from Standby/Shutdown capability are: PA0, PC13, PE6, PA2, PC5.
14. I/Os can be configured with internal pull-up, pull-down or floating in Shutdown mode but the configuration is lost when exiting the Stop mode.

By default, the microcontroller is in Run mode after a system or a power Reset. It is up to the user to select one of the low-power modes described below:

- **Sleep mode**

In Sleep mode, only the CPU is stopped. All peripherals continue to operate and can wake up the CPU when an interrupt/event occurs.

- **Low-power run mode**

This mode is achieved with  $V_{CORE}$  supplied by the low-power regulator to minimize the regulator's operating current. The code can be executed from SRAM or from Flash, and the CPU frequency is limited to 2 MHz. The peripherals with independent clock can be clocked by HSI16.

- **Low-power sleep mode**

This mode is entered from the low-power run mode. Only the CPU clock is stopped. When wakeup is triggered by an event or an interrupt, the system reverts to the low-power run mode.

- **Stop 0, Stop 1 and Stop 2 modes**

Stop mode achieves the lowest power consumption while retaining the content of SRAM and registers. All clocks in the  $V_{CORE}$  domain are stopped, the PLL, the MSI RC, the HSI16 RC and the HSE crystal oscillators are disabled. The LSE or LSI is still running.

The RTC can remain active (Stop mode with RTC, Stop mode without RTC).

Some peripherals with wakeup capability can enable the HSI16 RC during Stop mode to detect their wakeup condition.

Three Stop modes are available: Stop 0, Stop 1 and Stop 2 modes. In Stop 2 mode, most of the  $V_{CORE}$  domain is put in a lower leakage mode.

Stop 1 offers the largest number of active peripherals and wakeup sources, a smaller wakeup time but a higher consumption than Stop 2. In Stop 0 mode, the main regulator remains ON, allowing a very fast wakeup time but with much higher consumption.

The system clock when exiting from Stop 0, Stop 1 or Stop 2 modes can be either MSI up to 48 MHz or HSI16, depending on software configuration.

- **Standby mode**

The Standby mode is used to achieve the lowest power consumption with BOR. The internal regulator is switched off so that the  $V_{CORE}$  domain is powered off. The PLL, the MSI RC, the HSI16 RC and the HSE crystal oscillators are also switched off.

The RTC can remain active (Standby mode with RTC, Standby mode without RTC).

The brown-out reset (BOR) always remains active in Standby mode.

The state of each I/O during standby mode can be selected by software: I/O with internal pull-up, internal pull-down or floating.

After entering Standby mode, SRAM1 and register contents are lost except for registers in the Backup domain and Standby circuitry. Optionally, SRAM2 can be retained in Standby mode, supplied by the low-power Regulator (Standby with SRAM2 retention mode).

The device exits Standby mode when an external reset (NRST pin), an IWDG reset, WKUP pin event (configurable rising or falling edge), or an RTC event occurs (alarm, periodic wakeup, timestamp, tamper) or a failure is detected on LSE (CSS on LSE).

The system clock after wakeup is MSI up to 8 MHz.

- **Shutdown mode**

The Shutdown mode permits to achieve the lowest power consumption. The internal regulator is switched off so that the  $V_{CORE}$  domain is powered off. The PLL, the HSI16, the MSI, the LSI and the HSE oscillators are also switched off.

The RTC can remain active (Shutdown mode with RTC, Shutdown mode without RTC).

The BOR is not available in Shutdown mode. No power voltage monitoring is possible in this mode, therefore the switch to Backup domain is not supported.

SRAM1, SRAM2 and register contents are lost except for registers in the Backup domain.

The device exits Shutdown mode when an external reset (NRST pin), a WKUP pin event (configurable rising or falling edge), or an RTC event occurs (alarm, periodic wakeup, timestamp, tamper).

The system clock after wakeup is MSI at 4 MHz.

Table 5. Functionalities depending on the working mode<sup>(1)</sup>

- Legend: Y = Yes (Enable). O = Optional (Disable by default. Can be enabled by software). - = Not available.
- The Flash can be configured in power-down mode. By default, it is not in power-down mode.
- The SRAM clock can be gated on or off.
- SRAM2 content is preserved when the bit RRS is set in PWR\_CR3 register.
- Some peripherals with wakeup from Stop capability can request HSI16 to be enabled. In this case, HSI16 is woken up by the peripheral, and only feeds the peripheral which requested it. HSI16 is automatically put off when the peripheral does not need it anymore.
- UART and LPUART reception is functional in Stop mode, and generates a wakeup interrupt on Start, address match or received frame event.
- I2C address detection is functional in Stop mode, and generates a wakeup interrupt in case of address match.
- Voltage scaling Range 1 only.
- I/Os can be configured with internal pull-up, pull-down or floating in Standby mode.
- The I/Os with wakeup from Standby/Shutdown capability are: PA0, PC13, PE6, PA2, PC5.
- I/Os can be configured with internal pull-up, pull-down or floating in Shutdown mode but the configuration is lost when exiting the Shutdown mode.

### 3.10.5 Reset mode

In order to improve the consumption under reset, the I/Os state under and after reset is “analog state” (the I/O schmitt trigger is disable). In addition, the internal reset pull-up is deactivated when the reset source is internal.

### 3.10.6 VBAT operation

The VBAT pin permits to power the device VBAT domain from an external battery, an external supercapacitor, or from V<sub>DD</sub> when no external battery and an external

supercapacitor are present. The VBAT pin supplies the RTC with LSE and the backup registers. Three anti-tamper detection pins are available in VBAT mode.

VBAT operation is automatically activated when  $V_{DD}$  is not present.

An internal VBAT battery charging circuit is embedded and can be activated when  $V_{DD}$  is present.

*Note: When the microcontroller is supplied from VBAT, external interrupts and RTC alarm/events do not exit it from VBAT operation.*

### 3.11 Interconnect matrix

Several peripherals have direct connections between them. This allows autonomous communication between peripherals, saving CPU resources thus power supply consumption. In addition, these hardware connections allow fast and predictable latency.

Depending on peripherals, these interconnections can operate in Run, Sleep, low-power run and sleep, Stop 0, Stop 1 and Stop 2 modes.

**Table 6. STM32L4A6xG peripherals interconnect matrix**

Interconnect source	Interconnect destination	Interconnect action	Run	Sleep	Low-power run	Low-power sleep	Stop 0 / Stop 1	Stop 2

## 3.12 Clocks and startup

The clock controller (see [Figure 5](#)) distributes the clocks coming from different oscillators to the core and the peripherals. It also manages clock gating for low-power modes and ensures clock robustness. It features:

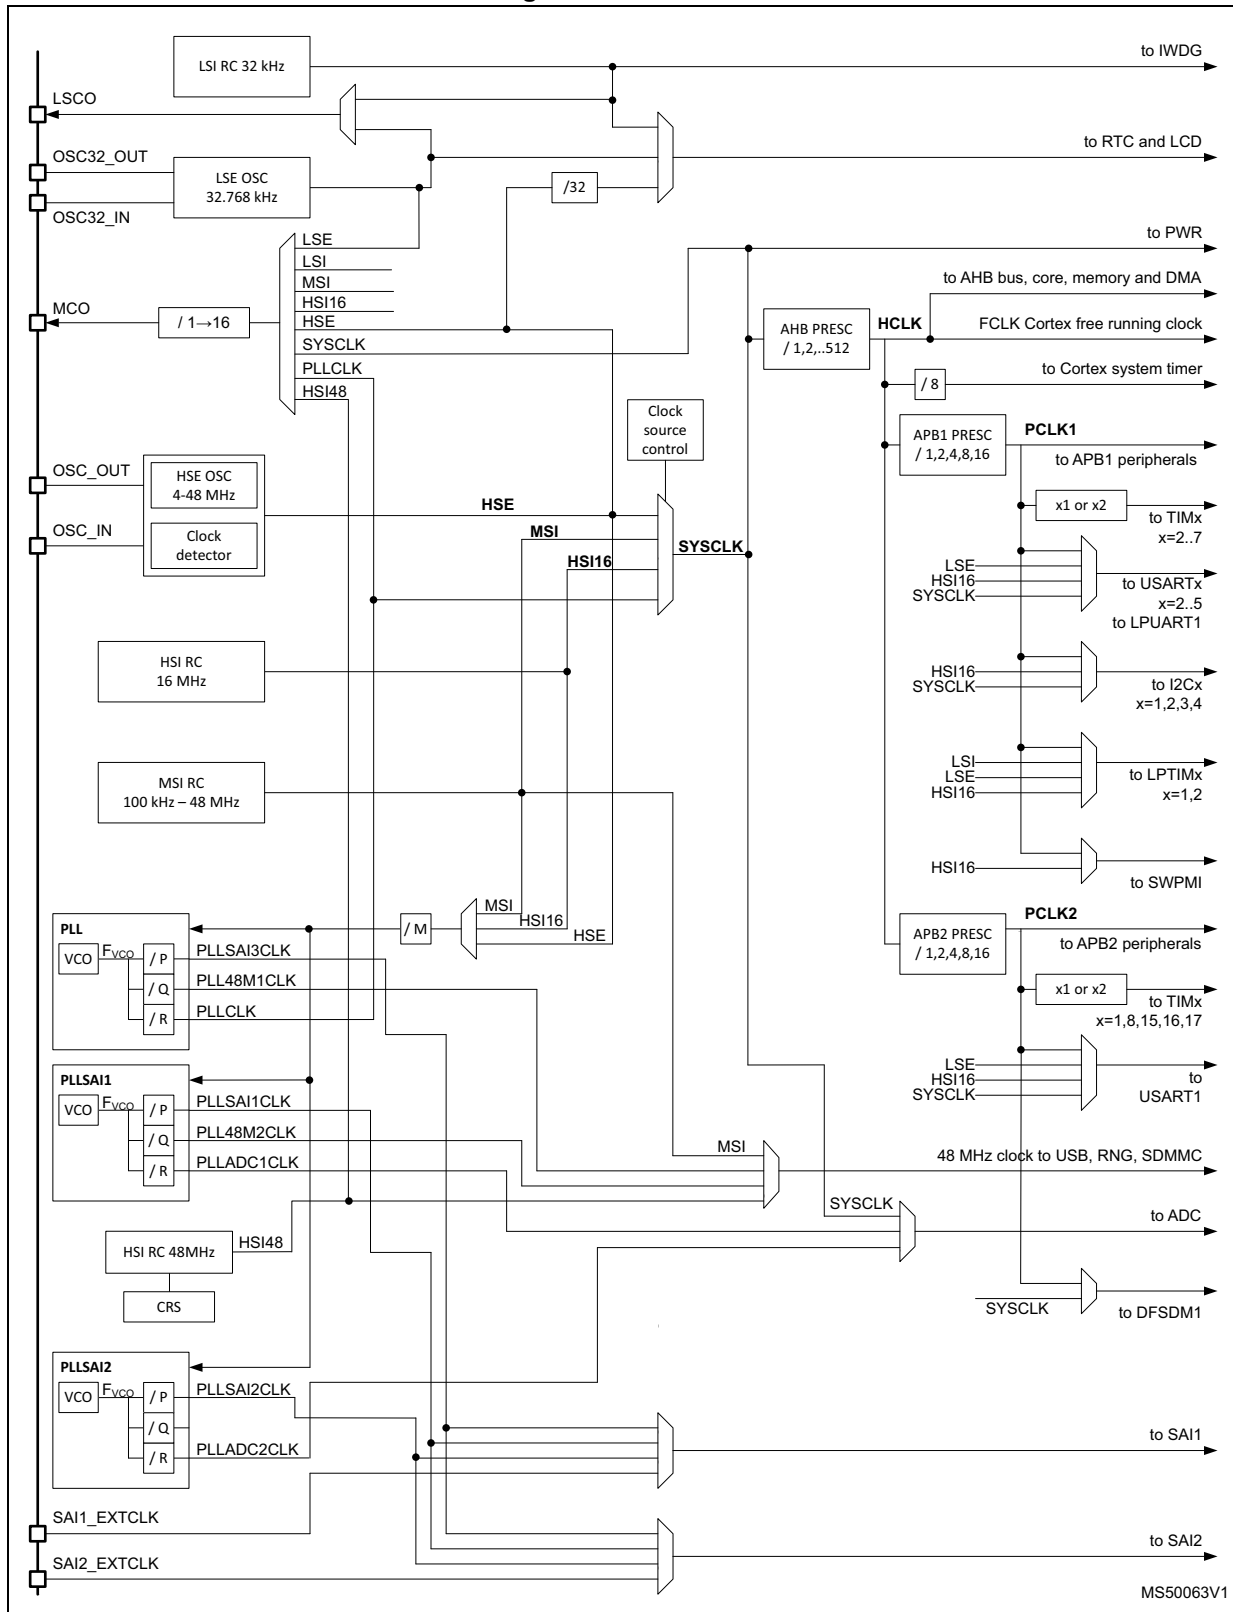

- **Clock prescaler:** to get the best trade-off between speed and current consumption, the clock frequency to the CPU and peripherals can be adjusted by a programmable prescaler
- **Safe clock switching:** clock sources can be changed safely on the fly in run mode through a configuration register.
- **Clock management:** to reduce power consumption, the clock controller can stop the clock to the core, individual peripherals or memory.
- **System clock source:** four different clock sources can be used to drive the master clock SYSCLK:
  - 4-48 MHz high-speed external crystal or ceramic resonator (HSE), that can supply a PLL. The HSE can also be configured in bypass mode for an external clock.
  - 16 MHz high-speed internal RC oscillator (HSI16), trimmable by software, that can supply a PLL
  - Multispeed internal RC oscillator (MSI), trimmable by software, able to generate 12 frequencies from 100 kHz to 48 MHz. When a 32.768 kHz clock source is available in the system (LSE), the MSI frequency can be automatically trimmed by hardware to reach better than  $\pm 0.25\%$  accuracy. In this mode the MSI can feed the USB device, saving the need of an external high-speed crystal (HSE). The MSI can supply a PLL.
  - System PLL which can be fed by HSE, HSI16 or MSI, with a maximum frequency at 80 MHz.
- RC48 with clock recovery system (HSI48): internal 48 MHz clock source (HSI48) can be used to drive the USB, the SDMMC or the RNG peripherals. This clock can be output on the MCO.
- **Auxiliary clock source:** two ultralow-power clock sources that can be used to drive the LCD controller and the real-time clock:
  - 32.768 kHz low-speed external crystal (LSE), supporting four drive capability modes. The LSE can also be configured in bypass mode for an external clock.
  - 32 kHz low-speed internal RC (LSI), also used to drive the independent watchdog. The LSI clock accuracy is  $\pm 5\%$  accuracy.
- **Peripheral clock sources:** Several peripherals (USB, SDMMC, RNG, SAI, USARTs, I2Cs, LPTimers, ADC, SWPMI) have their own independent clock whatever the system clock. Three PLLs, each having three independent outputs allowing the highest flexibility, can generate independent clocks for the ADC, the USB/SDMMC/RNG and the two SAIs.
- **Startup clock:** after reset, the microcontroller restarts by default with an internal 4 MHz clock (MSI). The prescaler ratio and clock source can be changed by the application program as soon as the code execution starts.
- **Clock security system (CSS):** this feature can be enabled by software. If a HSE clock failure occurs, the master clock is automatically switched to HSI16 and a software

interrupt is generated if enabled. LSE failure can also be detected and generated an interrupt.

- Clock-out capability:
  - **MCO: microcontroller clock output:** it outputs one of the internal clocks for external use by the application. Low frequency clocks (LSI, LSE) are available down to Stop 1 low power state.
  - **LSCO: low speed clock output:** it outputs LSI or LSE in all low-power modes down to Standby mode. LSE can also be output on LSCO in Shutdown mode. LSCO is not available in VBAT mode.

Several prescalers permit to configure the AHB frequency, the high speed APB (APB2) and the low speed APB (APB1) domains. The maximum frequency of the AHB and the APB domains is 80 MHz.

Figure 5. Clock tree

### 3.13 General-purpose inputs/outputs (GPIOs)

Each of the GPIO pins can be configured by software as output (push-pull or open-drain), as input (with or without pull-up or pull-down) or as peripheral alternate function. Most of the GPIO pins are shared with digital or analog alternate functions. Fast I/O toggling can be achieved thanks to their mapping on the AHB2 bus.

The I/Os alternate function configuration can be locked if needed following a specific sequence in order to avoid spurious writing to the I/Os registers.

### 3.14 Direct memory access controller (DMA)

The device embeds 2 DMAs. Refer to [Table 7: DMA implementation](#) for the features implementation.

Direct memory access (DMA) is used in order to provide high-speed data transfer between peripherals and memory as well as memory to memory. Data can be quickly moved by DMA without any CPU actions. This keeps CPU resources free for other operations.

The two DMA controllers have 14 channels in total, each dedicated to managing memory access requests from one or more peripherals. Each has an arbiter for handling the priority between DMA requests.

The DMA supports:

- 14 independently configurable channels (requests)
- Each channel is connected to dedicated hardware DMA requests, software trigger is also supported on each channel. This configuration is done by software.
- Priorities between requests from channels of one DMA are software programmable (4 levels consisting of very high, high, medium, low) or hardware in case of equality (example: request 1 has priority over request 2)
- Independent source and destination transfer size (byte, half word, word), emulating packing and unpacking. Source/destination addresses must be aligned on the data size.
- Support for circular buffer management
- 3 event flags (DMA Half Transfer, DMA Transfer complete and DMA Transfer Error) logically ORed together in a single interrupt request for each channel
- Memory-to-memory transfer
- Peripheral-to-memory and memory-to-peripheral, and peripheral-to-peripheral transfers
- Access to Flash, SRAM, APB and AHB peripherals as source and destination
- Programmable number of data to be transferred: up to 65536.

**Table 7. DMA implementation**

DMA features	DMA1	DMA2
Number of regular channels	7	7

## 3.15 Chrom-ART Accelerator™ (DMA2D)

The Chrom-Art Accelerator™ (DMA2D) is a graphic accelerator which offers advanced bit blitting, row data copy and pixel format conversion. It supports the following functions:

- Rectangle filling with a fixed color
- Rectangle copy
- Rectangle copy with pixel format conversion
- Rectangle composition with blending and pixel format conversion.

Various image format coding are supported, from indirect 4bpp color mode up to 32bpp direct color. It embeds dedicated memory to store color lookup tables.

An interrupt can be generated when an operation is complete or at a programmed watermark.

All the operations are fully automatized and are running independently from the CPU or the DMAs.

## 3.16 Interrupts and events

### 3.16.1 Nested vectored interrupt controller (NVIC)

The devices embed a nested vectored interrupt controller able to manage 16 priority levels, and handle up to 90 maskable interrupt channels plus the 16 interrupt lines of the Cortex®-M4.

The NVIC benefits are the following:

- Closely coupled NVIC gives low latency interrupt processing
- Interrupt entry vector table address passed directly to the core
- Allows early processing of interrupts
- Processing of late arriving higher priority interrupts
- Support for tail chaining
- Processor state automatically saved on interrupt entry, and restored on interrupt exit, with no instruction overhead

The NVIC hardware block provides flexible interrupt management features with minimal interrupt latency.

### 3.16.2 Extended interrupt/event controller (EXTI)

The extended interrupt/event controller consists of 41 edge detector lines used to generate interrupt/event requests and wake-up the system from Stop mode. Each external line can be independently configured to select the trigger event (rising edge, falling edge, both) and can be masked independently. A pending register maintains the status of the interrupt requests. The internal lines are connected to peripherals with wakeup from Stop mode capability. The EXTI can detect an external line with a pulse width shorter than the internal clock period. Up to 136 GPIOs can be connected to the 16 external interrupt lines.

## 3.17 Analog to digital converter (ADC)

The device embeds 3 successive approximation analog-to-digital converters with the following features:

- 12-bit native resolution, with built-in calibration
- 5.33 Msps maximum conversion rate with full resolution
  - Down to 18.75 ns sampling time
  - Increased conversion rate for lower resolution (up to 8.88 Msps for 6-bit resolution)
- Up to 24 external channels, some of them shared between ADC1 and ADC2, or ADC1, ADC2 and ADC3.
- 5 internal channels: internal reference voltage, temperature sensor, VBAT/3, DAC1\_OUT1 and DAC1\_OUT2.
- One external reference pin is available on some package, allowing the input voltage range to be independent from the power supply
- Single-ended and differential mode inputs
- Low-power design
  - Capable of low-current operation at low conversion rate (consumption decreases linearly with speed)
  - Dual clock domain architecture: ADC speed independent from CPU frequency
- Highly versatile digital interface
  - Single-shot or continuous/discontinuous sequencer-based scan mode: 2 groups of analog signals conversions can be programmed to differentiate background and high-priority real-time conversions
  - Handles two ADC converters for dual mode operation (simultaneous or interleaved sampling modes)
  - Each ADC support multiple trigger inputs for synchronization with on-chip timers and external signals
  - Results stored into 3 data register or in RAM with DMA controller support
  - Data pre-processing: left/right alignment and per channel offset compensation
  - Built-in oversampling unit for enhanced SNR
  - Channel-wise programmable sampling time
  - Three analog watchdog for automatic voltage monitoring, generating interrupts and trigger for selected timers
  - Hardware assistant to prepare the context of the injected channels to allow fast context switching

### 3.17.1 Temperature sensor

The temperature sensor (TS) generates a voltage  $V_{TS}$  that varies linearly with temperature.

The temperature sensor is internally connected to the ADC1\_IN17 and ADC3\_IN17 input channels which is used to convert the sensor output voltage into a digital value.

The sensor provides good linearity but it has to be calibrated to obtain good overall accuracy of the temperature measurement. As the offset of the temperature sensor varies from chip to chip due to process variation, the uncalibrated internal temperature sensor is suitable for applications that detect temperature changes only.

To improve the accuracy of the temperature sensor measurement, each device is individually factory-calibrated by ST. The temperature sensor factory calibration data are stored by ST in the system memory area, accessible in read-only mode.

**Table 8. Temperature sensor calibration values**

Calibration value name	Description	Memory address
TS_CAL1	TS ADC raw data acquired at a temperature of 30 °C ( $\pm 5$ °C), $V_{DDA} = V_{REF+} = 3.0$ V ( $\pm 10$ mV)	0x1FFF 75A8 - 0x1FFF 75A9
TS_CAL2	TS ADC raw data acquired at a temperature of 130 °C ( $\pm 5$ °C), $V_{DDA} = V_{REF+} = 3.0$ V ( $\pm 10$ mV)	0x1FFF 75CA - 0x1FFF 75CB

### 3.17.2 Internal voltage reference ( $V_{REFINT}$ )

The internal voltage reference ( $V_{REFINT}$ ) provides a stable (bandgap) voltage output for the ADC and Comparators.  $V_{REFINT}$  is internally connected to the ADC1\_IN0 input channel. The precise voltage of  $V_{REFINT}$  is individually measured for each part by ST during production test and stored in the system memory area. It is accessible in read-only mode.

**Table 9. Internal voltage reference calibration values**

Calibration value name	Description	Memory address
VREFINT	Raw data acquired at a temperature of 30 °C ( $\pm 5$ °C), $V_{DDA} = V_{REF+} = 3.0$ V ( $\pm 10$ mV)	0x1FFF 75AA - 0x1FFF 75AB

### 3.17.3 $V_{BAT}$ battery voltage monitoring

This embedded hardware feature allows the application to measure the  $V_{BAT}$  battery voltage using the internal ADC channel ADC1\_IN18 or ADC3\_IN18. As the  $V_{BAT}$  voltage may be higher than  $V_{DDA}$ , and thus outside the ADC input range, the VBAT pin is internally connected to a bridge divider by 3. As a consequence, the converted digital value is one third the  $V_{BAT}$  voltage.

## 3.18 Digital to analog converter (DAC)

Two 12-bit buffered DAC channels can be used to convert digital signals into analog voltage signal outputs. The chosen design structure is composed of integrated resistor strings and an amplifier in inverting configuration.

This digital interface supports the following features:

- Up to two DAC output channels
- 8-bit or 12-bit output mode
- Buffer offset calibration (factory and user trimming)
- Left or right data alignment in 12-bit mode
- Synchronized update capability
- Noise-wave generation
- Triangular-wave generation
- Dual DAC channel independent or simultaneous conversions
- DMA capability for each channel
- External triggers for conversion
- Sample and hold low-power mode, with internal or external capacitor

The DAC channels are triggered through the timer update outputs that are also connected to different DMA channels.

### 3.19 Voltage reference buffer (VREFBUF)

The STM32L4A6xG devices embed an voltage reference buffer which can be used as voltage reference for ADCs, DAC and also as voltage reference for external components through the VREF+ pin.

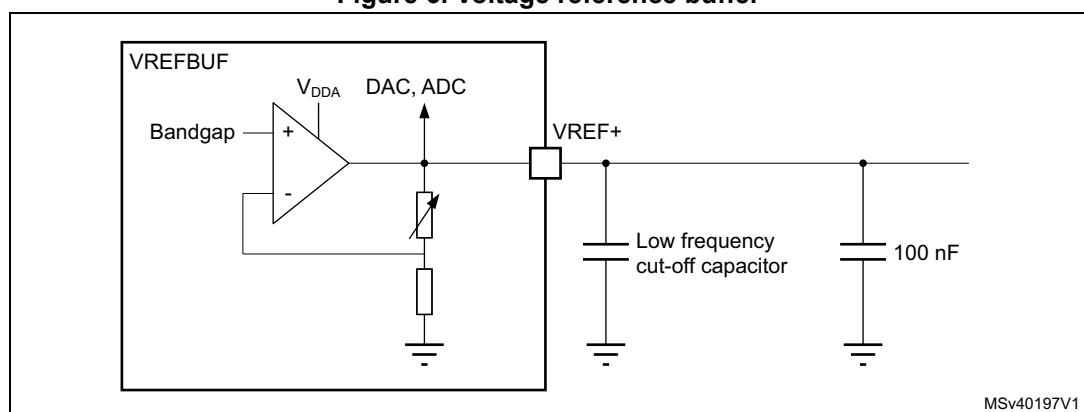

The internal voltage reference buffer supports two voltages:

- 2.048 V
- 2.5 V

An external voltage reference can be provided through the VREF+ pin when the internal voltage reference buffer is off.

The VREF+ pin is double-bonded with VDDA on some packages. In these packages the internal voltage reference buffer is not available.

Figure 6. Voltage reference buffer

### 3.20 Comparators (COMP)

The STM32L4A6xG devices embed two rail-to-rail comparators with programmable reference voltage (internal or external), hysteresis and speed (low speed for low-power) and with selectable output polarity.

The reference voltage can be one of the following:

- External I/O
- DAC output channels
- Internal reference voltage or submultiple (1/4, 1/2, 3/4).

All comparators can wake up from Stop mode, generate interrupts and breaks for the timers and can be also combined into a window comparator.

### 3.21 Operational amplifier (OPAMP)

The STM32L4A6xG embeds two operational amplifiers with external or internal follower routing and PGA capability.

The operational amplifier features:

- Low input bias current
- Low offset voltage
- Low-power mode
- Rail-to-rail input

### 3.22 Touch sensing controller (TSC)

The touch sensing controller provides a simple solution for adding capacitive sensing functionality to any application. Capacitive sensing technology is able to detect finger presence near an electrode which is protected from direct touch by a dielectric (such as glass or plastic). The capacitive variation introduced by the finger (or any conductive object) is measured using a proven implementation based on a surface charge transfer acquisition principle.

The touch sensing controller is fully supported by the STMTouch touch sensing firmware library which is free to use and allows touch sensing functionality to be implemented reliably in the end application.

The main features of the touch sensing controller are the following:

- Proven and robust surface charge transfer acquisition principle
- Supports up to 24 capacitive sensing channels
- Up to 3 capacitive sensing channels can be acquired in parallel offering a very good response time
- Spread spectrum feature to improve system robustness in noisy environments
- Full hardware management of the charge transfer acquisition sequence
- Programmable charge transfer frequency
- Programmable sampling capacitor I/O pin
- Programmable channel I/O pin
- Programmable max count value to avoid long acquisition when a channel is faulty
- Dedicated end of acquisition and max count error flags with interrupt capability
- One sampling capacitor for up to 3 capacitive sensing channels to reduce the system components
- Compatible with proximity, touchkey, linear and rotary touch sensor implementation
- Designed to operate with STMTouch touch sensing firmware library

*Note:* The number of capacitive sensing channels is dependent on the size of the packages and subject to I/O availability.

### 3.23 Liquid crystal display controller (LCD)

The LCD drives up to 8 common terminals and 44 segment terminals to drive up to 320 pixels.

- Internal step-up converter to guarantee functionality and contrast control irrespective of  $V_{DD}$ . This converter can be deactivated, in which case the VLCD pin is used to provide the voltage to the LCD
- Supports static, 1/2, 1/3, 1/4 and 1/8 duty
- Supports static, 1/2, 1/3 and 1/4 bias
- Phase inversion to reduce power consumption and EMI
- Integrated voltage output buffers for higher LCD driving capability
- Up to 8 pixels can be programmed to blink
- Unneeded segments and common pins can be used as general I/O pins
- LCD RAM can be updated at any time owing to a double-buffer
- The LCD controller can operate in Stop mode

### 3.24 Digital filter for Sigma-Delta modulators (DFSDM)

The device embeds one DFSDM with 4 digital filters modules and 8 external input serial channels (transceivers) or alternately 8 internal parallel inputs support.

The DFSDM peripheral is dedicated to interface the external  $\Sigma\Delta$  modulators to microcontroller and then to perform digital filtering of the received data streams (which represent analog value on  $\Sigma\Delta$  modulators inputs). DFSDM can also interface PDM (Pulse Density Modulation) microphones and perform PDM to PCM conversion and filtering in

hardware. DFSDM features optional parallel data stream inputs from microcontrollers memory (through DMA/CPU transfers into DFSDM or from internal ADCs).

DFSDM transceivers support several serial interface formats (to support various  $\Sigma\Delta$  modulators). DFSDM digital filter modules perform digital processing according user selected filter parameters with up to 24-bit final ADC resolution.

The DFSDM peripheral supports:

- 8 multiplexed input digital serial channels:
  - configurable SPI interface to connect various SD modulator(s)
  - configurable Manchester coded 1 wire interface support
  - PDM (Pulse Density Modulation) microphone input support
  - maximum input clock frequency up to 20 MHz (10 MHz for Manchester coding)
  - clock output for SD modulator(s): 0..20 MHz
- alternative inputs from 8 internal digital parallel channels (up to 16 bit input resolution):
  - internal sources: ADCs data or device memory data streams (DMA)
- 4 digital filter modules with adjustable digital signal processing:
  - Sinc<sup>X</sup> filter: filter order/type (1..5), oversampling ratio (up to 1..1024)
  - integrator: oversampling ratio (1..256)
- up to 24-bit output data resolution, signed output data format
- automatic data offset correction (offset stored in register by user)
- continuous or single conversion
- start-of-conversion triggered by:
  - software trigger
  - internal timers
  - external events
  - start-of-conversion synchronously with first digital filter module (DFSDM1\_FLT0)
- analog watchdog feature:
  - low value and high value data threshold registers
  - dedicated configurable Sincx digital filter (order = 1..3, oversampling ratio = 1..32)
  - input from final output data or from selected input digital serial channels
  - continuous monitoring independently from standard conversion
- short circuit detector to detect saturated analog input values (bottom and top range):
  - up to 8-bit counter to detect 1..256 consecutive 0's or 1's on serial data stream
  - monitoring continuously each input serial channel
- break signal generation on analog watchdog event or on short circuit detector event
- extremes detector:
  - storage of minimum and maximum values of final conversion data
  - refreshed by software
- DMA capability to read the final conversion data
- interrupts: end of conversion, overrun, analog watchdog, short circuit, input serial channel clock absence
- “regular” or “injected” conversions:
  - “regular” conversions can be requested at any time or even in continuous mode

- without having any impact on the timing of “injected” conversions
- “injected” conversions for precise timing and with high conversion priority

### 3.25 True random number generator (RNG)

The RNG is a true random number generator that provides full entropy outputs to the application as 32-bit samples. It is composed of a live entropy source (analog) and an internal conditioning component.

### 3.26 Digital camera interface (DCMI)

The devices embed a camera interface that can connect with camera modules and CMOS sensors through an 8-bit to 14-bit parallel interface, to receive video data. The camera interface can sustain a data transfer rate up to 54 Mbyte/s at 54 MHz. It features:

- Programmable polarity for the input pixel clock and synchronization signals
- Parallel data communication can be 8-, 10-, 12- or 14-bit
- Supports 8-bit progressive video monochrome or raw bayer format, YCbCr 4:2:2 progressive video, RGB 565 progressive video or compressed data (like JPEG)
- Supports continuous mode or snapshot (a single frame) mode
- Capability to automatically crop the image

### 3.27 Advanced encryption standard hardware accelerator (AES)

The devices embed an AES hardware accelerator can be used to both encipher and decipher data using AES algorithm.

The AES peripheral supports:

- Encryption/Decryption using AES Rijndael Block Cipher algorithm
- NIST FIPS 197 compliant implementation of AES encryption/decryption algorithm
- 128-bit and 256-bit register for storing the encryption, decryption or derivation key (4x 32-bit registers)
- Electronic codebook (ECB), Cipher block chaining (CBC), Counter mode (CTR), Galois Counter Mode (GCM), Galois Message Authentication Code mode (GMAC) and Cipher Message Authentication Code mode (CMAC) supported.
- Key scheduler
- Key derivation for decryption
- 128-bit data block processing
- 128-bit, 256-bit key length
- 1x32-bit INPUT buffer and 1x32-bit OUTPUT buffer.
- Register access supporting 32-bit data width only.
- One 128-bit Register for the initialization vector when AES is configured in CBC mode or for the 32-bit counter initialization when CTR mode is selected, GCM mode or CMAC mode.
- Automatic data flow control with support of direct memory access (DMA) using 2

channels, one for incoming data, and one for outgoing data.

- Suspend a message if another message with a higher priority needs to be processed

### 3.28 HASH hardware accelerator (HASH)

The hash processor is a fully compliant implementation of the secure hash algorithm (SHA-1, SHA-224, SHA-256), the MD5 (message-digest algorithm 5) hash algorithm and the HMAC (keyed-hash message authentication code) algorithm suitable for a variety of applications.

It computes a message digest (160 bits for the SHA-1 algorithm, 256 bits for the SHA-256 algorithm and 224 bits for the SHA-224 algorithm, 128 bits for the MD5 algorithm) for messages of up to (264 - 1) bits, while HMAC algorithms provide a way of authenticating messages by means of hash functions. HMAC algorithms consist in calling the SHA-1, SHA-224, SHA-256 or MD5 hash function twice.

### 3.29 Timers and watchdogs

The STM32L4A6xG includes two advanced control timers, up to nine general-purpose timers, two basic timers, two low-power timers, two watchdog timers and a SysTick timer. The table below compares the features of the advanced control, general purpose and basic timers.

**Table 10. Timer feature comparison**

Timer type	Timer	Counter resolution	Counter type	Prescaler factor	DMA request generation	Capture/compare channels	Complementary outputs
Advanced control	TIM1, TIM8	16-bit	Up, down, Up/down	Any integer between 1 and 65536	Yes	4	3
General-purpose	TIM2, TIM5	32-bit	Up, down, Up/down	Any integer between 1 and 65536	Yes	4	No
General-purpose	TIM3, TIM4	16-bit	Up, down, Up/down	Any integer between 1 and 65536	Yes	4	No
General-purpose	TIM15	16-bit	Up	Any integer between 1 and 65536	Yes	2	1
General-purpose	TIM16, TIM17	16-bit	Up	Any integer between 1 and 65536	Yes	1	1
Basic	TIM6, TIM7	16-bit	Up	Any integer between 1 and 65536	Yes	0	No

### 3.29.1 Advanced-control timer (TIM1, TIM8)

The advanced-control timer can each be seen as a three-phase PWM multiplexed on 6 channels. They have complementary PWM outputs with programmable inserted dead-times. They can also be seen as complete general-purpose timers. The 4 independent channels can be used for:

- Input capture
- Output compare
- PWM generation (edge or center-aligned modes) with full modulation capability (0-100%)
- One-pulse mode output

In debug mode, the advanced-control timer counter can be frozen and the PWM outputs disabled to turn off any power switches driven by these outputs.

Many features are shared with those of the general-purpose TIMx timers (described in [Section 3.29.2](#)) using the same architecture, so the advanced-control timers can work together with the TIMx timers via the Timer Link feature for synchronization or event chaining.

### 3.29.2 General-purpose timers (TIM2, TIM3, TIM4, TIM5, TIM15, TIM16, TIM17)

There are up to seven synchronizable general-purpose timers embedded in the STM32L4A6xG (see [Table 10](#) for differences). Each general-purpose timer can be used to generate PWM outputs, or act as a simple time base.

- TIM2, TIM3, TIM4 and TIM5

They are full-featured general-purpose timers:

- TIM2 and TIM5 have a 32-bit auto-reload up/downcounter and 32-bit prescaler
- TIM3 and TIM4 have 16-bit auto-reload up/downcounter and 16-bit prescaler.

These timers feature 4 independent channels for input capture/output compare, PWM or one-pulse mode output. They can work together, or with the other general-purpose timers via the Timer Link feature for synchronization or event chaining.

The counters can be frozen in debug mode.

All have independent DMA request generation and support quadrature encoders.

- TIM15, 16 and 17

They are general-purpose timers with mid-range features:

They have 16-bit auto-reload upcounters and 16-bit prescalers.

- TIM15 has 2 channels and 1 complementary channel
- TIM16 and TIM17 have 1 channel and 1 complementary channel

All channels can be used for input capture/output compare, PWM or one-pulse mode output.

The timers can work together via the Timer Link feature for synchronization or event chaining. The timers have independent DMA request generation.

The counters can be frozen in debug mode.

### 3.29.3 Basic timers (TIM6 and TIM7)

The basic timers are mainly used for DAC trigger generation. They can also be used as generic 16-bit timebases.

### 3.29.4 Low-power timer (LPTIM1 and LPTIM2)

The devices embed two low-power timers. These timers have an independent clock and are running in Stop mode if they are clocked by LSE, LSI or an external clock. They are able to wakeup the system from Stop mode.

LPTIM1 is active in Stop 0, Stop 1 and Stop 2 modes.

LPTIM2 is active in Stop 0 and Stop 1 mode.

This low-power timer supports the following features:

- 16-bit up counter with 16-bit autoreload register
- 16-bit compare register
- Configurable output: pulse, PWM
- Continuous/ one shot mode
- Selectable software/hardware input trigger
- Selectable clock source
  - Internal clock sources: LSE, LSI, HSI16 or APB clock
  - External clock source over LPTIM input (working even with no internal clock source running, used by pulse counter application).
- Programmable digital glitch filter
- Encoder mode (LPTIM1 only)

### 3.29.5 Infrared interface (IRTIM)

The STM32L4A6xG includes one infrared interface (IRTIM), which can be used with an infrared LED to perform remote control functions. It uses TIM16 and TIM17 output channels to generate output signal waveforms on IR\_OUT pin.

### 3.29.6 Independent watchdog (IWDG)

The independent watchdog is based on a 12-bit downcounter and 8-bit prescaler. It is clocked from an independent 32 kHz internal RC (LSI) and as it operates independently from the main clock, it can operate in Stop and Standby modes. It can be used either as a watchdog to reset the device when a problem occurs, or as a free running timer for application timeout management. It is hardware or software configurable through the option bytes. The counter can be frozen in debug mode.

### 3.29.7 System window watchdog (WWDG)

The window watchdog is based on a 7-bit downcounter that can be set as free running. It can be used as a watchdog to reset the device when a problem occurs. It is clocked from the main clock. It has an early warning interrupt capability and the counter can be frozen in debug mode.

### 3.29.8 SysTick timer

This timer is dedicated to real-time operating systems, but can also be used as a standard down counter. It features:

- A 24-bit down counter
- Autoreload capability
- Maskable system interrupt generation when the counter reaches 0
- Programmable clock source

## 3.30 Real-time clock (RTC) and backup registers

The RTC is an independent BCD timer/counter. It supports the following features:

- Calendar with subsecond, seconds, minutes, hours (12 or 24 format), week day, date, month, year, in BCD (binary-coded decimal) format.
- Automatic correction for 28, 29 (leap year), 30, and 31 days of the month.
- Two programmable alarms.
- On-the-fly correction from 1 to 32767 RTC clock pulses. This can be used to synchronize it with a master clock.
- Reference clock detection: a more precise second source clock (50 or 60 Hz) can be used to enhance the calendar precision.
- Digital calibration circuit with 0.95 ppm resolution, to compensate for quartz crystal inaccuracy.
- Three anti-tamper detection pins with programmable filter.
- Timestamp feature, which can be used to save the calendar content. This function can be triggered by an event on the timestamp pin, or by a tamper event, or by a switch to VBAT mode.
- 17-bit auto-reload wakeup timer (WUT) for periodic events with programmable resolution and period.

The RTC and the 32 backup registers are supplied through a switch that takes power either from the  $V_{DD}$  supply when present or from the VBAT pin.

The backup registers are 32-bit registers used to store 128 bytes of user application data when  $V_{DD}$  power is not present. They are not reset by a system or power reset, or when the device wakes up from Standby or Shutdown mode.

The RTC clock sources can be:

- A 32.768 kHz external crystal (LSE)
- An external resonator or oscillator (LSE)
- The internal low power RC oscillator (LSI, with typical frequency of 32 kHz)
- The high-speed external clock (HSE) divided by 32.

The RTC is functional in VBAT mode and in all low-power modes when it is clocked by the LSE. When clocked by the LSI, the RTC is not functional in VBAT mode, but is functional in all low-power modes except Shutdown mode.

All RTC events (Alarm, WakeUp Timer, Timestamp or Tamper) can generate an interrupt and wakeup the device from the low-power modes.

### 3.31 Inter-integrated circuit interface (I<sup>2</sup>C)

The device embeds four I2C. Refer to [Table 11](#) for the features implementation.

The I<sup>2</sup>C bus interface handles communications between the microcontroller and the serial I<sup>2</sup>C bus. It controls all I<sup>2</sup>C bus-specific sequencing, protocol, arbitration and timing.

The I2C peripheral supports:

- I<sup>2</sup>C-bus specification and user manual rev. 5 compatibility:
  - Slave and master modes, multimaster capability
  - Standard-mode (Sm), with a bitrate up to 100 kbit/s
  - Fast-mode (Fm), with a bitrate up to 400 kbit/s
  - Fast-mode Plus (Fm+), with a bitrate up to 1 Mbit/s and 20 mA output drive I/Os
  - 7-bit and 10-bit addressing mode, multiple 7-bit slave addresses
  - Programmable setup and hold times
  - Optional clock stretching
- System Management Bus (SMBus) specification rev 2.0 compatibility:
  - Hardware PEC (Packet Error Checking) generation and verification with ACK control
  - Address resolution protocol (ARP) support
  - SMBus alert
- Power System Management Protocol (PMBus™) specification rev 1.1 compatibility
- Independent clock: a choice of independent clock sources allowing the I2C communication speed to be independent from the PCLK reprogramming. Refer to [Figure 5: Clock tree](#).
- Wakeup from Stop mode on address match
- Programmable analog and digital noise filters
- 1-byte buffer with DMA capability

**Table 11. I2C implementation**

I2C features <sup>(1)</sup>	I2C1	I2C2	I2C3	I2C4
Standard-mode (up to 100 kbit/s)	X	X	X	X
Fast-mode (up to 400 kbit/s)	X	X	X	X
Fast-mode Plus with 20mA output drive I/Os (up to 1 Mbit/s)	X	X	X	X
Programmable analog and digital noise filters	X	X	X	X
SMBus/PMBus hardware support	X	X	X	X
Independent clock	X	X	X	X
Wakeup from Stop0, Stop 1 mode on address match	X	X	X	X
Wakeup from Stop 2 mode on address match	-	-	X	-

1. X: supported

### 3.32 Universal synchronous/asynchronous receiver transmitter (USART)

The STM32L4A6xG devices have three embedded universal synchronous receiver transmitters (USART1, USART2 and USART3) and two universal asynchronous receiver transmitters (UART4, UART5).

These interfaces provide asynchronous communication, IrDA SIR ENDEC support, multiprocessor communication mode, single-wire half-duplex communication mode and have LIN Master/Slave capability. They provide hardware management of the CTS and RTS signals, and RS485 Driver Enable, and are able to communicate at speeds of up to 10 Mbit/s.

USART1, USART2 and USART3 also provide Smart Card mode (ISO 7816 compliant) and SPI-like communication capability.

All USART have a clock domain independent from the CPU clock, allowing the USARTx (x=1,2,3,4,5) to wake up the MCU from Stop mode using baudrates up to 204 Kbaud. The wake up events from Stop mode are programmable and can be:

- Start bit detection
- Any received data frame
- A specific programmed data frame

All USART interfaces can be served by the DMA controller.

**Table 12. STM32L4A6xG USART/UART/LPUART features**

USART modes/features <sup>(1)</sup>	USART1	USART2	USART3	UART4	UART5	LPUART1
Hardware flow control for modem	X	X	X	X	X	X
Continuous communication using DMA	X	X	X	X	X	X
Multiprocessor communication	X	X	X	X	X	X
Synchronous mode	X	X	X	-	-	-
Smartcard mode	X	X	X	-	-	-
Single-wire half-duplex communication	X	X	X	X	X	X
IrDA SIR ENDEC block	X	X	X	X	X	-
LIN mode	X	X	X	X	X	-
Dual clock domain	X	X	X	X	X	X
Wakeup from Stop 0 / Stop 1 modes	X	X	X	X	X	X
Wakeup from Stop 2 mode	-	-	-	-	-	X
Receiver timeout interrupt	X	X	X	X	X	-
Modbus communication	X	X	X	X	X	-
Auto baud rate detection	X (4 modes)					-
Driver Enable	X	X	X	X	X	X
LPUART/USART data length	7, 8 and 9 bits					

1. X = supported.

### 3.33 Low-power universal asynchronous receiver transmitter (LPUART)

The device embeds one Low-Power UART. The LPUART supports asynchronous serial communication with minimum power consumption. It supports half duplex single wire communication and modem operations (CTS/RTS). It allows multiprocessor communication.

The LPUART has a clock domain independent from the CPU clock, and can wakeup the system from Stop mode using baudrates up to 220 Kbaud. The wake up events from Stop mode are programmable and can be:

- Start bit detection
- Any received data frame
- A specific programmed data frame

Only a 32.768 kHz clock (LSE) is needed to allow LPUART communication up to 9600 baud. Therefore, even in Stop mode, the LPUART can wait for an incoming frame while having an extremely low energy consumption. Higher speed clock can be used to reach higher baudrates.

LPUART interface can be served by the DMA controller.

### 3.34 Serial peripheral interface (SPI)

Three SPI interfaces allow communication up to 40 Mbits/s in master and slave modes, in half-duplex, full-duplex and simplex modes. The 3-bit prescaler gives 8 master mode frequencies and the frame size is configurable from 4 bits to 16 bits. The SPI interfaces support NSS pulse mode, TI mode and Hardware CRC calculation.

All SPI interfaces can be served by the DMA controller.

### 3.35 Serial audio interfaces (SAI)

The device embeds 2 SAI. Refer to [Table 13](#) for the features implementation. The SAI bus interface handles communications between the microcontroller and the serial audio protocol.

The SAI peripheral supports:

- Two independent audio sub-blocks which can be transmitters or receivers with their respective FIFO.
- 8-word integrated FIFOs for each audio sub-block.
- Synchronous or asynchronous mode between the audio sub-blocks.
- Master or slave configuration independent for both audio sub-blocks.
- Clock generator for each audio block to target independent audio frequency sampling when both audio sub-blocks are configured in master mode.
- Data size configurable: 8-, 10-, 16-, 20-, 24-, 32-bit.
- Peripheral with large configurability and flexibility permitting to target as example the following audio protocol: I2S, LSB or MSB-justified, PCM/DSP, TDM, AC'97 and SPDIF out.
- Up to 16 slots available with configurable size and with the possibility to select which ones are active in the audio frame.
- Number of bits by frame may be configurable.
- Frame synchronization active level configurable (offset, bit length, level).
- First active bit position in the slot is configurable.
- LSB first or MSB first for data transfer.
- Mute mode.
- Stereo/Mono audio frame capability.
- Communication clock strobing edge configurable (SCK).
- Error flags with associated interrupts if enabled respectively.
  - Overrun and underrun detection.
  - Anticipated frame synchronization signal detection in slave mode.
  - Late frame synchronization signal detection in slave mode.
  - Codec not ready for the AC'97 mode in reception.
- Interruption sources when enabled:
  - Errors.
  - FIFO requests.
- DMA interface with 2 dedicated channels to handle access to the dedicated integrated FIFO of each SAI audio sub-block.

Table 13. SAI implementation

SAI features <sup>(1)</sup>	SAI1	SAI2
I2S, LSB or MSB-justified, PCM/DSP, TDM, AC'97	X	X
Mute mode	X	X
Stereo/Mono audio frame capability.	X	X
16 slots	X	X
Data size configurable: 8-, 10-, 16-, 20-, 24-, 32-bit	X	X
FIFO size	X (8 words)	X (8 words)
SPDIF	X	X

1. X: supported

### 3.36 Single wire protocol master interface (SWPMI)

The Single wire protocol master interface (SWPMI) is the master interface corresponding to the Contactless Frontend (CLF) defined in the ETSI TS 102 613 technical specification. The main features are:

- full-duplex communication mode
- automatic SWP bus state management (active, suspend, resume)
- configurable bitrate up to 2 Mbit/s
- automatic SOF, EOF and CRC handling

SWPMI can be served by the DMA controller.

### 3.37 Controller area network (CAN)

The two CANs are compliant with the 2.0A and B (active) specifications with a bitrate up to 1Mbit/s. They can receive and transmit standard frames with 11-bit identifiers as well as extended frames with 29-bit identifiers. Each CAN has three transmit mailboxes, two receive FIFOS with 3 stages and 28 shared scalable filter banks (all of them can be used even if one CAN is used). 256 bytes of SRAM are allocated for each CAN.

Dual CAN peripheral configuration is available. The CAN peripheral supports:

- Supports CAN protocol version 2.0 A, B Active
- Bit rates up to 1 Mbit/s
- Transmission
  - Three transmit mailboxes
  - Configurable transmit priority
- Reception
  - Two receive FIFOs with three stages
  - Scalable filter banks: 28 filter banks shared between CAN1 and CAN2
  - Identifier list feature
  - Configurable FIFO overrun
- Time-triggered communication option
  - Disable automatic retransmission mode
  - 16-bit free running timer
  - Time Stamp sent in last two data bytes
- Management
  - Maskable interrupts
  - Software-efficient mailbox mapping at a unique address space

### 3.38 Secure digital input/output and MultiMediaCards interface (SDMMC)

The card host interface (SDMMC) provides an interface between the APB peripheral bus and MultiMediaCards (MMCs), SD memory cards and SDIO cards.

The SDMMC features include the following:

- Full compliance with MultiMediaCard System Specification Version 4.2. Card support for three different databus modes: 1-bit (default), 4-bit and 8-bit
- Full compatibility with previous versions of MultiMediaCards (forward compatibility)
- Full compliance with SD Memory Card Specifications Version 2.0
- Full compliance with SD I/O Card Specification Version 2.0: card support for two different databus modes: 1-bit (default) and 4-bit
- Data transfer up to 48 MHz for the 8 bit mode
- Data write and read with DMA capability

### 3.39 Universal serial bus on-the-go full-speed (OTG\_FS)

The devices embed an USB OTG full-speed device/host/OTG peripheral with integrated transceivers. The USB OTG FS peripheral is compliant with the USB 2.0 specification and with the OTG 2.0 specification. It has software-configurable endpoint setting and supports suspend/resume. The USB OTG controller requires a dedicated 48 MHz clock that can be provided by the internal multispeed oscillator (MSI) automatically trimmed by 32.768 kHz external oscillator (LSE). This permits to use the USB device without external high speed crystal (HSE).

The synchronization for this oscillator can also be taken from the USB data stream itself (SOF signalization) which allows crystal less operation.

The major features are:

- Combined Rx and Tx FIFO size of 1.25 KB with dynamic FIFO sizing
- Supports the session request protocol (SRP) and host negotiation protocol (HNP)
- 1 bidirectional control endpoint + 5 IN endpoints + 5 OUT endpoints
- 12 host channels with periodic OUT support
- HNP/SNP/IP inside (no need for any external resistor)
- USB 2.0 LPM (Link Power Management) support
- Battery Charging Specification Revision 1.2 support
- Internal FS OTG PHY support

For OTG/Host modes, a power switch is needed in case bus-powered devices are connected.

### 3.40 Clock recovery system (CRS)

The STM32L4A6xG devices embed a special block which allows automatic trimming of the internal 48 MHz oscillator to guarantee its optimal accuracy over the whole device operational range. This automatic trimming is based on the external synchronization signal, which could be either derived from USB SOF signalization, from LSE oscillator, from an external signal on CRS\_SYNC pin or generated by user software. For faster lock-in during startup it is also possible to combine automatic trimming with manual trimming action.

### 3.41 Flexible static memory controller (FSMC)

The Flexible static memory controller (FSMC) includes two memory controllers:

- The NOR/PSRAM memory controller
- The NAND/memory controller

This memory controller is also named Flexible memory controller (FMC).

The main features of the FMC controller are the following:

- Interface with static-memory mapped devices including:
  - Static random access memory (SRAM)
  - NOR Flash memory/OneNAND Flash memory
  - PSRAM (4 memory banks)
  - NAND Flash memory with ECC hardware to check up to 8 Kbyte of data
- 8-,16- bit data bus width
- Independent Chip Select control for each memory bank
- Independent configuration for each memory bank
- Write FIFO
- The Maximum FMC\_CLK frequency for synchronous accesses is HCLK/2.

### LCD parallel interface

The FMC can be configured to interface seamlessly with most graphic LCD controllers. It supports the Intel 8080 and Motorola 6800 modes, and is flexible enough to adapt to specific LCD interfaces. This LCD parallel interface capability makes it easy to build cost effective graphic applications using LCD modules with embedded controllers or high performance solutions using external controllers with dedicated acceleration.

*For WLCSP100 package, address lines [A18:A16] are missing versus other 100 pin packages, thus FMC provides only 2MB of addressable space, split into 64K blocks. The main usage of the FMC in this case is to drive external LCD interface.*

## 3.42 Dual-flash Quad SPI memory interface (QUADSPI)

The Dual-flash Quad SPI is a specialized communication interface targeting single, dual or quad SPI Flash memories. It can operate in any of the three following modes:

- Indirect mode: all the operations are performed using the QUADSPI registers
- Status polling mode: the external Flash memory status register is periodically read and an interrupt can be generated in case of flag setting
- Memory-mapped mode: the external Flash is memory mapped and is seen by the system as if it were an internal memory

Both throughput and capacity can be increased two-fold using dual-flash mode, where two Quad SPI flash memories are accessed simultaneously.

The Dual-flash Quad SPI interface supports:

- Three functional modes: indirect, status-polling, and memory-mapped
- Dual-flash mode, where 8 bits can be sent/received simultaneously by accessing two flash memories in parallel.
- SDR and DDR support
- Fully programmable opcode for both indirect and memory mapped mode
- Fully programmable frame format for both indirect and memory mapped mode
- Each of the five following phases can be configured independently (enable, length, single/dual/quad communication)
  - Instruction phase
  - Address phase
  - Alternate bytes phase
  - Dummy cycles phase
  - Data phase
- Integrated FIFO for reception and transmission
- 8, 16, and 32-bit data accesses are allowed
- DMA channel for indirect mode operations
- Programmable masking for external flash flag management
- Timeout management
- Interrupt generation on FIFO threshold, timeout, status match, operation complete, and access error

## 3.43 Development support

### 3.43.1 Serial wire JTAG debug port (SWJ-DP)

The Arm® SWJ-DP interface is embedded, and is a combined JTAG and serial wire debug port that enables either a serial wire debug or a JTAG probe to be connected to the target.

Debug is performed using only two pins instead of the five required by the JTAG (JTAG pins can be reused as GPIO with alternate function): the JTAG TMS and TCK pins are shared with SWDIO and SWCLK, respectively, and a specific sequence on the TMS pin is used to switch between JTAG-DP and SW-DP.

### 3.43.2 Embedded Trace Macrocell™

The Arm® Embedded Trace Macrocell™ provides a greater visibility of the instruction and data flow inside the CPU core by streaming compressed data at a very high rate from the STM32L4A6xG through a small number of ETM pins to an external hardware trace port analyzer (TPA) device. Real-time instruction and data flow activity be recorded and then formatted for display on the host computer that runs the debugger software. TPA hardware is commercially available from common development tool vendors.

The Embedded Trace Macrocell™ operates with third party debugger software tools.

**Table 14. Legend/abbreviations used in the pinout table**

Name		Abbreviation	Definition
Pin name		Unless otherwise specified in brackets below the pin name, the pin function during and after reset is the same as the actual pin name	
Pin type	S		Supply pin
	I		Input only pin
	I/O		Input / output pin
I/O structure	FT		5 V tolerant I/O
	TT		3.6 V tolerant I/O
	RST		Bidirectional reset pin with embedded weak pull-up resistor
	<b>Option for TT or FT I/Os</b>		
	_f <sup>(1)</sup>		I/O, Fm+ capable
	_l <sup>(2)</sup>		I/O, with LCD function supplied by V <sub>LCD</sub>
	_u <sup>(3)</sup>		I/O, with USB function supplied by V <sub>DDUSB</sub>
	_a <sup>(4)</sup>		I/O, with Analog switch function supplied by V <sub>DDA</sub>
_s <sup>(5)</sup>		I/O supplied only by V <sub>DDIO2</sub>	
Notes		Unless otherwise specified by a note, all I/Os are set as analog inputs during and after reset.	
Pin functions	Alternate functions	Functions selected through GPIOx_AFR registers	
	Additional functions	Functions directly selected/enabled through peripheral registers	

1. The related I/O structures in [Table 15](#) are: FT\_f, FT\_fa, FT\_fl, FT fla.
2. The related I/O structures in [Table 15](#) are: FT\_l, FT\_fl, FT\_lu.
3. The related I/O structures in [Table 15](#) are: FT\_u, FT\_lu.
4. The related I/O structures in [Table 15](#) are: FT\_a, FT\_la, FT\_fa, FT fla, TT\_a, TT\_la.
5. The related I/O structures in [Table 15](#) are: FT\_s, FT\_fs.

**Note:** *FT\_a and FT\_fa pins can be connected to analog peripherals inputs. When analog peripheral is not connected to this FT\_a or FT\_fa pins (analog switch from GPIO to peripheral is not closed, for example ADC not uses given pin as ADC input), then GPIO can accept V<sub>DD</sub> + 3.6 V (5 V tolerant I/O). However, once the I/O input is connected to the analog peripheral (for example ADC selects as input channel from this pin), the parasitic diode from this I/O pin to V<sub>DDA</sub> and/or V<sub>REF+</sub> does not allow to use higher voltage on given I/O pin than V<sub>DDA</sub> or V<sub>REF+</sub> and pin is no more 5 V-tolerant I/O.*

1. PC13, PC14 and PC15 are supplied through the power switch. Since the switch only sinks a limited amount of current(3 mA), the u mode is limited:
  - The speed should not exceed 2 MHz with a maximum load of 30 pF.
  - These GPIOs must not be used as current sources (e.g. to drive an LED).
2. After a Backup domain power-up, PC13, PC14 and PC15 operate as GPIOs. Their function then depends on the content of the RTC system reset. For details on how to manage these GPIOs, refer to the Backup domain and RTC register descriptions in the RM035
3. OPAMPx\_VINM pins are not available as additional functions on pins PA1 and PA7 on UFBGA packages. On UFBGA packages, us available on M3 and M4 balls.
4. After reset, these pins are configured as JTAG/SW debug alternate functions, and the internal pull-up on PA15, PA13, PB4 pins and activated.

## 6 Electrical characteristics

### 6.1 Parameter conditions

Unless otherwise specified, all voltages are referenced to  $V_{SS}$ .

#### 6.1.1 Minimum and maximum values

Unless otherwise specified, the minimum and maximum values are guaranteed in the worst conditions of ambient temperature, supply voltage and frequencies by tests in production on 100% of the devices with an ambient temperature at  $T_A = 25\text{ °C}$  and  $T_A = T_{Amax}$  (given by the selected temperature range).

Data based on characterization results, design simulation and/or technology characteristics are indicated in the table footnotes and are not tested in production. Based on characterization, the minimum and maximum values refer to sample tests and represent the mean value plus or minus three times the standard deviation (mean  $\pm 3\sigma$ ).

#### 6.1.2 Typical values

Unless otherwise specified, typical data are based on  $T_A = 25\text{ °C}$ ,  $V_{DD} = V_{DDA} = 3\text{ V}$ . They are given only as design guidelines and are not tested.

Typical ADC accuracy values are determined by characterization of a batch of samples from a standard diffusion lot over the full temperature range, where 95% of the devices have an error less than or equal to the value indicated (mean  $\pm 2\sigma$ ).

#### 6.1.3 Typical curves

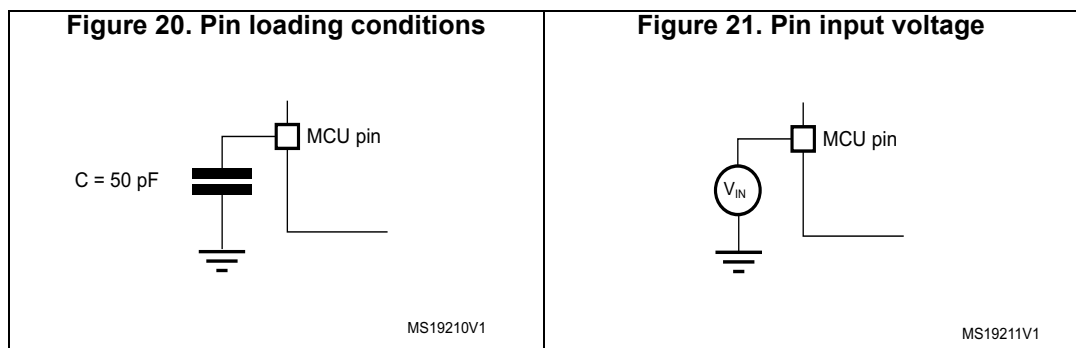

Unless otherwise specified, all typical curves are given only as design guidelines and are not tested.

#### 6.1.4 Loading capacitor

The loading conditions used for pin parameter measurement are shown in [Figure 20](#).

#### 6.1.5 Pin input voltage

The input voltage measurement on a pin of the device is described in [Figure 21](#).

6.1.6 Power supply scheme

Figure 22. Power supply scheme

MS35001V3

**Caution:** Each power supply pair ( $V_{DD}/V_{SS}$ ,  $V_{DDA}/V_{SSA}$  etc.) must be decoupled with filtering ceramic capacitors as shown above. These capacitors must be placed as close as possible to or below the appropriate pins on the underside of the PCB to ensure the good functionality of the device.

### 6.1.7 Current consumption measurement

Figure 23. Current consumption measurement scheme with and without external SMPS power supply

The  $I_{DD\_ALL}$  parameters given in [Table 26](#) to [Table 48](#) represent the total MCU consumption including the current supplying  $V_{DD}$ ,  $V_{DDIO2}$ ,  $V_{DDA}$ ,  $V_{DDUSB}$  and  $V_{BAT}$ .

## 6.2 Absolute maximum ratings

Stresses above the absolute maximum ratings listed in [Table 19](#), [Table 20](#) and [Table 21](#) may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these conditions is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability. The device mission profile (application conditions) is compliant with JEDEC JESD47 qualification standard, extended mission profiles are available on demand.

Table 19. Voltage characteristics<sup>(1)</sup>

Symbol	Ratings	Min	Max	Unit
$V_{DDX} - V_{SS}$	External main supply voltage (including $V_{DD}$ , $V_{DDA}$ , $V_{DDIO2}$ , $V_{DDUSB}$ , $V_{LCD}$ , $V_{BAT}$ )	-0.3	4.0	V
$V_{DD12} - V_{SS}$	External SMPS supply voltage	Range 1	1.4	
		Range 2		
$V_{IN}^{(2)}$	Input voltage on FT_XXX pins	$V_{SS}-0.3$	$\min(V_{DD}, V_{DDA}, V_{DDIO2}, V_{DDUSB}, V_{LCD}) + 4.0^{(3)(4)}$	
	Input voltage on TT_xx pins	$V_{SS}-0.3$	4.0	
	Input voltage on BOOT0 pin	$V_{SS}$	9.0	
	Input voltage on any other pins	$V_{SS}-0.3$	4.0	

**Table 19. Voltage characteristics<sup>(1)</sup> (continued)**

Symbol	Ratings	Min	Max	Unit
$ \Delta V_{DDx} $	Variations between different $V_{DDx}$ power pins of the same domain	-	50	mV
$ V_{SSx}-V_{SS} $	Variations between all the different ground pins <sup>(5)</sup>	-	50	mV
$V_{DDx}-V_{SS}$	External main supply voltage (including $V_{DD}$ , $V_{DDA}$ , $V_{DDIO2}$ , $V_{DDUSB}$ , $V_{LCD}$ , $V_{BAT}$ , $V_{REF+}$ )	-0.3	4.0	V
$V_{REF+} - V_{DDA}$	Allowed voltage difference for $V_{REF+} > V_{DDA}$	-	0.4	V

1. All main power ( $V_{DD}$ ,  $V_{DDA}$ ,  $V_{DDIO2}$ ,  $V_{DDUSB}$ ,  $V_{LCD}$ ,  $V_{BAT}$ ) and ground ( $V_{SS}$ ,  $V_{SSA}$ ) pins must always be connected to the external power supply, in the permitted range.
2.  $V_{IN}$  maximum must always be respected. Refer to [Table 20](#) for the maximum allowed injected current values.
3. This formula has to be applied only on the power supplies related to the IO structure described in the pin definition table.
4. To sustain a voltage higher than 4 V the internal pull-up/pull-down resistors must be disabled.
5. Include VREF- pin.

**Table 20. Current characteristics**

Symbol	Ratings	Max	Unit
$\Sigma I_{V_{DD}}$	Total current into sum of all $V_{DD}$ power lines (source) <sup>(1) (2)</sup>	150	mA
$\Sigma I_{V_{SS}}$	Total current out of sum of all $V_{SS}$ ground lines (sink) <sup>(1)</sup>	150	
$I_{V_{DD}(PIN)}$	Maximum current into each $V_{DD}$ power pin (source) <sup>(1)(2)</sup>	100	
$I_{V_{SS}(PIN)}$	Maximum current out of each $V_{SS}$ ground pin (sink) <sup>(1)</sup>	100	
$I_{IO(PIN)}$	Output current sunk by any I/O and control pin except FT_f	20	
	Output current sunk by any FT_f pin	20	
	Output current sourced by any I/O and control pin	20	
$\Sigma I_{IO(PIN)}$	Total output current sunk by sum of all I/Os and control pins <sup>(3)</sup>	100	
	Total output current sourced by sum of all I/Os and control pins <sup>(3)</sup>	100	
$I_{INJ(PIN)}^{(4)}$	Injected current on FT_xxx, TT_xx, RST and B pins, except PA4, PA5	-5/+0 <sup>(5)</sup>	
	Injected current on PA4, PA5	-5/0	
$\Sigma  I_{INJ(PIN)} $	Total injected current (sum of all I/Os and control pins) <sup>(6)</sup>	25	

1. All main power ( $V_{DD}$ ,  $V_{DDA}$ ,  $V_{DDIO2}$ ,  $V_{DDUSB}$ ,  $V_{LCD}$ ,  $V_{BAT}$ ) and ground ( $V_{SS}$ ,  $V_{SSA}$ ) pins must always be connected to the external power supplies, in the permitted range.
2. Valid also for  $V_{DD12}$  on SMPS package
3. This current consumption must be correctly distributed over all I/Os and control pins. The total output current must not be sunk/sourced between two consecutive power supply pins referring to high pin count QFP packages.
4. Positive injection (when  $V_{IN} > V_{DDIOx}$ ) is not possible on these I/Os and does not occur for input voltages lower than the specified maximum value.
5. A negative injection is induced by  $V_{IN} < V_{SS}$ .  $I_{INJ(PIN)}$  must never be exceeded. Refer to [Table 19](#) for the minimum allowed input voltage values.
6. When several inputs are submitted to a current injection, the maximum  $\Sigma |I_{INJ(PIN)}|$  is the absolute sum of the negative injected currents (instantaneous values).

Table 21. Thermal characteristics

Symbol	Ratings	Value	Unit
T <sub>STG</sub>	Storage temperature range	-65 to +150	°C
T <sub>J</sub>	Maximum junction temperature	150	°C

### 6.3 Operating conditions

#### 6.3.1 General operating conditions

Table 22. General operating conditions

Symbol	Parameter	Conditions	Min	Max	Unit
f <sub>HCLK</sub>	Internal AHB clock frequency	-	0	80	MHz
f <sub>PCLK1</sub>	Internal APB1 clock frequency	-	0	80	
f <sub>PCLK2</sub>	Internal APB2 clock frequency	-	0	80	
V <sub>DD</sub>	Standard operating voltage	-	1.71 (1)	3.6	V
V <sub>DD12</sub>	Standard operating voltage	Full frequency range	1.08	1.32	
		Up to 26 MHz	1.05		
V <sub>DDIO2</sub>	PG[15:2] I/Os supply voltage	At least one I/O in PG[15:2] used	1.08	3.6	
		PG[15:2] not used	0	3.6	
V <sub>DDA</sub>	Analog supply voltage	ADC or COMP used	1.62	3.6	
		DAC or OPAMP used	1.8		
		VREFBUF used	2.4		
		ADC, DAC, OPAMP, COMP, VREFBUF not used	0		
V <sub>BAT</sub>	Backup operating voltage	-	1.55	3.6	
V <sub>DDUSB</sub>	USB supply voltage	USB used	3.0	3.6	
		USB not used	0	3.6	
V <sub>IN</sub>	I/O input voltage	TT_xx I/O	-0.3	V <sub>DDIOx</sub> +0.3	
		BOOT0	0	9	
		All I/O except BOOT0 and TT_xx	-0.3	Min(Min(V <sub>DD</sub> , V <sub>DDA</sub> , V <sub>DDIO2</sub> , V <sub>DDUSB</sub> , V <sub>LCD</sub> )+3.6 V, 5.5 V) <sup>(2)(3)</sup>	

Table 22. General operating conditions (continued)

Symbol	Parameter	Conditions	Min	Max	Unit	
P <sub>D</sub>	Power dissipation at T <sub>A</sub> = 85 °C for suffix 6 <sup>(4)</sup>	LQFP144	-	-	625	mW
		LQFP100	-	-	476	
		LQFP64	-	-	444	
		UFBGA169	-	-	385	
		UFBGA132	-	-	364	
		WLCSP100	-	-	559	
P <sub>D</sub>	Power dissipation at T <sub>A</sub> = 125 °C for suffix 3 <sup>(4)</sup>	LQFP144	-	-	156	mW
		LQFP100	-	-	119	
		LQFP64	-	-	111	
		UFBGA169	-	-	96	
		UFBGA132	-	-	91	
		WLCSP100	-	-	140	
T <sub>A</sub>	Ambient temperature for the suffix 6 version	Maximum power dissipation	-40	85	°C	
		Low-power dissipation <sup>(5)</sup>	-40	105		
	Ambient temperature for the suffix 3 version	Maximum power dissipation	-40	125		
		Low-power dissipation <sup>(5)</sup>	-40	130		
T <sub>J</sub>	Junction temperature range	Suffix 6 version	-40	105	°C	
		Suffix 3 version	-40	130		

1. When RESET is released functionality is guaranteed down to V<sub>BOR0</sub> Min.
2. This formula has to be applied only on the power supplies related to the IO structure described by the pin definition table. Maximum I/O input voltage is the smallest value between Min(V<sub>DD</sub>, V<sub>DDA</sub>, V<sub>DDIO2</sub>, V<sub>DDUSB</sub>, V<sub>LCD</sub>)+3.6 V and 5.5V.
3. For operation with voltage higher than Min (V<sub>DD</sub>, V<sub>DDA</sub>, V<sub>DDIO2</sub>, V<sub>DDUSB</sub>, V<sub>LCD</sub>) +0.3 V, the internal Pull-up and Pull-Down resistors must be disabled.
4. If T<sub>A</sub> is lower, higher P<sub>D</sub> values are allowed as long as T<sub>J</sub> does not exceed T<sub>Jmax</sub> (see [Section 7.7: Thermal characteristics](#)).
5. In low-power dissipation state, T<sub>A</sub> can be extended to this range as long as T<sub>J</sub> does not exceed T<sub>Jmax</sub> (see [Section 7.7: Thermal characteristics](#)).

### 6.3.2 Operating conditions at power-up / power-down

The parameters given in [Table 23](#) are derived from tests performed under the ambient temperature condition summarized in [Table 22](#).

Table 23. Operating conditions at power-up / power-down<sup>(1)</sup>

Symbol	Parameter	Conditions	Min	Max	Unit
t <sub>VDD</sub>	V <sub>DD</sub> rise time rate	-	0	∞	μs/V
	V <sub>DD</sub> fall time rate		10	∞	
t <sub>VDDA</sub>	V <sub>DDA</sub> rise time rate	-	0	∞	μs/V
	V <sub>DDA</sub> fall time rate		10	∞	

Table 23. Operating conditions at power-up / power-down<sup>(1)</sup> (continued)

Symbol	Parameter	Conditions	Min	Max	Unit
$t_{VDDUSB}$	$V_{DDUSB}$ rise time rate	-	0	$\infty$	$\mu\text{s/V}$
	$V_{DDUSB}$ fall time rate		10	$\infty$	
$t_{VDDIO2}$	$V_{DDIO2}$ rise time rate	-	0	$\infty$	$\mu\text{s/V}$
	$V_{DDIO2}$ fall time rate		10	$\infty$	

1. At Power up, the  $V_{DD12}$  voltage should not be forced externally

The requirements for power-up/down sequence specified in [Section 3.10.1: Power supply schemes](#) must be respected.

### 6.3.3 Embedded reset and power control block characteristics

The parameters given in [Table 24](#) are derived from tests performed under the ambient temperature conditions summarized in [Table 22](#).

Table 24. Embedded reset and power control block characteristics

Symbol	Parameter	Conditions <sup>(1)</sup>	Min	Typ	Max	Unit
$t_{RSTTEMPO}$ <sup>(2)</sup>	Reset temporization after BOR0 is detected	$V_{DD}$ rising	-	250	400	$\mu\text{s}$
$V_{BOR0}$ <sup>(2)</sup>	Brown-out reset threshold 0	Rising edge	1.62	1.66	1.7	V
		Falling edge	1.6	1.64	1.69	
$V_{BOR1}$	Brown-out reset threshold 1	Rising edge	2.06	2.1	2.14	V
		Falling edge	1.96	2	2.04	
$V_{BOR2}$	Brown-out reset threshold 2	Rising edge	2.26	2.31	2.35	V
		Falling edge	2.16	2.20	2.24	
$V_{BOR3}$	Brown-out reset threshold 3	Rising edge	2.56	2.61	2.66	V
		Falling edge	2.47	2.52	2.57	
$V_{BOR4}$	Brown-out reset threshold 4	Rising edge	2.85	2.90	2.95	V
		Falling edge	2.76	2.81	2.86	
$V_{PVD0}$	Programmable voltage detector threshold 0	Rising edge	2.1	2.15	2.19	V
		Falling edge	2	2.05	2.1	
$V_{PVD1}$	PVD threshold 1	Rising edge	2.26	2.31	2.36	V
		Falling edge	2.15	2.20	2.25	
$V_{PVD2}$	PVD threshold 2	Rising edge	2.41	2.46	2.51	V
		Falling edge	2.31	2.36	2.41	
$V_{PVD3}$	PVD threshold 3	Rising edge	2.56	2.61	2.66	V
		Falling edge	2.47	2.52	2.57	
$V_{PVD4}$	PVD threshold 4	Rising edge	2.69	2.74	2.79	V
		Falling edge	2.59	2.64	2.69	

Table 24. Embedded reset and power control block characteristics (continued)

Symbol	Parameter	Conditions <sup>(1)</sup>	Min	Typ	Max	Unit
V <sub>PVD5</sub>	PVD threshold 5	Rising edge	2.85	2.91	2.96	V
		Falling edge	2.75	2.81	2.86	
V <sub>PVD6</sub>	PVD threshold 6	Rising edge	2.92	2.98	3.04	V
		Falling edge	2.84	2.90	2.96	
V <sub>hyst_BORH0</sub>	Hysteresis voltage of BORH0	Hysteresis in continuous mode	-	20	-	mV
		Hysteresis in other mode	-	30	-	
V <sub>hyst_BOR_PVD</sub>	Hysteresis voltage of BORH (except BORH0) and PVD	-	-	100	-	mV
I <sub>DD</sub> (BOR_PVD) <sup>(2)</sup>	BOR <sup>(3)</sup> (except BOR0) and PVD consumption from V <sub>DD</sub>	-	-	1.1	1.6	μA
V <sub>PVM1</sub>	V <sub>DDUSB</sub> peripheral voltage monitoring	-	1.18	1.22	1.26	V
V <sub>PVM3</sub>	V <sub>DDA</sub> peripheral voltage monitoring	Rising edge	1.61	1.65	1.69	V
		Falling edge	1.6	1.64	1.68	
V <sub>PVM4</sub>	V <sub>DDA</sub> peripheral voltage monitoring	Rising edge	1.78	1.82	1.86	V
		Falling edge	1.77	1.81	1.85	
V <sub>hyst_PVM3</sub>	PVM3 hysteresis	-	-	10	-	mV
V <sub>hyst_PVM4</sub>	PVM4 hysteresis	-	-	10	-	mV
I <sub>DD</sub> (PVM1/PVM2) <sup>(2)</sup>	PVM1 and PVM2 consumption from V <sub>DD</sub>	-	-	0.2	-	μA
I <sub>DD</sub> (PVM3/PVM4) <sup>(2)</sup>	PVM3 and PVM4 consumption from V <sub>DD</sub>	-	-	2	-	μA

1. Continuous mode means Run/Sleep modes, or temperature sensor enable in Low-power run/Low-power sleep modes.
2. Guaranteed by design.
3. BOR0 is enabled in all modes (except shutdown) and its consumption is therefore included in the supply current characteristics tables.

### 6.3.4 Embedded voltage reference

The parameters given in [Table 25](#) are derived from tests performed under the ambient temperature and supply voltage conditions summarized in [Table 22](#).

**Table 25. Embedded internal voltage reference**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$V_{REFINT}$	Internal reference voltage	$-40\text{ °C} < T_A < +130\text{ °C}$	1.182	1.212	1.232	V
$t_{S\_vrefint}^{(1)}$	ADC sampling time when reading the internal reference voltage	-	4 <sup>(2)</sup>	-	-	μs
$t_{start\_vrefint}$	Start time of reference voltage buffer when ADC is enable	-	-	8	12 <sup>(2)</sup>	μs
$I_{DD}(V_{REFINTBUF})$	$V_{REFINT}$ buffer consumption from $V_{DD}$ when converted by ADC	-	-	12.5	20 <sup>(2)</sup>	μA
$\Delta V_{REFINT}$	Internal reference voltage spread over the temperature range	$V_{DD} = 3\text{ V}$	-	5	7.5 <sup>(2)</sup>	mV
$T_{Coeff}$	Average temperature coefficient	$-40\text{ °C} < T_A < +130\text{ °C}$	-	30	50 <sup>(2)</sup>	ppm/°C
$A_{Coeff}$	Long term stability	1000 hours, $T = 25\text{ °C}$	-	300	1000 <sup>(2)</sup>	ppm
$V_{DDCoeff}$	Average voltage coefficient	$3.0\text{ V} < V_{DD} < 3.6\text{ V}$	-	250	1200 <sup>(2)</sup>	ppm/V
$V_{REFINT\_DIV1}$	1/4 reference voltage	-	24	25	26	% $V_{REFINT}$
$V_{REFINT\_DIV2}$	1/2 reference voltage		49	50	51	
$V_{REFINT\_DIV3}$	3/4 reference voltage		74	75	76	

1. The shortest sampling time can be determined in the application by multiple iterations.
2. Guaranteed by design.

Figure 24.  $V_{REFINT}$  versus temperature

### 6.3.5 Supply current characteristics

The current consumption is a function of several parameters and factors such as the operating voltage, ambient temperature, I/O pin loading, device software configuration, operating frequencies, I/O pin switching rate, program location in memory and executed binary code.

The current consumption is measured as described in [Figure 23: Current consumption measurement scheme with and without external SMPS power supply](#).

#### Typical and maximum current consumption

The MCU is placed under the following conditions:

- All I/O pins are in analog input mode
- All peripherals are disabled except when explicitly mentioned
- The Flash memory access time is adjusted with the minimum wait states number, depending on the  $f_{HCLK}$  frequency (refer to the table “Number of wait states according to CPU clock (HCLK) frequency” available in the RM0351 reference manual).
- When the peripherals are enabled  $f_{PCLK} = f_{HCLK}$

The parameters given in [Table 26](#) to [Table 49](#) are derived from tests performed under ambient temperature and supply voltage conditions summarized in [Table 22: General operating conditions](#).

**Table 26. Current consumption in Run and Low-power run modes, code with data running from Flash, ART enable (Cache ON Prefetch OFF)**

### I/O system current consumption

The current consumption of the I/O system has two components: static and dynamic.

#### I/O static current consumption

All the I/Os used as inputs with pull-up generate current consumption when the pin is externally held low. The value of this current consumption can be simply computed by using the pull-up/pull-down resistors values given in [Table 70: I/O static characteristics](#).

For the output pins, any external pull-down or external load must also be considered to estimate the current consumption.

Additional I/O current consumption is due to I/Os configured as inputs if an intermediate voltage level is externally applied. This current consumption is caused by the input Schmitt trigger circuits used to discriminate the input value. Unless this specific configuration is required by the application, this supply current consumption can be avoided by configuring these I/Os in analog mode. This is notably the case of ADC input pins which should be configured as analog inputs.

**Caution:** Any floating input pin can also settle to an intermediate voltage level or switch inadvertently, as a result of external electromagnetic noise. To avoid current consumption related to floating pins, they must either be configured in analog mode, or forced internally to a definite digital value. This can be done either by using pull-up/down resistors or by configuring the pins in output mode.

#### I/O dynamic current consumption

In addition to the internal peripheral current consumption measured previously (see [Table 50](#)), the I/Os used by an application also contribute to the current consumption. When an I/O pin switches, it uses the current from the I/O supply voltage to supply the I/O pin circuitry and to charge/discharge the capacitive load (internal or external) connected to the pin:

$$I_{SW} = V_{DDIOx} \times f_{SW} \times C$$

where

$I_{SW}$  is the current sunk by a switching I/O to charge/discharge the capacitive load

$V_{DDIOx}$  is the I/O supply voltage

$f_{SW}$  is the I/O switching frequency

$C$  is the total capacitance seen by the I/O pin:  $C = C_{INT} + C_{EXT} + C_S$

$C_S$  is the PCB board capacitance including the pad pin.

The test pin is configured in push-pull output mode and is toggled by software at a fixed frequency.

### On-chip peripheral current consumption

The current consumption of the on-chip peripherals is given in [Table 50](#). The MCU is placed under the following conditions:

- All I/O pins are in Analog mode
- The given value is calculated by measuring the difference of the current consumptions:
  - when the peripheral is clocked on
  - when the peripheral is clocked off
- Ambient operating temperature and supply voltage conditions summarized in [Table 19: Voltage characteristics](#)
- The power consumption of the digital part of the on-chip peripherals is given in [Table 50](#). The power consumption of the analog part of the peripherals (where applicable) is indicated in each related section of the datasheet.

Table 50. Peripheral current consumption

Peripheral		Range 1	Range 2	Low-power run and sleep	Unit
AHB	Bus Matrix <sup>(1)</sup>	4.44	3.75	4.00	μA/MHz

**Table 50. Peripheral current consumption (continued)**

Peripheral		Range 1	Range 2	Low-power run and sleep	Unit
APB2	All APB2 on	55.40	41.33	46.00	μA/MHz
ALL		234.98	195.83	235.70	

1. The BusMatrix is automatically active when at least one master is ON (CPU, DMA).
2. The GPIOx (x= A...I) dynamic current consumption is approximately divided by a factor two versus this table values when the GPIO port is locked thanks to LCKK and LCKy bits in the GPIOx\_LCKR register. In order to save the full GPIOx current consumption, the GPIOx clock should be disabled in the RCC when all port I/Os are used in alternate function or analog mode (clock is only required to read or write into GPIO registers, and is not used in AF or analog modes).
3. The AHB to APB1 Bridge is automatically active when at least one peripheral is ON on the APB1.
4. The AHB to APB2 Bridge is automatically active when at least one peripheral is ON on the APB2.

### 6.3.6 Wakeup time from low-power modes and voltage scaling transition times

The wakeup times given in [Table 51](#) are the latency between the event and the execution of the first user instruction.

The device goes in low-power mode after the WFE (Wait For Event) instruction.

**Table 51. Low-power mode wakeup timings<sup>(1)</sup>**

Symbol	Parameter	Conditions		Typ	Max	Unit
t <sub>WUSLEEP</sub>	Wakeup time from Sleep mode to Run mode	-		6	6	Nb of CPU cycles
t <sub>WULPSLEEP</sub>	Wakeup time from Low-power sleep mode to Low-power run mode	Wakeup in Flash with Flash in power-down during low-power sleep mode (SLEEP_PD=1 in FLASH_ACR) and with clock MSI = 2 MHz		7	9	
t <sub>WUSTOPO0</sub>	Wake up time from Stop 0 mode to Run mode in Flash	Range 1	Wakeup clock MSI = 48 MHz	7.0	11.6	μs

Symbol	Parameter	Conditions	Typ	Max	Unit
$t_{WUUSART}$ $t_{WULPUART}$	Wakeup time needed to calculate the maximum USART/LPUART baud rate permitting to wakeup up from Stop mode when USART/LPUART clock source is HSI16	Stop 0 mode	-	1.7	$\mu\text{s}$
		Stop 1 mode and Stop 2 mode	-	8.5	

1. Guaranteed by design.

### 6.3.7 External clock source characteristics

#### High-speed external user clock generated from an external source

In bypass mode the HSE oscillator is switched off and the input pin is a standard GPIO.

The external clock signal has to respect the I/O characteristics in [Section 6.3.14](#). However, the recommended clock input waveform is shown in [Figure 25](#).

**Table 54. High-speed external user clock characteristics<sup>(1)</sup>**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$f_{HSE\_ext}$	User external clock source frequency	Voltage scaling Range 1	-	8	48	MHz
		Voltage scaling Range 2	-	8	26	
$V_{HSEH}$	OSC_IN input pin high level voltage	-	$0.7 V_{DDIOx}$	-	$V_{DDIOx}$	V
$V_{HSEL}$	OSC_IN input pin low level voltage	-	$V_{SS}$	-	$0.3 V_{DDIOx}$	
$t_{w(HSEH)}$ $t_{w(HSEL)}$	OSC_IN high or low time	Voltage scaling Range 1	7	-	-	ns
		Voltage scaling Range 2	18	-	-	

1. Guaranteed by design.

Figure 25. High-speed external clock source AC timing diagram

**Low-speed external user clock generated from an external source**

In bypass mode the LSE oscillator is switched off and the input pin is a standard GPIO.

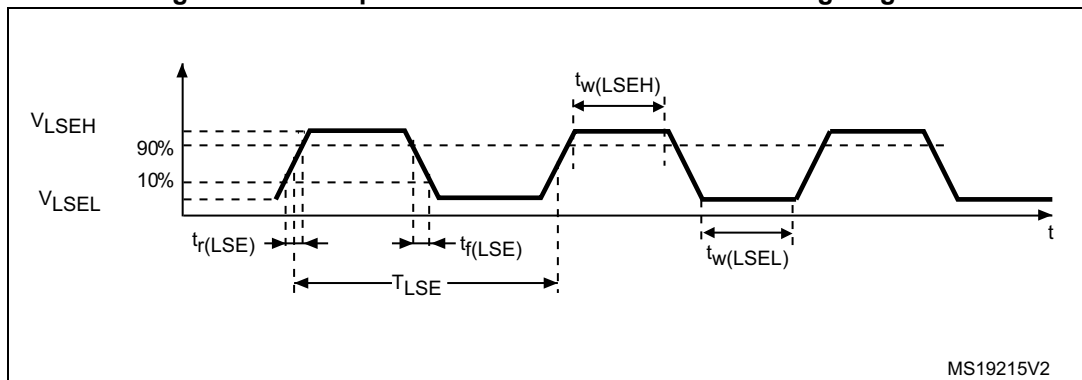

The external clock signal has to respect the I/O characteristics in [Section 6.3.14](#). However, the recommended clock input waveform is shown in [Figure 26](#).

Table 55. Low-speed external user clock characteristics<sup>(1)</sup>

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$f_{LSE\_ext}$	User external clock source frequency	-	-	32.768	1000	kHz
$V_{LSEH}$	OSC32_IN input pin high level voltage	-	$0.7 V_{DDIOx}$	-	$V_{DDIOx}$	V
$V_{LSEL}$	OSC32_IN input pin low level voltage	-	$V_{SS}$	-	$0.3 V_{DDIOx}$	
$t_w(LSEH)$ $t_w(LSEL)$	OSC32_IN high or low time	-	250	-	-	ns

1. Guaranteed by design.

Figure 26. Low-speed external clock source AC timing diagram

**High-speed external clock generated from a crystal/ceramic resonator**

The high-speed external (HSE) clock can be supplied with a 4 to 48 MHz crystal/ceramic resonator oscillator. All the information given in this paragraph are based on design simulation results obtained with typical external components specified in [Table 56](#). In the application, the resonator and the load capacitors have to be placed as close as possible to the oscillator pins in order to minimize output distortion and startup stabilization time. Refer to the crystal resonator manufacturer for more details on the resonator characteristics (frequency, package, accuracy).

**Table 56. HSE oscillator characteristics<sup>(1)</sup>**

Symbol	Parameter	Conditions <sup>(2)</sup>	Min	Typ	Max	Unit
f <sub>OSC_IN</sub>	Oscillator frequency	-	4	8	48	MHz
R <sub>F</sub>	Feedback resistor	-	-	200	-	kΩ
I <sub>DD(HSE)</sub>	HSE current consumption	During startup <sup>(3)</sup>	-	-	5.5	mA
		V <sub>DD</sub> = 3 V, R <sub>m</sub> = 30 Ω, CL = 10 pF@8 MHz	-	0.44	-	
		V <sub>DD</sub> = 3 V, R <sub>m</sub> = 45 Ω, CL = 10 pF@8 MHz	-	0.45	-	
		V <sub>DD</sub> = 3 V, R <sub>m</sub> = 30 Ω, CL = 5 pF@48 MHz	-	0.68	-	
		V <sub>DD</sub> = 3 V, R <sub>m</sub> = 30 Ω, CL = 10 pF@48 MHz	-	0.94	-	
		V <sub>DD</sub> = 3 V, R <sub>m</sub> = 30 Ω, CL = 20 pF@48 MHz	-	1.77	-	
G <sub>m</sub>	Maximum critical crystal transconductance	Startup	-	-	1.5	mA/V
t <sub>SU(HSE)</sub> <sup>(4)</sup>	Startup time	V <sub>DD</sub> is stabilized	-	2	-	ms

1. Guaranteed by design.
2. Resonator characteristics given by the crystal/ceramic resonator manufacturer.
3. This consumption level occurs during the first 2/3 of the t<sub>SU(HSE)</sub> startup time
4. t<sub>SU(HSE)</sub> is the startup time measured from the moment it is enabled (by software) to a stabilized 8 MHz oscillation is reached. This value is measured for a standard crystal resonator and it can vary significantly with the crystal manufacturer

For C<sub>L1</sub> and C<sub>L2</sub>, it is recommended to use high-quality external ceramic capacitors in the 5 pF to 20 pF range (typ.), designed for high-frequency applications, and selected to match the requirements of the crystal or resonator (see [Figure 27](#)). C<sub>L1</sub> and C<sub>L2</sub> are usually the same size. The crystal manufacturer typically specifies a load capacitance which is the series combination of C<sub>L1</sub> and C<sub>L2</sub>. PCB and MCU pin capacitance must be included (10 pF can be used as a rough estimate of the combined pin and board capacitance) when sizing C<sub>L1</sub> and C<sub>L2</sub>.

Note: For information on selecting the crystal, refer to the application note AN2867 “Oscillator design guide for ST microcontrollers” available from the ST website [www.st.com](http://www.st.com).

Figure 27. Typical application with an 8 MHz crystal

1.  $R_{EXT}$  value depends on the crystal characteristics.

### Low-speed external clock generated from a crystal resonator

The low-speed external (LSE) clock can be supplied with a 32.768 kHz crystal resonator oscillator. All the information given in this paragraph are based on design simulation results obtained with typical external components specified in [Table 57](#). In the application, the resonator and the load capacitors have to be placed as close as possible to the oscillator pins in order to minimize output distortion and startup stabilization time. Refer to the crystal resonator manufacturer for more details on the resonator characteristics (frequency, package, accuracy).

Table 57. LSE oscillator characteristics ( $f_{LSE} = 32.768 \text{ kHz}$ )<sup>(1)</sup>

Symbol	Parameter	Conditions <sup>(2)</sup>	Min	Typ	Max	Unit
$I_{DD(LSE)}$	LSE current consumption	LSEDRV[1:0] = 00 Low drive capability	-	250	-	nA
		LSEDRV[1:0] = 01 Medium low drive capability	-	315	-	
		LSEDRV[1:0] = 10 Medium high drive capability	-	500	-	
		LSEDRV[1:0] = 11 High drive capability	-	630	-	
$G_{m_{critmax}}$	Maximum critical crystal gm	LSEDRV[1:0] = 00 Low drive capability	-	-	0.5	$\mu A/V$
		LSEDRV[1:0] = 01 Medium low drive capability	-	-	0.75	
		LSEDRV[1:0] = 10 Medium high drive capability	-	-	1.7	
		LSEDRV[1:0] = 11 High drive capability	-	-	2.7	
$t_{SU(LSE)}$ <sup>(3)</sup>	Startup time	$V_{DD}$ is stabilized	-	2	-	s

1. Guaranteed by design.
2. Refer to the note and caution paragraphs below the table, and to the application note AN2867 “Oscillator design guide for ST microcontrollers”.
3.  $t_{SU(LSE)}$  is the startup time measured from the moment it is enabled (by software) to a stabilized 32.768 kHz oscillation is reached. This value is measured for a standard crystal and it can vary significantly with the crystal manufacturer

**Note:** For information on selecting the crystal, refer to the application note AN2867 “Oscillator design guide for ST microcontrollers” available from the ST website [www.st.com](http://www.st.com).

**Figure 28. Typical application with a 32.768 kHz crystal**

**Note:** An external resistor is not required between OSC32\_IN and OSC32\_OUT and it is forbidden to add one.

### 6.3.8 Internal clock source characteristics

The parameters given in [Table 58](#) are derived from tests performed under ambient temperature and supply voltage conditions summarized in [Table 22: General operating conditions](#). The provided curves are characterization results, not tested in production.

#### High-speed internal (HSI16) RC oscillator

**Table 58. HSI16 oscillator characteristics<sup>(1)</sup>**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$f_{HSI16}$	HSI16 Frequency	$V_{DD}=3.0\text{ V}$ , $T_A=30\text{ °C}$	15.88	-	16.08	MHz
TRIM	HSI16 user trimming step	Trimming code is not a multiple of 64	0.2	0.3	0.4	%
		Trimming code is a multiple of 64	-4	-6	-8	
$DuCy(HSI16)^{(2)}$	Duty Cycle	-	45	-	55	%

			Range 11	-	-	155	190	

1. Guaranteed by characterization results.
2. This is a deviation for an individual part once the initial frequency has been measured.
3. Sampling mode means Low-power run/Low-power sleep modes with Temperature sensor disable.
4. Average period of MSI @48 MHz is compared to a real 48 MHz clock over 28 cycles. It includes frequency tolerance + jitter of MSI @48 MHz clock.
5. Only accumulated jitter of MSI @48 MHz is extracted over 28 cycles.  
For next transition: min. and max. jitter of 2 consecutive frame of 28 cycles of the MSI @48 MHz, for 1000 captures over 28 cycles.  
For paired transitions: min. and max. jitter of 2 consecutive frame of 56 cycles of the MSI @48 MHz, for 1000 captures over 56 cycles.
6. Guaranteed by design.

### 6.3.9 PLL characteristics

The parameters given in [Table 62](#) are derived from tests performed under temperature and  $V_{DD}$  supply voltage conditions summarized in [Table 22: General operating conditions](#).

**Table 62. PLL, PLLSAI1, PLLSAI2 characteristics<sup>(1)</sup>**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$f_{PLL\_IN}$	PLL input clock <sup>(2)</sup>	-	4	-	16	MHz
	PLL input clock duty cycle	-	45	-	55	%
$f_{PLL\_P\_OUT}$	PLL multiplier output clock P	Voltage scaling Range 1	2.0645	-	80	MHz
		Voltage scaling Range 2	2.0645	-	26	
$f_{PLL\_Q\_OUT}$	PLL multiplier output clock Q	Voltage scaling Range 1	8	-	80	MHz
		Voltage scaling Range 2	8	-	26	
$f_{PLL\_R\_OUT}$	PLL multiplier output clock R	Voltage scaling Range 1	8	-	80	MHz
		Voltage scaling Range 2	8	-	26	
$f_{VCO\_OUT}$	PLL VCO output	Voltage scaling Range 1	64	-	344	MHz
		Voltage scaling Range 2	64	-	128	
$t_{LOCK}$	PLL lock time	-	-	15	40	$\mu$ s
Jitter	RMS cycle-to-cycle jitter	System clock 80 MHz	-	40	-	$\pm$ ps
	RMS period jitter		-	30	-	
$I_{DD}(PLL)$	PLL power consumption on $V_{DD}$ <sup>(1)</sup>	VCO freq = 64 MHz	-	150	200	$\mu$ A
		VCO freq = 96 MHz	-	200	260	
		VCO freq = 192 MHz	-	300	380	
		VCO freq = 344 MHz	-	520	650	

1. Guaranteed by design.

2. Take care of using the appropriate division factor M to obtain the specified PLL input clock values. The M factor is shared between the 3 PLLs.

### 6.3.10 Flash memory characteristics

**Table 63. Flash memory characteristics<sup>(1)</sup>**

Symbol	Parameter	Conditions	Typ	Max	Unit
$t_{prog}$	64-bit programming time	-	81.69	90.76	$\mu$ s
$t_{prog\_row}$	one row (32 double word) programming time	normal programming	2.61	2.90	ms
		fast programming	1.91	2.12	
$t_{prog\_page}$	one page (2 Kbyte) programming time	normal programming	20.91	23.24	ms
		fast programming	15.29	16.98	
$t_{ERASE}$	Page (2 KB) erase time	-	22.02	24.47	ms
$t_{prog\_bank}$	one bank (512 Kbyte) programming time	normal programming	5.35	5.95	s
		fast programming	3.91	4.35	

**Table 63. Flash memory characteristics<sup>(1)</sup> (continued)**

Symbol	Parameter	Conditions	Typ	Max	Unit
t <sub>ME</sub>	Mass erase time (one or two banks)	-	22.13	24.59	ms
I <sub>DD</sub>	Average consumption from V <sub>DD</sub>	Write mode	3.4	-	mA
		Erase mode	3.4	-	
	Maximum current (peak)	Write mode	7 (for 2 μs)	-	
		Erase mode	7 (for 41 μs)	-	

1. Guaranteed by design.

**Table 64. Flash memory endurance and data retention**

Symbol	Parameter	Conditions	Min <sup>(1)</sup>	Unit
N <sub>END</sub>	Endurance	T <sub>A</sub> = -40 to +105 °C	10	kcycles
t <sub>RET</sub>	Data retention	1 kcycle <sup>(2)</sup> at T <sub>A</sub> = 85 °C	30	Years
		1 kcycle <sup>(2)</sup> at T <sub>A</sub> = 105 °C	15	
		1 kcycle <sup>(2)</sup> at T <sub>A</sub> = 125 °C	7	
		10 kcycles <sup>(2)</sup> at T <sub>A</sub> = 55 °C	30	
		10 kcycles <sup>(2)</sup> at T <sub>A</sub> = 85 °C	15	
		10 kcycles <sup>(2)</sup> at T <sub>A</sub> = 105 °C	10	

1. Guaranteed by characterization results.

2. Cycling performed over the whole temperature range.

### 6.3.11 EMC characteristics

Susceptibility tests are performed on a sample basis during device characterization.

#### Functional EMS (electromagnetic susceptibility)

While a simple application is executed on the device (toggling two LEDs through I/O ports), the device is stressed by two electromagnetic events until a failure occurs. The failure is indicated by the LEDs:

- **Electrostatic discharge (ESD)** (positive and negative) is applied to all device pins until a functional disturbance occurs. This test is compliant with the IEC 61000-4-2 standard.
- **FTB:** A Burst of Fast Transient voltage (positive and negative) is applied to V<sub>DD</sub> and V<sub>SS</sub> through a 100 pF capacitor, until a functional disturbance occurs. This test is compliant with the IEC 61000-4-4 standard.

A device reset allows normal operations to be resumed.

The test results are given in [Table 65](#). They are based on the EMS levels and classes defined in application note AN1709.

Table 65. EMS characteristics

Symbol	Parameter	Conditions	Level/Class
$V_{FESD}$	Voltage limits to be applied on any I/O pin to induce a functional disturbance	$V_{DD} = 3.3\text{ V}$ , $T_A = +25\text{ °C}$ , $f_{HCLK} = 80\text{ MHz}$ , conforming to IEC 61000-4-2	2B
$V_{EFTB}$	Fast transient voltage burst limits to be applied through 100 pF on $V_{DD}$ and $V_{SS}$ pins to induce a functional disturbance	$V_{DD} = 3.3\text{ V}$ , $T_A = +25\text{ °C}$ , $f_{HCLK} = 80\text{ MHz}$ , conforming to IEC 61000-4-4	5A

### Designing hardened software to avoid noise problems

EMC characterization and optimization are performed at component level with a typical application environment and simplified MCU software. It should be noted that good EMC performance is highly dependent on the user application and the software in particular.

Therefore it is recommended that the user applies EMC software optimization and prequalification tests in relation with the EMC level requested for his application.

### Software recommendations

The software flowchart must include the management of runaway conditions such as:

- Corrupted program counter
- Unexpected reset
- Critical Data corruption (control registers...)

### Prequalification trials

Most of the common failures (unexpected reset and program counter corruption) can be reproduced by manually forcing a low state on the NRST pin or the Oscillator pins for 1 second.

To complete these trials, ESD stress can be applied directly on the device, over the range of specification values. When unexpected behavior is detected, the software can be hardened to prevent unrecoverable errors occurring (see application note AN1015).

### Electromagnetic interference (EMI)

The electromagnetic field emitted by the device are monitored while a simple application is executed (toggling two LEDs through the I/O ports). This emission test is compliant with IEC 61967-2 standard which specifies the test board and the pin loading.

Table 66. EMI characteristics

Symbol	Parameter	Conditions	Monitored frequency band	Max vs. $[f_{HSE}/f_{HCLK}]$	Unit
				8 MHz / 80 MHz	
$S_{EMI}$	Peak level	$V_{DD} = 3.6\text{ V}$ , $T_A = 25\text{ °C}$ , BGA169 package compliant with IEC 61967-2	0.1 MHz to 30 MHz	3	dB $\mu$ V
			30 MHz to 130 MHz	-2	
			130 MHz to 1 GHz	0	
			1 GHz to 2 GHz	8	
			EMI Level	1.5	-

### 6.3.12 Electrical sensitivity characteristics

Based on three different tests (ESD, LU) using specific measurement methods, the device is stressed in order to determine its performance in terms of electrical sensitivity.

#### Electrostatic discharge (ESD)

Electrostatic discharges (a positive then a negative pulse separated by 1 second) are applied to the pins of each sample according to each pin combination. The sample size depends on the number of supply pins in the device (3 parts × (n + 1) supply pins). This test conforms to the ANSI/JEDEC standard.

**Table 67. ESD absolute maximum ratings**

Symbol	Ratings	Conditions	Class	Maximum value <sup>(1)</sup>	Unit
V <sub>ESD(HBM)</sub>	Electrostatic discharge voltage (human body model)	T <sub>A</sub> = +25 °C, conforming to ANSI/ESDA/JEDEC JS-001	2	2000	V
V <sub>ESD(CDM)</sub>	Electrostatic discharge voltage (charge device model)	T <sub>A</sub> = +25 °C, conforming to ANSI/ESD STM5.3.1	C3	250	

1. Guaranteed by characterization results.

#### Static latch-up

Two complementary static tests are required on six parts to assess the latch-up performance:

- a supply overvoltage is applied to each power supply pin
- a current injection is applied to each input, output and configurable I/O pin.

These tests are compliant with EIA/JESD 78A IC latch-up standard.

**Table 68. Electrical sensitivities**

Symbol	Parameter	Conditions	Class
LU	Static latch-up class	T <sub>A</sub> = +105 °C conforming to JESD78A	II level A <sup>(1)</sup>

1. Negative injection is limited to -30 mA for PF0, PF1, PG6, PG7, PG8, PG12, PG13, PG14.

### 6.3.13 I/O current injection characteristics

As a general rule, current injection to the I/O pins, due to external voltage below V<sub>SS</sub> or above V<sub>DDIOx</sub> (for standard, 3.3 V-capable I/O pins) should be avoided during normal product operation. However, in order to give an indication of the robustness of the microcontroller in cases when abnormal injection accidentally happens, susceptibility tests are performed on a sample basis during device characterization.

#### Functional susceptibility to I/O current injection

While a simple application is executed on the device, the device is stressed by injecting current into the I/O pins programmed in floating input mode. While current is injected into the I/O pin, one at a time, the device is checked for functional failures.

The failure is indicated by an out of range parameter: ADC error above a certain limit (higher than 5 LSB TUE), out of conventional limits of induced leakage current on adjacent pins (out

of the  $-5 \mu\text{A}/+0 \mu\text{A}$  range) or other functional failure (for example reset occurrence or oscillator frequency deviation).

The characterization results are given in [Table 69](#).

Negative induced leakage current is caused by negative injection and positive induced leakage current is caused by positive injection.

**Table 69. I/O current injection susceptibility<sup>(1)</sup>**

Symbol	Description	Functional susceptibility		Unit
		Negative injection	Positive injection	
I <sub>INJ</sub>	Injected current on all pins except PA4, PA5, PB0, PF12, PF13, OPAMP1_V1NM, OPAMP2_V1NM	-5	NA <sup>(2)</sup>	mA
	Injected current on pins PB0, PF12, PF13	0	NA <sup>(2)</sup>	
	Injected current on OPAMP1_V1NM, OPAMP2_V1NM	0	0	
	Injected current on PA4, PA5 pins	-5	0	

1. Guaranteed by characterization.
2. Injection is not possible

### 6.3.14 I/O port characteristics

#### General input/output characteristics

Unless otherwise specified, the parameters given in [Table 70](#) are derived from tests performed under the conditions summarized in [Table 22: General operating conditions](#). All I/Os are designed as CMOS- and TTL-compliant (except BOOT0).

*Note:* For information on GPIO configuration, refer to the application note AN4899 “STM32 GPIO configuration for hardware settings and low-power consumption” available from the ST website [www.st.com](http://www.st.com).

**Table 70. I/O static characteristics**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
V <sub>IL</sub> <sup>(1)</sup>	I/O input low level voltage except BOOT0	1.62 V < V <sub>DDIOx</sub> < 3.6 V	-	-	0.3xV <sub>DDIOx</sub> <sup>(2)</sup>	V
	I/O input low level voltage except BOOT0	1.62 V < V <sub>DDIOx</sub> < 3.6 V	-	-	0.39xV <sub>DDIOx</sub> - 0.06 <sup>(3)</sup>	
	I/O input low level voltage except BOOT0	1.08 V < V <sub>DDIOx</sub> < 1.62 V	-	-	0.43xV <sub>DDIOx</sub> - 0.1 <sup>(3)</sup>	
	BOOT0 I/O input low level voltage	1.62 V < V <sub>DDIOx</sub> < 3.6 V	-	-	0.17xV <sub>DDIOx</sub> <sup>(3)</sup>	

Table 70. I/O static characteristics (continued)

Symbol	Parameter	Conditions	Min	Typ	Max	Unit

C <sub>IO</sub>	I/O pin capacitance	-	-	5	-	pF

1. Refer to [Figure 32: I/O input characteristics](#).

2. Guaranteed by test production.

3. Guaranteed by design.

4. This value represents the pad leakage of the IO itself. The total product pad leakage is provided by this formula:  
 $I_{Total\_lkg\_max} = 10 \mu A + [number\ of\ IOs\ where\ V_{IN}\ is\ applied\ on\ the\ pad] \times I_{lkg}(Max)$ .

5. All FT\_xx GPIOs except FT\_lu, FT\_u, PB2 and PC3.
6.  $\text{Max}(V_{DDXX})$  is the maximum value of all the I/O supplies.
7. To sustain a voltage higher than  $\text{Min}(V_{DD}, V_{DDA}, V_{DDIO2}, V_{DDUSB}, V_{LCD}) + 0.3 \text{ V}$ , the internal Pull-up and Pull-Down resistors must be disabled.
8. Refer to  $I_{\text{bias}}$  in [Table 86: OPAMP characteristics](#) for the values of the OPAMP dedicated input leakage current.
9. Pull-up and pull-down resistors are designed with a true resistance in series with a switchable PMOS/NMOS. This PMOS/NMOS contribution to the series resistance is minimal (~10% order).

All I/Os are CMOS- and TTL-compliant (no software configuration required). Their characteristics cover more than the strict CMOS-technology or TTL parameters. The coverage of these requirements is shown in [Figure 32](#) for standard I/Os, and in [Figure 32](#) for 5 V tolerant I/Os.

**Figure 32. I/O input characteristics**

**Output driving current**

The GPIOs (general purpose input/outputs) can sink or source up to  $\pm 8 \text{ mA}$ , and sink or source up to  $\pm 20 \text{ mA}$  (with a relaxed  $V_{OL}/V_{OH}$ ).

GPIOs PC13, PC14 and PC15 are supplied through the power switch, limiting source capability up to 3 mA only.

In the user application, the number of I/O pins which can drive current must be limited to respect the absolute maximum rating specified in [Section 6.2](#):

- The sum of the currents sourced by all the I/Os on  $V_{DDIOx}$ , plus the maximum consumption of the MCU sourced on  $V_{DD}$ , cannot exceed the absolute maximum rating  $\Sigma I_{VDD}$  (see [Table 19: Voltage characteristics](#)).
- The sum of the currents sunk by all the I/Os on  $V_{SS}$ , plus the maximum consumption of the MCU sunk on  $V_{SS}$ , cannot exceed the absolute maximum rating  $\Sigma I_{VSS}$  (see [Table 19: Voltage characteristics](#)).

**Output voltage levels**

Unless otherwise specified, the parameters given in the table below are derived from tests performed under the ambient temperature and supply voltage conditions summarized in [Table 22: General operating conditions](#). All I/Os are CMOS- and TTL-compliant (FT OR TT unless otherwise specified).

**Table 71. Output voltage characteristics<sup>(1)</sup>**

Symbol	Parameter	Conditions	Min	Max	Unit
$V_{OL}$	Output low level voltage for an I/O pin	CMOS port <sup>(2)</sup> $ I_{IO}  = 8 \text{ mA}^{(3)}$ $V_{DDIOx} \geq 2.7 \text{ V}$	-	0.4	V
$V_{OH}$	Output high level voltage for an I/O pin		$V_{DDIOx}-0.4$	-	
$V_{OL}^{(4)}$	Output low level voltage for an I/O pin	TTL port <sup>(2)</sup> $ I_{IO}  = 8 \text{ mA}^{(5)}$ $V_{DDIOx} \geq 2.7 \text{ V}$	-	0.4	
$V_{OH}^{(4)}$	Output high level voltage for an I/O pin		2.4	-	
$V_{OL}^{(4)}$	Output low level voltage for an I/O pin	PC13, PC14 and PC15 $ I_{IO}  = 3 \text{ mA}$ $V_{DDIOx} \geq 2.7 \text{ V}$	-	0.07	
$V_{OH}^{(4)}$	Output high level voltage for an I/O pin		$V_{DDIOx}-0.35$	-	
$V_{OL}^{(4)}$	Output low level voltage for an I/O pin	$ I_{IO}  = 20 \text{ mA}^{(5)}$ $V_{DDIOx} \geq 2.7 \text{ V}$	-	1.3	
$V_{OH}^{(4)}$	Output high level voltage for an I/O pin		$V_{DDIOx}-1.3$	-	
$V_{OL}^{(4)}$	Output low level voltage for an I/O pin	$ I_{IO}  = 4 \text{ mA}^{(3)}$ $V_{DDIOx} \geq 1.62 \text{ V}$	-	0.45	
$V_{OH}^{(4)}$	Output high level voltage for an I/O pin		$V_{DDIOx}-0.45$	-	
$V_{OL}^{(4)}$	Output low level voltage for an I/O pin	$ I_{IO}  = 2 \text{ mA}$ $1.62 \text{ V} \geq V_{DDIOx} \geq 1.08 \text{ V}$	-	$0.35 \times V_{DDIOx}$	
$V_{OH}^{(4)}$	Output high level voltage for an I/O pin		$0.65 \times V_{DDIOx}$	-	
$V_{OLFM+}^{(4)}$	Output low level voltage for an FT I/O pin in FM+ mode (FT I/O with "f" option)	$ I_{IO}  = 20 \text{ mA}$ $V_{DDIOx} \geq 2.7 \text{ V}$	-	0.4	
		$ I_{IO}  = 10 \text{ mA}$ $V_{DDIOx} \geq 1.62 \text{ V}$	-	0.4	
		$ I_{IO}  = 2 \text{ mA}$ $1.62 \text{ V} \geq V_{DDIOx} \geq 1.08 \text{ V}$	-	0.4	

1. The  $I_{IO}$  current sourced or sunk by the device must always respect the absolute maximum rating specified in [Table 19: Voltage characteristics](#), and the sum of the currents sourced or sunk by all the I/Os (I/O ports and control pins) must always respect the absolute maximum ratings  $\Sigma I_{IO}$ .
2. TTL and CMOS outputs are compatible with JEDEC standards JESD36 and JESD52.
3. PC13, PC14 and PC15 are tested/characterized at their maximum current of 3 mA.
4. Guaranteed by design.
5. Not applicable to PC13, PC14 and PC15.

**Input/output AC characteristics**

The definition and values of input/output AC characteristics are given in [Figure 33](#) and [Table 72](#), respectively.

Unless otherwise specified, the parameters given are derived from tests performed under the ambient temperature and supply voltage conditions summarized in [Table 22: General operating conditions](#).

Table 72. I/O AC characteristics<sup>(1)(2)</sup>

Speed	Symbol	Parameter	Conditions	Min	Max	Unit
00	Fmax	Maximum frequency	C=50 pF, 2.7 V ≤ V <sub>DDIOx</sub> ≤ 3.6 V	-	5	MHz
			C=50 pF, 1.62 V ≤ V <sub>DDIOx</sub> ≤ 2.7 V	-	1	
			C=50 pF, 1.08 V ≤ V <sub>DDIOx</sub> ≤ 1.62 V	-	0.1	
			C=10 pF, 2.7 V ≤ V <sub>DDIOx</sub> ≤ 3.6 V	-	10	
			C=10 pF, 1.62 V ≤ V <sub>DDIOx</sub> ≤ 2.7 V	-	1.5	
			C=10 pF, 1.08 V ≤ V <sub>DDIOx</sub> ≤ 1.62 V	-	0.1	
	Tr/Tf	Output rise and fall time	C=50 pF, 2.7 V ≤ V <sub>DDIOx</sub> ≤ 3.6 V	-	25	ns
			C=50 pF, 1.62 V ≤ V <sub>DDIOx</sub> ≤ 2.7 V	-	52	
			C=50 pF, 1.08 V ≤ V <sub>DDIOx</sub> ≤ 1.62 V	-	140	
			C=10 pF, 2.7 V ≤ V <sub>DDIOx</sub> ≤ 3.6 V	-	17	
			C=10 pF, 1.62 V ≤ V <sub>DDIOx</sub> ≤ 2.7 V	-	37	
			C=10 pF, 1.08 V ≤ V <sub>DDIOx</sub> ≤ 1.62 V	-	110	
01	Fmax	Maximum frequency	C=50 pF, 2.7 V ≤ V <sub>DDIOx</sub> ≤ 3.6 V	-	25	MHz
			C=50 pF, 1.62 V ≤ V <sub>DDIOx</sub> ≤ 2.7 V	-	10	
			C=50 pF, 1.08 V ≤ V <sub>DDIOx</sub> ≤ 1.62 V	-	1	
			C=10 pF, 2.7 V ≤ V <sub>DDIOx</sub> ≤ 3.6 V	-	50	
			C=10 pF, 1.62 V ≤ V <sub>DDIOx</sub> ≤ 2.7 V	-	15	
			C=10 pF, 1.08 V ≤ V <sub>DDIOx</sub> ≤ 1.62 V	-	1	
	Tr/Tf	Output rise and fall time	C=50 pF, 2.7 V ≤ V <sub>DDIOx</sub> ≤ 3.6 V	-	9	ns
			C=50 pF, 1.62 V ≤ V <sub>DDIOx</sub> ≤ 2.7 V	-	16	
			C=50 pF, 1.08 V ≤ V <sub>DDIOx</sub> ≤ 1.62 V	-	40	
			C=10 pF, 2.7 V ≤ V <sub>DDIOx</sub> ≤ 3.6 V	-	4.5	
			C=10 pF, 1.62 V ≤ V <sub>DDIOx</sub> ≤ 2.7 V	-	9	
			C=10 pF, 1.08 V ≤ V <sub>DDIOx</sub> ≤ 1.62 V	-	21	

Table 72. I/O AC characteristics<sup>(1)(2)</sup> (continued)

Speed	Symbol	Parameter	Conditions	Min	Max	Unit
10	Fmax	Maximum frequency	C=50 pF, 2.7 V ≤ V <sub>DDIOx</sub> ≤ 3.6 V	-	50	MHz
			C=50 pF, 1.62 V ≤ V <sub>DDIOx</sub> ≤ 2.7 V	-	25	
			C=50 pF, 1.08 V ≤ V <sub>DDIOx</sub> ≤ 1.62 V	-	5	
			C=10 pF, 2.7 V ≤ V <sub>DDIOx</sub> ≤ 3.6 V	-	100 <sup>(3)</sup>	
			C=10 pF, 1.62 V ≤ V <sub>DDIOx</sub> ≤ 2.7 V	-	37.5	
			C=10 pF, 1.08 V ≤ V <sub>DDIOx</sub> ≤ 1.62 V	-	5	
	Tr/Tf	Output rise and fall time	C=50 pF, 2.7 V ≤ V <sub>DDIOx</sub> ≤ 3.6 V	-	5.8	ns
			C=50 pF, 1.62 V ≤ V <sub>DDIOx</sub> ≤ 2.7 V	-	11	
			C=50 pF, 1.08 V ≤ V <sub>DDIOx</sub> ≤ 1.62 V	-	28	
			C=10 pF, 2.7 V ≤ V <sub>DDIOx</sub> ≤ 3.6 V	-	2.5	
			C=10 pF, 1.62 V ≤ V <sub>DDIOx</sub> ≤ 2.7 V	-	5	
			C=10 pF, 1.08 V ≤ V <sub>DDIOx</sub> ≤ 1.62 V	-	12	
11	Fmax	Maximum frequency	C=30 pF, 2.7 V ≤ V <sub>DDIOx</sub> ≤ 3.6 V	-	120 <sup>(3)</sup>	MHz
			C=30 pF, 1.62 V ≤ V <sub>DDIOx</sub> ≤ 2.7 V	-	50	
			C=30 pF, 1.08 V ≤ V <sub>DDIOx</sub> ≤ 1.62 V	-	10	
			C=10 pF, 2.7 V ≤ V <sub>DDIOx</sub> ≤ 3.6 V	-	180 <sup>(3)</sup>	
			C=10 pF, 1.62 V ≤ V <sub>DDIOx</sub> ≤ 2.7 V	-	75	
			C=10 pF, 1.08 V ≤ V <sub>DDIOx</sub> ≤ 1.62 V	-	10	
	Tr/Tf	Output rise and fall time	C=30 pF, 2.7 V ≤ V <sub>DDIOx</sub> ≤ 3.6 V	-	3.3	ns
			C=30 pF, 1.62 V ≤ V <sub>DDIOx</sub> ≤ 2.7 V	-	6	
			C=30 pF, 1.08 V ≤ V <sub>DDIOx</sub> ≤ 1.62 V	-	16	
Fm+	Fmax	Maximum frequency	C=50 pF, 1.6 V ≤ V <sub>DDIOx</sub> ≤ 3.6 V	-	1	MHz
	Tf	Output fall time <sup>(4)</sup>		-	5	ns

1. The I/O speed is configured using the OSPEEDRy[1:0] bits. The Fm+ mode is configured in the SYSCFG\_CFGR1 register. Refer to the RM0351 reference manual for a description of GPIO Port configuration register.
2. Guaranteed by design.
3. This value represents the I/O capability but the maximum system frequency is limited to 80 MHz.
4. The fall time is defined between 70% and 30% of the output waveform accordingly to I<sup>2</sup>C specification.

Figure 33. I/O AC characteristics definition<sup>(1)</sup>

1. Refer to [Table 72: I/O AC characteristics](#).

### 6.3.15 NRST pin characteristics

The NRST pin input driver uses the CMOS technology. It is connected to a permanent pull-up resistor,  $R_{PU}$ .

Unless otherwise specified, the parameters given in the table below are derived from tests performed under the ambient temperature and supply voltage conditions summarized in [Table 22: General operating conditions](#).

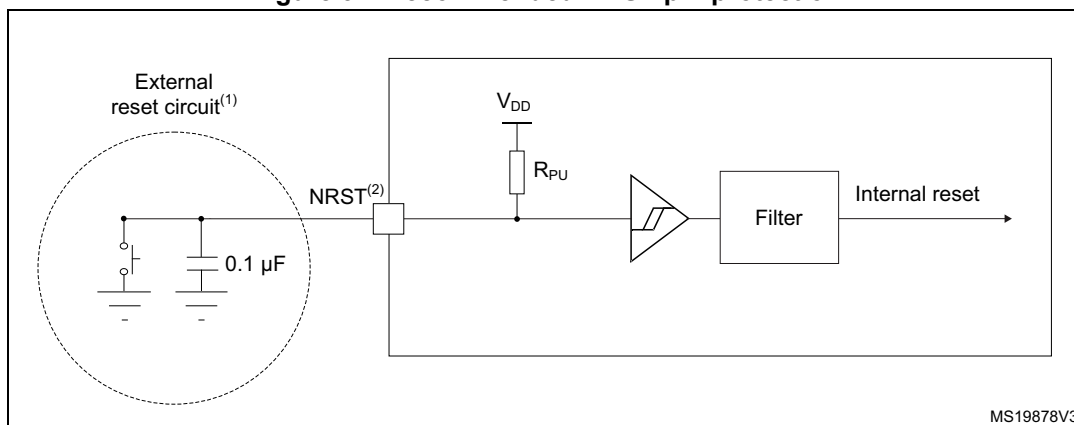

Table 73. NRST pin characteristics<sup>(1)</sup>

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$V_{IL(NRST)}$	NRST input low level voltage	-	-	-	$0.3 \times V_{DDIOx}$	V
$V_{IH(NRST)}$	NRST input high level voltage	-	$0.7 \times V_{DDIOx}$	-	-	
$V_{hys(NRST)}$	NRST Schmitt trigger voltage hysteresis	-	-	200	-	mV
$R_{PU}$	Weak pull-up equivalent resistor <sup>(2)</sup>	$V_{IN} = V_{SS}$	25	40	55	k $\Omega$
$V_{F(NRST)}$	NRST input filtered pulse	-	-	-	70	ns
$V_{NF(NRST)}$	NRST input not filtered pulse	$1.71 \text{ V} \leq V_{DD} \leq 3.6 \text{ V}$	350	-	-	ns

1. Guaranteed by design.
2. The pull-up is designed with a true resistance in series with a switchable PMOS. This PMOS contribution to the series resistance is minimal (~10% order).

Figure 34. Recommended NRST pin protection

1. The reset network protects the device against parasitic resets.
2. The user must ensure that the level on the NRST pin can go below the  $V_{IL(NRST)}$  max level specified in [Table 73](#). Otherwise the reset is not taken into account by the device.
3. The external capacitor on NRST must be placed as close as possible to the device.

### 6.3.16 Extended interrupt and event controller input (EXTI) characteristics

The pulse on the interrupt input must have a minimal length in order to guarantee that it is detected by the event controller.

Table 74. EXTI Input Characteristics<sup>(1)</sup>

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
PLEC	Pulse length to event controller	-	20	-	-	ns

1. Guaranteed by design.

### 6.3.17 Analog switches booster

Table 75. Analog switches booster characteristics<sup>(1)</sup>

Symbol	Parameter	Min	Typ	Max	Unit
$V_{DD}$	Supply voltage	1.62	-	3.6	V
$t_{SU(BOOST)}$	Booster startup time	-	-	240	µs
$I_{DD(BOOST)}$	Booster consumption for $1.62\text{ V} \leq V_{DD} \leq 2.0\text{ V}$	-	-	250	µA
	Booster consumption for $2.0\text{ V} \leq V_{DD} \leq 2.7\text{ V}$	-	-	500	
	Booster consumption for $2.7\text{ V} \leq V_{DD} \leq 3.6\text{ V}$	-	-	900	

1. Guaranteed by design.

### 6.3.18 Analog-to-Digital converter characteristics

Unless otherwise specified, the parameters given in [Table 76](#) are preliminary values derived from tests performed under ambient temperature,  $f_{PCLK}$  frequency and  $V_{DDA}$  supply voltage conditions summarized in [Table 22: General operating conditions](#).

*Note:* It is recommended to perform a calibration after each power-up.

**Table 76. ADC characteristics<sup>(1) (2)</sup>**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$V_{DDA}$	Analog supply voltage	-	1.62	-	3.6	V
$V_{REF+}$	Positive reference voltage	$V_{DDA} \geq 2\text{ V}$	2	-	$V_{DDA}$	V
		$V_{DDA} < 2\text{ V}$	$V_{DDA}$			V
$V_{REF-}$	Negative reference voltage	-	$V_{SSA}$			V
$f_{ADC}$	ADC clock frequency	Range 1	0.14	-	80	MHz
		Range 2	0.14	-	26	
$f_s$	Sampling rate for FAST channels	Resolution = 12 bits	-	-	5.33	MSPS
		Resolution = 10 bits	-	-	6.15	
		Resolution = 8 bits	-	-	7.27	
		Resolution = 6 bits	-	-	8.88	
	Sampling rate for SLOW channels	Resolution = 12 bits	-	-	4.21	
		Resolution = 10 bits	-	-	4.71	
		Resolution = 8 bits	-	-	5.33	
		Resolution = 6 bits	-	-	6.15	
$f_{TRIG}$	External trigger frequency	$f_{ADC} = 80\text{ MHz}$ Resolution = 12 bits	-	-	5.33	MHz
		Resolution = 12 bits	-	-	15	$1/f_{ADC}$
$V_{AIN}^{(3)}$	Conversion voltage range <sup>(2)</sup>	-	0	-	$V_{REF+}$	V
$R_{AIN}$	External input impedance	-	-	-	50	k $\Omega$
$C_{ADC}$	Internal sample and hold capacitor	-	-	5	-	pF
$t_{STAB}$	Power-up time	-	1			conversion cycle
$t_{CAL}$	Calibration time	$f_{ADC} = 80\text{ MHz}$	1.45			$\mu\text{s}$
		-	116			$1/f_{ADC}$
$t_{LATR}$	Trigger conversion latency Regular and injected channels without conversion abort	CKMODE = 00	1.5	2	2.5	$1/f_{ADC}$
		CKMODE = 01	-	-	2.0	
		CKMODE = 10	-	-	2.25	
		CKMODE = 11	-	-	2.125	

**Table 76. ADC characteristics<sup>(1) (2)</sup> (continued)**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$t_{LATRINJ}$	Trigger conversion latency Injected channels aborting a regular conversion	CKMODE = 00	2.5	3	3.5	$1/f_{ADC}$
		CKMODE = 01	-	-	3.0	
		CKMODE = 10	-	-	3.25	
		CKMODE = 11	-	-	3.125	
$t_s$	Sampling time	$f_{ADC} = 80$ MHz	0.03125	-	8.00625	$\mu s$
		-	2.5	-	640.5	$1/f_{ADC}$
$t_{ADCVREG\_STUP}$	ADC voltage regulator start-up time	-	-	-	20	$\mu s$
$t_{CONV}$	Total conversion time (including sampling time)	$f_{ADC} = 80$ MHz Resolution = 12 bits	0.1875	-	8.1625	$\mu s$
		Resolution = 12 bits	ts + 12.5 cycles for successive approximation = 15 to 653			$1/f_{ADC}$
$I_{DDA(ADC)}$	ADC consumption from the $V_{DDA}$ supply	fs = 5 Msps	-	730	830	$\mu A$
		fs = 1 Msps	-	160	220	
		fs = 10 ksps	-	16	50	
$I_{DDV\_S(ADC)}$	ADC consumption from the $V_{REF+}$ single ended mode	fs = 5 Msps	-	130	160	$\mu A$
		fs = 1 Msps	-	30	40	
		fs = 10 ksps	-	0.6	2	
$I_{DDV\_D(ADC)}$	ADC consumption from the $V_{REF+}$ differential mode	fs = 5 Msps	-	260	310	$\mu A$
		fs = 1 Msps	-	60	70	
		fs = 10 ksps	-	1.3	3	

1. Guaranteed by design
2. The I/O analog switch voltage booster is enable when  $V_{DDA} < 2.4$  V (BOOSTEN = 1 in the SYSCFG\_CFGR1 when  $V_{DDA} < 2.4$ V). It is disable when  $V_{DDA} \geq 2.4$  V.
3.  $V_{REF+}$  can be internally connected to  $V_{DDA}$  and  $V_{REF-}$  can be internally connected to  $V_{SSA}$ , depending on the package. Refer to [Section 4: Pinouts and pin description](#) for further details.

The maximum value of  $R_{AIN}$  can be found in [Table 77](#).

Table 77. Maximum ADC  $R_{AIN}^{(1)(2)}$

Resolution	Sampling cycle @80 MHz	Sampling time [ns] @80 MHz	$R_{AIN} \text{ max } (\Omega)$	
			Fast channels <sup>(3)</sup>	Slow channels <sup>(4)</sup>
12 bits	2.5	31.25	100	N/A

**Table 80. ADC accuracy - limited test conditions 3<sup>(1)</sup>(2)(3) (continued)**

Sym-bol	Parameter	Conditions <sup>(4)</sup>		Min	Typ	Max	Unit	
THD	Total harmonic distortion	ADC clock frequency ≤ 80 MHz, Sampling rate ≤ 5.33 Msps, 1.65 V ≤ V <sub>DDA</sub> = V <sub>REF+</sub> ≤ 3.6 V, Voltage scaling Range 1	Single ended	Fast channel (max speed)	-	-69	-67	dB
				Slow channel (max speed)	-	-71	-67	
		Differential	Fast channel (max speed)	-	-72	-71		
			Slow channel (max speed)	-	-72	-71		

1. Guaranteed by design.
2. ADC DC accuracy values are measured after internal calibration.
3. ADC accuracy vs. negative Injection Current: Injecting negative current on any analog input pins should be avoided as this significantly reduces the accuracy of the conversion being performed on another analog input. It is recommended to add a Schottky diode (pin to ground) to analog pins which may potentially inject negative current.
4. The I/O analog switch voltage booster is enable when V<sub>DDA</sub> < 2.4 V (BOOSTEN = 1 in the SYSCFG\_CFGR1 when V<sub>DDA</sub> < 2.4 V). It is disable when V<sub>DDA</sub> ≥ 2.4 V. No oversampling.

Table 81. ADC accuracy - limited test conditions 4<sup>(1)(2)(3)</sup>

**Table 81. ADC accuracy - limited test conditions 4<sup>(1)</sup>(2)(3) (continued)**

Sym- bol	Parameter	Conditions <sup>(4)</sup>		Min	Typ	Max	Unit	
THD	Total harmonic distortion	ADC clock frequency ≤ 26 MHz, 1.65 V ≤ V <sub>DDA</sub> = REF+ ≤ 3.6 V, Voltage scaling Range 2	Single ended	Fast channel (max speed)	-	-71	-69	dB
				Slow channel (max speed)	-	-71	-69	
			Differential	Fast channel (max speed)	-	-73	-72	
				Slow channel (max speed)	-	-73	-72	

1. Guaranteed by design.
2. ADC DC accuracy values are measured after internal calibration.
3. ADC accuracy vs. negative Injection Current: Injecting negative current on any analog input pins should be avoided as this significantly reduces the accuracy of the conversion being performed on another analog input. It is recommended to add a Schottky diode (pin to ground) to analog pins which may potentially inject negative current.
4. The I/O analog switch voltage booster is enable when V<sub>DDA</sub> < 2.4 V (BOOSTEN = 1 in the SYSCFG\_CFGR1 when V<sub>DDA</sub> < 2.4 V). It is disable when V<sub>DDA</sub> ≥ 2.4 V. No oversampling.

Figure 35. ADC accuracy characteristics

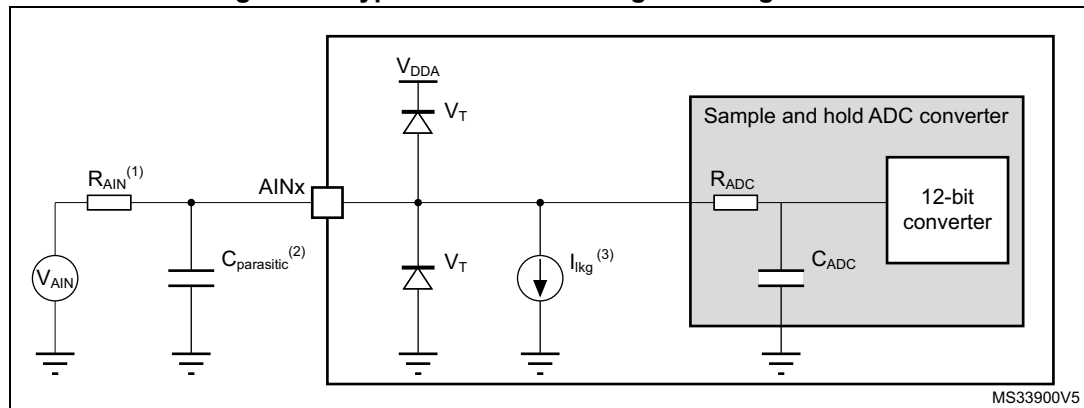

Figure 36. Typical connection diagram using the ADC

1. Refer to [Table 76: ADC characteristics](#) for the values of  $R_{AIN}$  and  $C_{ADC}$ .
2.  $C_{parasitic}$  represents the capacitance of the PCB (dependent on soldering and PCB layout quality) plus the pad capacitance (refer to [Table 70: I/O static characteristics](#) for the value of the pad capacitance). A high  $C_{parasitic}$  value downgrades conversion accuracy. To remedy this,  $f_{ADC}$  should be reduced.
3. Refer to [Table 70: I/O static characteristics](#) for the values of  $I_{kg}$ .

**General PCB design guidelines**

Power supply decoupling should be performed as shown in [Figure 22: Power supply scheme](#). The 10 nF capacitor should be ceramic (good quality) and it should be placed as close as possible to the chip.

## 6.3.19 Digital-to-Analog converter characteristics

Table 82. DAC characteristics<sup>(1)</sup>

Symbol	Parameter	Conditions	Min	Typ	Max	Unit		
V <sub>DDA</sub>	Analog supply voltage for DAC ON	DAC output buffer OFF (no resistive load on DAC1_OUTx pin or internal connection)	1.71	-	3.6	V		
		Other modes	1.80	-				
V <sub>REF+</sub>	Positive reference voltage	DAC output buffer OFF (no resistive load on DAC1_OUTx pin or internal connection)	1.71	-	V <sub>DDA</sub>			
		Other modes	1.80	-				
V <sub>REF-</sub>	Negative reference voltage	-	V <sub>SSA</sub>					
R <sub>L</sub>	Resistive load	DAC output buffer ON	connected to V <sub>SSA</sub>	5	-		-	kΩ
			connected to V <sub>DDA</sub>	25	-		-	
R <sub>O</sub>	Output Impedance	DAC output buffer OFF	9.6	11.7	13.8		kΩ	
R <sub>BON</sub>	Output impedance sample and hold mode, output buffer ON	V <sub>DD</sub> = 2.7 V	-	-	2		kΩ	
		V <sub>DD</sub> = 2.0 V	-	-	3.5			
R <sub>BOFF</sub>	Output impedance sample and hold mode, output buffer OFF	V <sub>DD</sub> = 2.7 V	-	-	16.5	kΩ		
		V <sub>DD</sub> = 2.0 V	-	-	18.0			
C <sub>L</sub>	Capacitive load	DAC output buffer ON	-	-	50	pF		
C <sub>SH</sub>		Sample and hold mode	-	0.1	1	μF		
V <sub>DAC_OUT</sub>	Voltage on DAC1_OUTx output	DAC output buffer ON	0.2	-	V <sub>REF+</sub> - 0.2	V		
		DAC output buffer OFF	0	-	V <sub>REF+</sub>			
t <sub>SETTLING</sub>	Settling time (full scale: for a 12-bit code transition between the lowest and the highest input codes when DAC1_OUTx reaches final value ±0.5LSB, ±1 LSB, ±2 LSB, ±4 LSB, ±8 LSB)	Normal mode DAC output buffer ON CL ≤ 50 pF, RL ≥ 5 kΩ	±0.5 LSB	-	1.7	3	μs	
			±1 LSB	-	1.6	2.9		
			±2 LSB	-	1.55	2.85		
			±4 LSB	-	1.48	2.8		
			±8 LSB	-	1.4	2.75		
		Normal mode DAC output buffer OFF, ±1LSB, CL = 10 pF	-	2	2.5			
t <sub>WAKEUP</sub> <sup>(2)</sup>	Wakeup time from off state (setting the ENx bit in the DAC Control register) until final value ±1 LSB	Normal mode DAC output buffer ON CL ≤ 50 pF, RL ≥ 5 kΩ	-	4.2	7.5	μs		
		Normal mode DAC output buffer OFF, CL ≤ 10 pF	-	2	5			
PSRR	V <sub>DDA</sub> supply rejection ratio	Normal mode DAC output buffer ON CL ≤ 50 pF, RL = 5 kΩ, DC	-	-80	-28	dB		

Table 82. DAC characteristics<sup>(1)</sup> (continued)

Symbol	Parameter	Conditions	Min	Typ	Max	Unit	
$T_{W\_to\_W}$	Minimal time between two consecutive writes into the DAC_DORx register to guarantee a correct DAC1_OUTx for a small variation of the input code (1 LSB) DAC_MCR:MODEx[2:0] = 000 or 001 DAC_MCR:MODEx[2:0] = 010 or 011	$CL \leq 50 \text{ pF}$ , $RL \geq 5 \text{ k}\Omega$  $CL \leq 10 \text{ pF}$	1  1.4	-	-	$\mu\text{s}$	
$t_{\text{SAMP}}$	Sampling time in sample and hold mode (code transition between the lowest input code and the highest input code when DAC1_OUTx reaches final value $\pm 1\text{LSB}$ )	DAC1_OUTx pin connected				ms	
			DAC output buffer ON, $C_{\text{SH}} = 100 \text{ nF}$	-	0.7		3.5
$I_{\text{leak}}$	Output leakage current	Sample and hold mode, DAC1_OUTx pin connected	-	-	-(3)	nA	
$C_{\text{int}}$	Internal sample and hold capacitor	-	5.2	7	8.8	pF	
$t_{\text{TRIM}}$	Middle code offset trim time	DAC output buffer ON	50	-	-	$\mu\text{s}$	
$V_{\text{offset}}$	Middle code offset for 1 trim code step	$V_{\text{REF+}} = 3.6 \text{ V}$	-	1500	-	$\mu\text{V}$	
		$V_{\text{REF+}} = 1.8 \text{ V}$	-	750	-		
$I_{\text{DDA(DAC)}}$	DAC consumption from $V_{\text{DDA}}$	DAC output buffer ON	No load, middle code (0x800)	-	315	500	$\mu\text{A}$
			No load, worst code (0xF1C)	-	450	670	
		DAC output buffer OFF	No load, middle code (0x800)	-	-	0.2	
		Sample and hold mode, $C_{\text{SH}} = 100 \text{ nF}$	-	$315 \times \frac{T_{\text{on}}}{T_{\text{on}} + T_{\text{off}}}$ <sup>(4)</sup>	$670 \times \frac{T_{\text{on}}}{T_{\text{on}} + T_{\text{off}}}$ <sup>(4)</sup>		

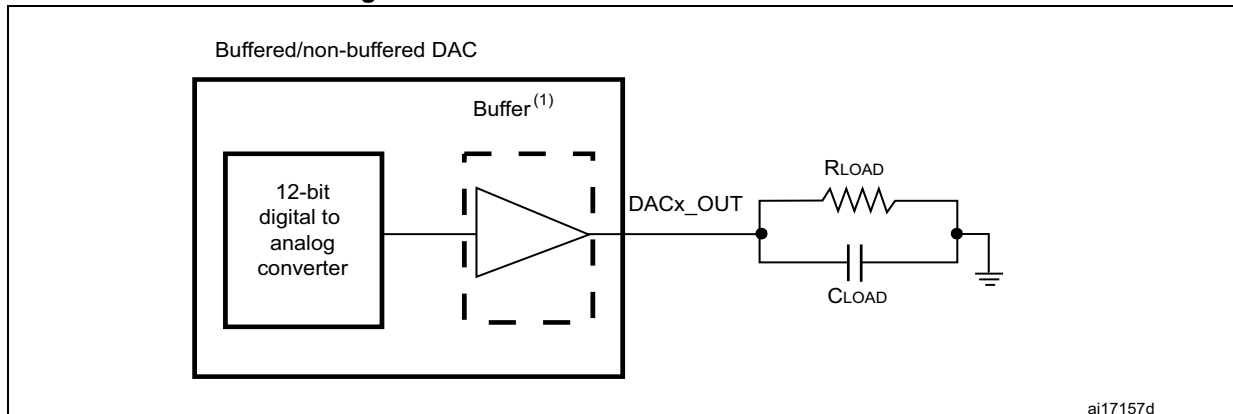

Table 82. DAC characteristics<sup>(1)</sup> (continued)

Symbol	Parameter	Conditions	Min	Typ	Max	Unit	
I <sub>DDV</sub> (DAC)	DAC consumption from V <sub>REF+</sub>	DAC output buffer ON	No load, middle code (0x800)	-	185	240	μA
			No load, worst code (0xF1C)	-	340	400	
		DAC output buffer OFF	No load, middle code (0x800)	-	155	205	
		Sample and hold mode, buffer ON, C <sub>SH</sub> = 100 nF, worst case	-	185 x Ton/(Ton + Toff) <sup>(4)</sup>	400 x Ton/(Ton + Toff) <sup>(4)</sup>		
		Sample and hold mode, buffer OFF, C <sub>SH</sub> = 100 nF, worst case	-	155 x Ton/(Ton + Toff) <sup>(4)</sup>	205 x Ton/(Ton + Toff) <sup>(4)</sup>		

1. Guaranteed by design.
2. In buffered mode, the output can overshoot above the final value for low input code (starting from min value).
3. Refer to [Table 70: I/O static characteristics](#).
4. Ton is the Refresh phase duration. Toff is the Hold phase duration. Refer to RM0351 reference manual for more details.

Figure 37. 12-bit buffered / non-buffered DAC

1. The DAC integrates an output buffer that can be used to reduce the output impedance and to drive external loads directly without the use of an external operational amplifier. The buffer can be bypassed by configuring the BOFFx bit in the DAC\_CR register.

Table 83. DAC accuracy<sup>(1)</sup>

Symbol	Parameter	Conditions	Min	Typ	Max	Unit	
DNL	Differential non linearity <sup>(2)</sup>	DAC output buffer ON	-	-	±2	LSB	
		DAC output buffer OFF	-	-	±2		
-	monotonicity	10 bits	guaranteed				
INL	Integral non linearity <sup>(3)</sup>	DAC output buffer ON CL ≤ 50 pF, RL ≥ 5 kΩ	-	-	±4		
		DAC output buffer OFF CL ≤ 50 pF, no RL	-	-	±4		
Offset	Offset error at code 0x800 <sup>(3)</sup>	DAC output buffer ON CL ≤ 50 pF, RL ≥ 5 kΩ	V <sub>REF+</sub> = 3.6 V	-	-		±12
			V <sub>REF+</sub> = 1.8 V	-	-		±25
		DAC output buffer OFF CL ≤ 50 pF, no RL		-	-		±8
Offset1	Offset error at code 0x001 <sup>(4)</sup>	DAC output buffer OFF CL ≤ 50 pF, no RL	-	-	±5		
OffsetCal	Offset Error at code 0x800 after calibration	DAC output buffer ON CL ≤ 50 pF, RL ≥ 5 kΩ	V <sub>REF+</sub> = 3.6 V	-	-	±5	
			V <sub>REF+</sub> = 1.8 V	-	-	±7	
Gain	Gain error <sup>(5)</sup>	DAC output buffer ON CL ≤ 50 pF, RL ≥ 5 kΩ	-	-	±0.5	%	
		DAC output buffer OFF CL ≤ 50 pF, no RL	-	-	±0.5		
TUE	Total unadjusted error	DAC output buffer ON CL ≤ 50 pF, RL ≥ 5 kΩ	-	-	±30	LSB	
		DAC output buffer OFF CL ≤ 50 pF, no RL	-	-	±12		
TUECal	Total unadjusted error after calibration	DAC output buffer ON CL ≤ 50 pF, RL ≥ 5 kΩ	-	-	±23	LSB	
SNR	Signal-to-noise ratio	DAC output buffer ON CL ≤ 50 pF, RL ≥ 5 kΩ 1 kHz, BW 500 kHz	-	71.2	-	dB	
		DAC output buffer OFF CL ≤ 50 pF, no RL, 1 kHz BW 500 kHz	-	71.6	-		
THD	Total harmonic distortion	DAC output buffer ON CL ≤ 50 pF, RL ≥ 5 kΩ, 1 kHz	-	-78	-	dB	
		DAC output buffer OFF CL ≤ 50 pF, no RL, 1 kHz	-	-79	-		

Table 83. DAC accuracy<sup>(1)</sup> (continued)

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
SINAD	Signal-to-noise and distortion ratio	DAC output buffer ON CL ≤ 50 pF, RL ≥ 5 kΩ, 1 kHz	-	70.4	-	dB
		DAC output buffer OFF CL ≤ 50 pF, no RL, 1 kHz	-	71	-	
ENOB	Effective number of bits	DAC output buffer ON CL ≤ 50 pF, RL ≥ 5 kΩ, 1 kHz	-	11.4	-	bits
		DAC output buffer OFF CL ≤ 50 pF, no RL, 1 kHz	-	11.5	-	

1. Guaranteed by design.
2. Difference between two consecutive codes - 1 LSB.
3. Difference between measured value at Code i and the value at Code i on a line drawn between Code 0 and last Code 4095.
4. Difference between the value measured at Code (0x001) and the ideal value.
5. Difference between ideal slope of the transfer function and measured slope computed from code 0x000 and 0xFF when buffer is OFF, and from code giving 0.2 V and ( $V_{REF+} - 0.2$ ) V when buffer is ON.

## 6.3.20 Voltage reference buffer characteristics

Table 84. VREFBUF characteristics<sup>(1)</sup>

Symbol	Parameter	Conditions		Min	Typ	Max	Unit
$V_{DDA}$	Analog supply voltage	Normal mode	$V_{RS} = 0$	2.4	-	3.6	V
			$V_{RS} = 1$	2.8	-	3.6	
		Degraded mode <sup>(2)</sup>	$V_{RS} = 0$	1.65	-	2.4	
			$V_{RS} = 1$	1.65	-	2.8	
$V_{REFBUF\_OUT}$	Voltage reference output	Normal mode	$V_{RS} = 0$	2.046 <sup>(3)</sup>	2.048	2.049 <sup>(3)</sup>	
			$V_{RS} = 1$	2.498 <sup>(3)</sup>	2.5	2.502 <sup>(3)</sup>	
		Degraded mode <sup>(2)</sup>	$V_{RS} = 0$	$V_{DDA} - 150 \text{ mV}$	-	$V_{DDA}$	
			$V_{RS} = 1$	$V_{DDA} - 150 \text{ mV}$	-	$V_{DDA}$	
TRIM	Trim step resolution	-	-	-	$\pm 0.05$	$\pm 0.1$	%
CL	Load capacitor	-	-	0.5	1	1.5	$\mu\text{F}$
esr	Equivalent series resistor of Cload	-	-	-	-	2	$\Omega$
$I_{load}$	Static load current	-	-	-	-	4	mA
$I_{line\_reg}$	Line regulation	$2.8 \text{ V} \leq V_{DDA} \leq 3.6 \text{ V}$	$I_{load} = 500 \mu\text{A}$	-	200	1000	ppm/V
			$I_{load} = 4 \text{ mA}$	-	100	500	
$I_{load\_reg}$	Load regulation	$500 \mu\text{A} \leq I_{load} \leq 4 \text{ mA}$	Normal mode	-	50	500	ppm/mA
$T_{Coeff}$	Temperature coefficient	$-40 \text{ }^\circ\text{C} < T_J < +125 \text{ }^\circ\text{C}$		-	-	$T_{coeff\_vrefint} + 50$	ppm/ $^\circ\text{C}$
		$0 \text{ }^\circ\text{C} < T_J < +50 \text{ }^\circ\text{C}$		-	-	$T_{coeff\_vrefint} + 50$	
PSRR	Power supply rejection	DC		40	60	-	dB
		100 kHz		25	40	-	
$t_{START}$	Start-up time	$CL = 0.5 \mu\text{F}^{(4)}$		-	300	350	$\mu\text{s}$
		$CL = 1.1 \mu\text{F}^{(4)}$		-	500	650	
		$CL = 1.5 \mu\text{F}^{(4)}$		-	650	800	
$I_{INRUSH}$	Control of maximum DC current drive on VREFBUF_OUT during start-up phase <sup>(5)</sup>	-	-	-	8	-	mA

Table 84. VREFBUF characteristics<sup>(1)</sup> (continued)

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$I_{DDA}(VREFBUF)$	VREFBUF consumption from $V_{DDA}$	$I_{load} = 0 \mu A$	-	16	25	$\mu A$
		$I_{load} = 500 \mu A$	-	18	30	
		$I_{load} = 4 mA$	-	35	50	

1. Guaranteed by design, unless otherwise specified.
2. In degraded mode, the voltage reference buffer can not maintain accurately the output voltage which therefore follows ( $V_{DDA}$  - drop voltage).
3. Guaranteed by test in production.
4. The capacitive load must include a 100 nF capacitor in order to cut-off the high frequency noise.
5. To correctly control the VREFBUF inrush current during start-up phase and scaling change, the  $V_{DDA}$  voltage should be in the range [2.4 V to 3.6 V] and [2.8 V to 3.6 V] respectively for  $V_{RS} = 0$  and  $V_{RS} = 1$ .

6.3.21 Comparator characteristics

Table 85. COMP characteristics<sup>(1)</sup>

Symbol	Parameter	Conditions	Min	Typ	Max	Unit	
$V_{DDA}$	Analog supply voltage	-	1.62	-	3.6	V	
$V_{IN}$	Comparator input voltage range	-	0	-	$V_{DDA}$		
$V_{BG}^{(2)}$	Scaler input voltage	-	$V_{REFINT}$				
$V_{SC}$	Scaler offset voltage	-	-	$\pm 5$	$\pm 10$	mV	
$I_{DDA(SCALER)}$	Scaler static consumption from $V_{DDA}$	BRG_EN=0 (bridge disable)	-	200	300	nA	
		BRG_EN=1 (bridge enable)	-	0.8	1	$\mu A$	
$t_{START\_SCALER}$	Scaler startup time	-	-	100	200	$\mu s$	
$t_{START}$	Comparator startup time to reach propagation delay specification	High-speed mode	$V_{DDA} \geq 2.7 V$	-	-	5	$\mu s$
			$V_{DDA} < 2.7 V$	-	-	7	
		Medium mode	$V_{DDA} \geq 2.7 V$	-	-	15	
			$V_{DDA} < 2.7 V$	-	-	25	
Ultra-low-power mode		-	-	80			
$t_D^{(3)}$	Propagation delay for 200 mV step with 100 mV overdrive	High-speed mode	$V_{DDA} \geq 2.7 V$	-	55	80	ns
			$V_{DDA} < 2.7 V$	-	65	100	
		Medium mode	$V_{DDA} \geq 2.7 V$	-	0.55	0.9	$\mu s$
			$V_{DDA} < 2.7 V$	-	0.65	1	
Ultra-low-power mode		-	5	12			
$V_{offset}$	Comparator offset error	Full common mode range	-	$\pm 5$	$\pm 20$	mV	
$V_{hys}$	Comparator hysteresis	No hysteresis		-	0	-	mV
		Low hysteresis		4	8	16	
		Medium hysteresis		8	15	30	
		High hysteresis		15	27	52	

Table 85. COMP characteristics<sup>(1)</sup> (continued)

Symbol	Parameter	Conditions		Min	Typ	Max	Unit
I <sub>DDA</sub> (COMP)	Comparator consumption from V <sub>DDA</sub>	Ultra-low-power mode	Static	-	400	600	nA
			With 50 kHz ±100 mV overdrive square signal	-	1200	-	
		Medium mode	Static	-	5	7	µA
			With 50 kHz ±100 mV overdrive square signal	-	6	-	
		High-speed mode	Static	-	70	100	
			With 50 kHz ±100 mV overdrive square signal	-	75	-	
I <sub>bias</sub>	Comparator input bias current	-		-	-	-(4)	nA

1. Guaranteed by design, unless otherwise specified.
2. Refer to [Table 25: Embedded internal voltage reference](#).
3. Guaranteed by characterization results.
4. Mostly I/O leakage when used in analog mode. Refer to I<sub>Ikg</sub> parameter in [Table 70: I/O static characteristics](#).

### 6.3.22 Operational amplifiers characteristics

Table 86. OPAMP characteristics<sup>(1)</sup>

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
V <sub>DDA</sub>	Analog supply voltage	-	1.8	-	3.6	V
CMIR	Common mode input range	-	0	-	V <sub>DDA</sub>	V
V <sub>I</sub> OFFSET	Input offset voltage	25 °C, No Load on output.	-	-	±1.5	mV
		All voltage/Temp.	-	-	±3	
ΔV <sub>I</sub> OFFSET	Input offset voltage drift	Normal mode	-	±5	-	µV/°C
		Low-power mode	-	±10	-	
TRIMOFFSETP TRIMLPOFFSETP	Offset trim step at low common input voltage (0.1 × V <sub>DDA</sub> )	-	-	0.8	1.1	mV
TRIMOFFSETN TRIMLPOFFSETN	Offset trim step at high common input voltage (0.9 × V <sub>DDA</sub> )	-	-	1	1.35	

Table 86. OPAMP characteristics<sup>(1)</sup> (continued)

Symbol	Parameter	Conditions		Min	Typ	Max	Unit
I <sub>LOAD</sub>	Drive current	Normal mode	V <sub>DDA</sub> ≥ 2 V	-	-	500	μA
		Low-power mode		-	-	100	
I <sub>LOAD_PGA</sub>	Drive current in PGA mode	Normal mode	V <sub>DDA</sub> ≥ 2 V	-	-	450	
		Low-power mode		-	-	50	
R <sub>LOAD</sub>	Resistive load (connected to VSSA or to VDDA)	Normal mode	V <sub>DDA</sub> < 2 V	4	-	-	kΩ
		Low-power mode		20	-	-	
R <sub>LOAD_PGA</sub>	Resistive load in PGA mode (connected to VSSA or to VDDA)	Normal mode	V <sub>DDA</sub> < 2 V	4.5	-	-	
		Low-power mode		40	-	-	
C <sub>LOAD</sub>	Capacitive load	-		-	-	50	pF
CMRR	Common mode rejection ratio	Normal mode		-	-85	-	dB
		Low-power mode		-	-90	-	
PSRR	Power supply rejection ratio	Normal mode	C <sub>LOAD</sub> ≤ 50 pf, R <sub>LOAD</sub> ≥ 4 kΩ DC	70	85	-	dB
		Low-power mode	C <sub>LOAD</sub> ≤ 50 pf, R <sub>LOAD</sub> ≥ 20 kΩ DC	72	90	-	
GBW	Gain Bandwidth Product	Normal mode	V <sub>DDA</sub> ≥ 2.4 V (OPA_RANGE = 1)	550	1600	2200	kHz
		Low-power mode		100	420	600	
		Normal mode	V <sub>DDA</sub> < 2.4 V (OPA_RANGE = 0)	250	700	950	
		Low-power mode		40	180	280

**Table 86. OPAMP characteristics<sup>(1)</sup> (continued)**

Symbol	Parameter	Conditions		Min	Typ	Max	Unit
en	Voltage noise density	Normal mode	at 1 kHz, Output loaded with 4 kΩ	-	500	-	nV/√Hz
		Low-power mode	at 1 kHz, Output loaded with 20 kΩ	-	600	-	
		Normal mode	at 10 kHz, Output loaded with 4 kΩ	-	180	-	
		Low-power mode	at 10 kHz, Output loaded with 20 kΩ	-	290	-	
I <sub>DDA</sub> (OPAMP) <sup>(2)</sup>	OPAMP consumption from V <sub>DDA</sub>	Normal mode	no Load, quiescent mode	-	120	260	μA
		Low-power mode		-	45	100	

1. Guaranteed by design, unless otherwise specified.
2. Guaranteed by characterization results.
3. Mostly I/O leakage, when used in analog mode. Refer to I<sub>Ikg</sub> parameter in [Table 70: I/O static characteristics](#).
4. R2 is the internal resistance between OPAMP output and OPAMP inverting input. R1 is the internal resistance between OPAMP inverting input and ground. The PGA gain = 1+R2/R1

### 6.3.23 Temperature sensor characteristics

**Table 87. TS characteristics**

Symbol	Parameter	Min	Typ	Max	Unit
T <sub>L</sub> <sup>(1)</sup>	V <sub>TS</sub> linearity with temperature	-	±1	±2	°C
Avg_Slope <sup>(2)</sup>	Average slope	2.3	2.5	2.7	mV/°C
V <sub>30</sub>	Voltage at 30°C (±5 °C) <sup>(3)</sup>	0.742	0.76	0.785	V
t <sub>START</sub> (TS_BUF) <sup>(1)</sup>	Sensor Buffer Start-up time in continuous mode <sup>(4)</sup>	-	8	15	μs
t <sub>START</sub> <sup>(1)</sup>	Start-up time when entering in continuous mode <sup>(4)</sup>	-	70	120	μs
t <sub>S_temp</sub> <sup>(1)</sup>	ADC sampling time when reading the temperature	5	-	-	μs
I <sub>DD</sub> (TS) <sup>(1)</sup>	Temperature sensor consumption from V <sub>DD</sub> , when selected by ADC	-	4.7	7	μA

1. Guaranteed by design.
2. Guaranteed by characterization results.
3. Measured at V<sub>DDA</sub> = 3.0 V ±10 mV. The V<sub>30</sub> ADC conversion result is stored in the TS\_CAL1 byte. Refer to [Table 8: Temperature sensor calibration values](#).
4. Continuous mode means Run/Sleep modes, or temperature sensor enable in Low-power run/Low-power sleep modes.

### 6.3.24 $V_{BAT}$ monitoring characteristics

**Table 88.  $V_{BAT}$  monitoring characteristics**

Symbol	Parameter	Min	Typ	Max	Unit
R	Resistor bridge for $V_{BAT}$	-	3×39	-	k $\Omega$
Q	Ratio on $V_{BAT}$ measurement	-	3	-	-
$E_r^{(1)}$	Error on Q	-10	-	10	%
$t_{S\_vbat}^{(1)}$	ADC sampling time when reading the $V_{BAT}$	12	-	-	$\mu$ s

1. Guaranteed by design.

**Table 89.  $V_{BAT}$  charging characteristics**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$R_{BC}$	Battery charging resistor	VBRS = 0	-	5	-	k $\Omega$
		VBRS = 1	-	1.5	-	

### 6.3.25 LCD controller characteristics

The devices embed a built-in step-up converter to provide a constant LCD reference voltage independently from the  $V_{DD}$  voltage. An external capacitor  $C_{ext}$  must be connected to the VLCD pin to decouple this converter.

**Table 90. LCD controller characteristics<sup>(1)</sup>**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$V_{LCD}$	LCD external voltage		-	-	3.6	V
$V_{LCD0}$	LCD internal reference voltage 0		-	2.62	-	
$V_{LCD1}$	LCD internal reference voltage 1		-	2.76	-	
$V_{LCD2}$	LCD internal reference voltage 2		-	2.89	-	
$V_{LCD3}$	LCD internal reference voltage 3		-	3.04	-	
$V_{LCD4}$	LCD internal reference voltage 4		-	3.19	-	
$V_{LCD5}$	LCD internal reference voltage 5		-	3.32	-	
$V_{LCD6}$	LCD internal reference voltage 6		-	3.46	-	
$V_{LCD7}$	LCD internal reference voltage 7		-	3.62	-	
$C_{ext}$	$V_{LCD}$ external capacitance	Buffer OFF (BUFEN=0 is LCD_CR register)	0.2	-	2	$\mu$ F
		Buffer ON (BUFEN=1 is LCD_CR register)	1	-	2	
$I_{LCD}^{(2)}$	Supply current from $V_{DD}$ at $V_{DD} = 2.2$ V	Buffer OFF (BUFEN=0 is LCD_CR register)	-	3	-	$\mu$ A
	Supply current from $V_{DD}$ at $V_{DD} = 3.0$ V	Buffer OFF (BUFEN=0 is LCD_CR register)	-	1.5	-	

Table 90. LCD controller characteristics<sup>(1)</sup> (continued)

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
I <sub>VLCD</sub>	Supply current from V <sub>LCD</sub> (V <sub>LCD</sub> = 3 V)	Buffer OFF (BUFFEN = 0, PON = 0)	-	0.5	-	μA
		Buffer ON (BUFFEN = 1, 1/2 Bias)	-	0.6	-	
		Buffer ON (BUFFEN = 1, 1/3 Bias)	-	0.8	-	
		Buffer ON (BUFFEN = 1, 1/4 Bias)	-	1	-	
R <sub>HN</sub>	Total High resistor value for Low drive resistive network	-	5.5	-	MΩ	
R <sub>LN</sub>	Total Low resistor value for High drive resistive network	-	240	-	kΩ	
V <sub>44</sub>	Segment/Common highest level voltage	-	V <sub>LCD</sub>	-	V	
V <sub>34</sub>	Segment/Common 3/4 level voltage	-	3/4 V <sub>LCD</sub>	-		
V <sub>23</sub>	Segment/Common 2/3 level voltage	-	2/3 V <sub>LCD</sub>	-		
V <sub>12</sub>	Segment/Common 1/2 level voltage	-	1/2 V <sub>LCD</sub>	-		
V <sub>13</sub>	Segment/Common 1/3 level voltage	-	1/3 V <sub>LCD</sub>	-		
V <sub>14</sub>	Segment/Common 1/4 level voltage	-	1/4 V <sub>LCD</sub>	-		
V <sub>0</sub>	Segment/Common lowest level voltage	-	0	-		

- Guaranteed by design.
- LCD enabled with 3 V internal step-up active, 1/8 duty, 1/4 bias, division ratio= 64, all pixels active, no LCD connected.

### 6.3.26 DFSDM characteristics

Unless otherwise specified, the parameters given in [Table 91](#) for DFSDM are derived from tests performed under the ambient temperature, f<sub>APB2</sub> frequency and V<sub>DD</sub> supply voltage conditions summarized in [Table 22: General operating conditions](#).

- Output speed is set to OSPEEDRy[1:0] = 10
- Capacitive load C = 30 pF
- Measurement points are done at CMOS levels: 0.5 x VDD

Refer to [Section 6.3.14: I/O port characteristics](#) for more details on the input/output alternate function characteristics (DFSDM1\_CKINy, DFSDM1\_DATINy, DFSDM1\_CKOUT for DFSDM).

Table 91. DFSDM characteristics<sup>(1)</sup>

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
f <sub>DFSDMCLK</sub>	DFSDM clock	-	-	-	f <sub>SYSCLK</sub>	MHz
f <sub>CKIN</sub> (1/T <sub>CKIN</sub> )	Input clock frequency	SPI mode (SITP[1:0] = 01)	-	-	20 (f <sub>DFSDMCLK</sub> /4)	
f <sub>CKOUT</sub>	Output clock frequency	-	-	-	20	

Table 91. DFSDM characteristics<sup>(1)</sup> (continued)

Symbol	Parameter	Conditions	Min	Typ	Max	Unit	
DuCy <sub>CKOUT</sub>	Output clock frequency duty cycle	1.62 < V <sub>DD</sub> < 3.6 V	Even division CKOUTDIV[7:0] = n 1,3,5,..	45	50	55	%
			Odd division CKOUTDIV[7:0] = n 2,4,6,..	$\frac{((n/2+1)/(n+1)) \times 100}{-5}$	$\frac{((n/2+1)/(n+1)) \times 100}{-5}$	$\frac{((n/2+1)/(n+1)) \times 100}{+5}$	
t <sub>wh(CKIN)</sub> t <sub>wl(CKIN)</sub>	Input clock high and low time	SPI mode (SITP[1:0] = 01), External clock mode (SPICKSEL[1:0] = 0)	T <sub>CKIN</sub> / 2 - 0.5	T <sub>CKIN</sub> / 2	-	ns	
t <sub>su</sub>	Data input setup time	SPI mode (SITP[1:0] = 01), External clock mode (SPICKSEL[1:0] = 0)	2	-	-		
t <sub>h</sub>	Data input hold time	SPI mode (SITP[1:0] = 01), External clock mode (SPICKSEL[1:0] = 0)	0	-	-		
T <sub>Manchester</sub>	Manchester data period (recovered clock period)	Manchester mode (SITP[1:0] = 10 or 11), Internal clock mode (SPICKSEL[1:0] ≠ 0)	(CKOUT DIV+1) x T <sub>DFSDMCLK</sub>	-	2 x CKOUT DIV x T <sub>DFSDMCLK</sub>		

1. Data based on characterization results, not tested in production.

Figure 16: DFSDM timing diagram

### 6.3.27 Timer characteristics

The parameters given in the following tables are guaranteed by design.

Refer to [Section 6.3.14: I/O port characteristics](#) for details on the input/output alternate function characteristics (output compare, input capture, external clock, PWM output).

**Table 92. TIMx<sup>(1)</sup> characteristics**

Symbol	Parameter	Conditions	Min	Max	Unit
t <sub>res(TIM)</sub>	Timer resolution time	-	1	-	t <sub>TIMxCLK</sub>
		f <sub>TIMxCLK</sub> = 80 MHz	12.5	-	ns
f <sub>EXT</sub>	Timer external clock frequency on CH1 to CH4	-	0	f <sub>TIMxCLK</sub> /2	MHz
		f <sub>TIMxCLK</sub> = 80 MHz	0	40	MHz
Res <sub>TIM</sub>	Timer resolution	TIMx (except TIM2 and TIM5)	-	16	bit
		TIM2 and TIM5	-	32	
t <sub>COUNTER</sub>	16-bit counter clock period	-	1	65536	t <sub>TIMxCLK</sub>
		f <sub>TIMxCLK</sub> = 80 MHz	0.0125	819.2	μs
t <sub>MAX_COUNT</sub>	Maximum possible count with 32-bit counter	-	-	65536 × 65536	t <sub>TIMxCLK</sub>
		f <sub>TIMxCLK</sub> = 80 MHz	-	53.68	s

1. TIMx is used as a general term in which x stands for 1,2,3,4,5,6,7,8,15,16 or 17.

**Table 93. IWDG min/max timeout period at 32 kHz (LSI)<sup>(1)</sup>**

Prescaler divider	PR[2:0] bits	Min timeout RL[11:0]= 0x000	Max timeout RL[11:0]= 0xFFFF	Unit
/4	0	0.125	512	ms
/8	1	0.250	1024	
/16	2	0.500	2048	
/32	3	1.0	4096	
/64	4	2.0	8192	
/128	5	4.0	16384	
/256	6 or 7	8.0	32768	

1. The exact timings still depend on the phasing of the APB interface clock versus the LSI clock so that there is always a full RC period of uncertainty.

**Table 94. WWDG min/max timeout value at 80 MHz (PCLK)**

Prescaler	WDGTB	Min timeout value	Max timeout value	Unit
1	0	0.0512	3.2768	ms
2	1	0.1024	6.5536	
4	2	0.2048	13.1072	
8	3	0.4096	26.2144	

## 6.3.28 Communication interfaces characteristics

### I<sup>2</sup>C interface characteristics

The I2C interface meets the timings requirements of the I<sup>2</sup>C-bus specification and user manual rev. 03 for:

- Standard-mode (Sm): with a bit rate up to 100 kbit/s
- Fast-mode (Fm): with a bit rate up to 400 kbit/s
- Fast-mode Plus (Fm+): with a bit rate up to 1 Mbit/s.

The I2C timings requirements are guaranteed by design when the I2C peripheral is properly configured (refer to RM0351 reference manual).

The SDA and SCL I/O requirements are met with the following restrictions: the SDA and SCL I/O pins are not “true” open-drain. When configured as open-drain, the PMOS connected between the I/O pin and  $V_{DDIOx}$  is disabled, but is still present. Only FT\_f I/O pins support Fm+ low level output current maximum requirement. Refer to [Section 6.3.14: I/O port characteristics](#) for the I2C I/Os characteristics.

All I2C SDA and SCL I/Os embed an analog filter. Refer to the table below for the analog filter characteristics:

**Table 95. I2C analog filter characteristics<sup>(1)</sup>**

Symbol	Parameter	Min	Max	Unit
$t_{AF}$	Maximum pulse width of spikes that are suppressed by the analog filter	50 <sup>(2)</sup>	260 <sup>(3)</sup>	ns

1. Guaranteed by design.
2. Spikes with widths below  $t_{AF(min)}$  are filtered.
3. Spikes with widths above  $t_{AF(max)}$  are not filtered

### SPI characteristics

Unless otherwise specified, the parameters given in [Table 96](#) for SPI are derived from tests performed under the ambient temperature,  $f_{PCLKx}$  frequency and supply voltage conditions summarized in [Table 22: General operating conditions](#).

- Output speed is set to OSPEEDRy[1:0] = 11
- Capacitive load C = 30 pF
- Measurement points are done at CMOS levels:  $0.5 \times V_{DD}$

Refer to [Section 6.3.14: I/O port characteristics](#) for more details on the input/output alternate function characteristics (NSS, SCK, MOSI, MISO for SPI).

Table 96. SPI characteristics<sup>(1)</sup>

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$f_{SCK}$ $1/t_{c(SCK)}$	SPI clock frequency	Master mode receiver/full duplex 2.7 V < V <sub>DD</sub> < 3.6 V Voltage Range 1	-	-	40	MHz
		Master mode receiver/full duplex 1.71 V < V <sub>DD</sub> < 3.6 V Voltage Range 1			16	
		Master mode transmitter 1.71 V < V <sub>DD</sub> < 3.6 V Voltage Range 1			40	
		Slave mode receiver 1.71 V < V <sub>DD</sub> < 3.6 V Voltage Range 1			40	
		Slave mode transmitter/full duplex 2.7 V < V <sub>DD</sub> < 3.6 V Voltage Range 1			31 <sup>(2)</sup>	
		Slave mode transmitter/full duplex 1.71 V < V <sub>DD</sub> < 3.6 V Voltage Range 1			18.5 <sup>(2)</sup>	
		Voltage Range 2			13	
		1.08 V < V <sub>DDIO2</sub> < 1.32 V <sup>(3)</sup>			8	
$t_{su(NSS)}$	NSS setup time	Slave mode, SPI prescaler = 2	4×T <sub>PCLK</sub>	-	-	ns
$t_{h(NSS)}$	NSS hold time	Slave mode, SPI prescaler = 2	2×T <sub>PCLK</sub>	-	-	ns
$t_{w(SCKH)}$ $t_{w(SCKL)}$	SCK high and low time	Master mode	T <sub>PCLK</sub> -2	T <sub>PCLK</sub>	T <sub>PCLK</sub> +2	ns
$t_{su(MI)}$	Data input setup time	Master mode	1	-	-	ns
$t_{su(SI)}$		Slave mode	1.5	-	-	
$t_{h(MI)}$	Data input hold time	Master mode	5	-	-	ns
$t_{h(SI)}$		Slave mode	1.5	-	-	
$t_{a(SO)}$	Data output access time	Slave mode	9	-	34	ns
$t_{dis(SO)}$	Data output disable time	Slave mode	9	-	16	ns
$t_{v(SO)}$	Data output valid time	Slave mode 2.7 V < V <sub>DD</sub> < 3.6 V Voltage Range 1	-	13	15.5	ns
-		Slave mode 1.71 V < V <sub>DD</sub> < 3.6 V Voltage Range 1	-	13	26.5	
-		Slave mode 1.71 V < V <sub>DD</sub> < 3.6 V Voltage Range 2	-	13	30	
-		Slave mode 1.08 V < V <sub>DDIO2</sub> < 1.32 V <sup>(3)</sup>	-	26	60	
$t_{v(MO)}$	Data output hold time	Master mode	-	4.5	6	ns
$t_{h(SO)}$		Slave mode 1.71 V < V <sub>DD</sub> < 3.6 V	7	-	-	
$t_{h(MO)}$		Master mode	0	-	-	

1. Guaranteed by characterization results.
2. Maximum frequency in Slave transmitter mode is determined by the sum of  $t_{v(SO)}$  and  $t_{su(MI)}$  which has to fit into SCK low or high phase preceding the SCK sampling edge. This value can be achieved when the SPI communicates with a master having  $t_{su(MI)} = 0$  while  $Duty(SCK) = 50\%$ .
3. SPI mapped on Port G.

Figure 38. SPI timing diagram - slave mode and CPHA = 0

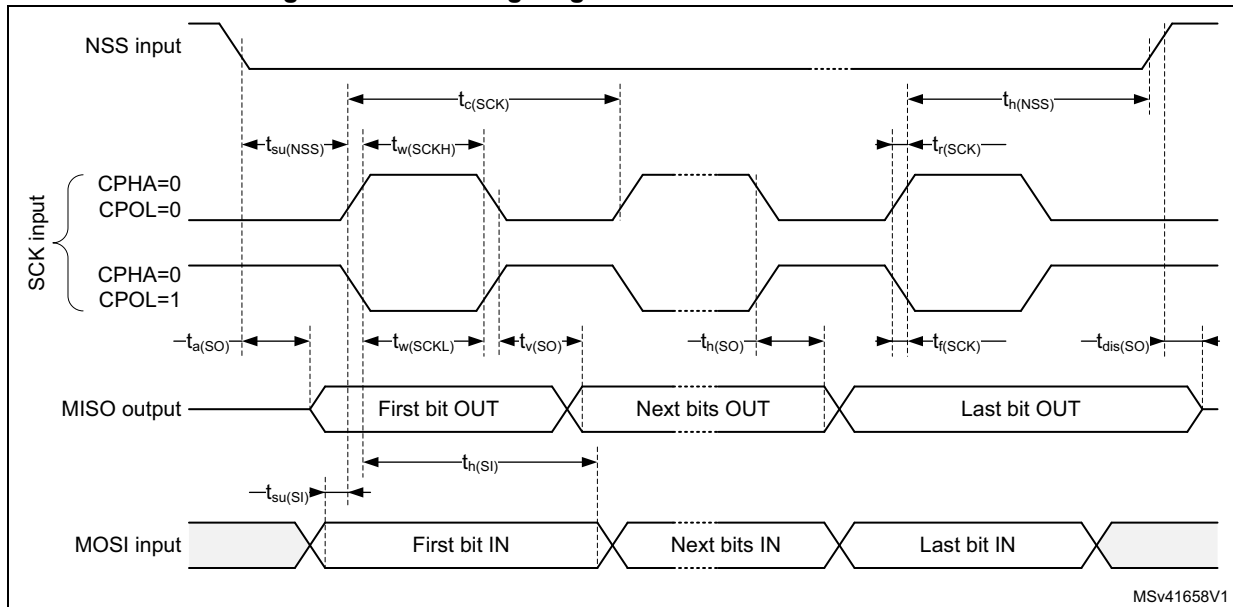

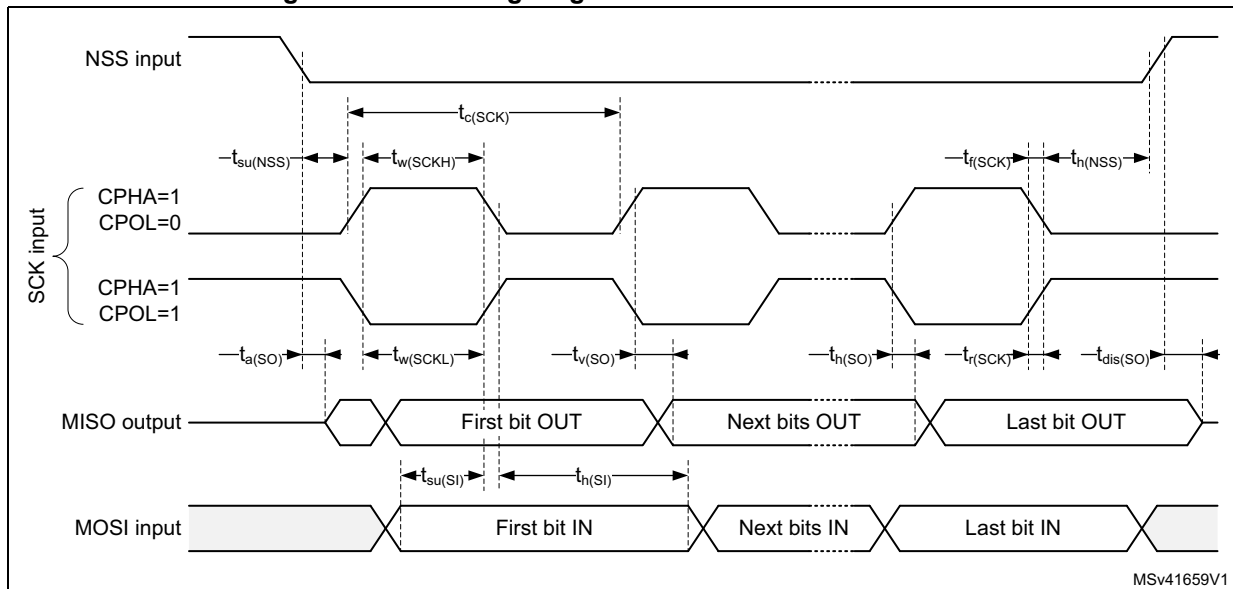

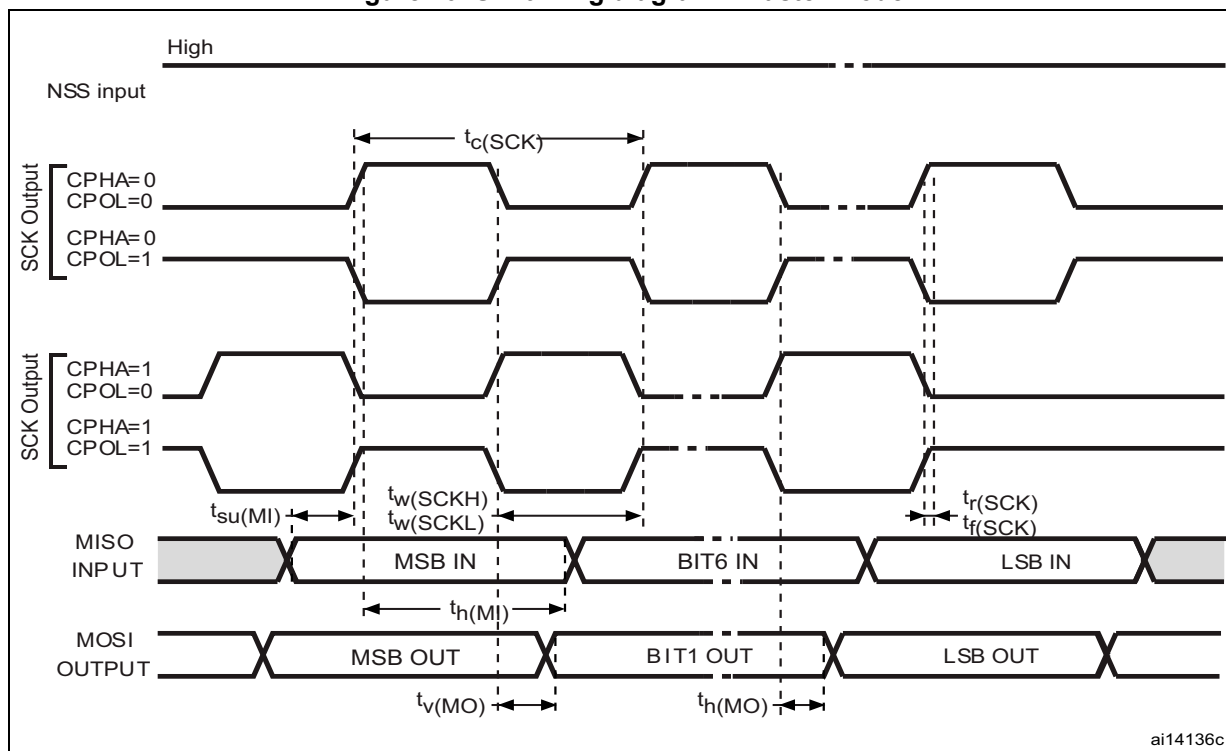

Figure 39. SPI timing diagram - slave mode and CPHA = 1

1. Measurement points are done at CMOS levels:  $0.3 V_{DD}$  and  $0.7 V_{DD}$ .

Figure 40. SPI timing diagram - master mode

1. Measurement points are done at CMOS levels: 0.3  $V_{DD}$  and 0.7  $V_{DD}$ .

**Quad SPI characteristics**

Unless otherwise specified, the parameters given in [Table 97](#) and [Table 98](#) for Quad SPI are derived from tests performed under the ambient temperature,  $f_{AHB}$  frequency and  $V_{DD}$  supply voltage conditions summarized in [Table 22: General operating conditions](#), with the following configuration:

- Output speed is set to OSPEEDRy[1:0] = 11
- Capacitive load C = 15 or 20 pF
- Measurement points are done at CMOS levels:  $0.5 \times V_{DD}$

Refer to [Section 6.3.14: I/O port characteristics](#) for more details on the input/output alternate function characteristics.

**Table 97. Quad SPI characteristics in SDR mode<sup>(1)</sup>**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$F_{CK}$ $1/t_{(CK)}$	Quad SPI clock frequency	$1.71\text{ V} < V_{DD} < 3.6\text{ V}$ , $C_{LOAD} = 20\text{ pF}$ Voltage Range 1	-	-	40	MHz
		$1.71\text{ V} < V_{DD} < 3.6\text{ V}$ , $C_{LOAD} = 15\text{ pF}$ Voltage Range 1	-	-	48	
		$2.7\text{ V} < V_{DD} < 3.6\text{ V}$ , $C_{LOAD} = 15\text{ pF}$ Voltage Range 1	-	-	60	
		$1.71\text{ V} < V_{DD} < 3.6\text{ V}$ , $C_{LOAD} = 20\text{ pF}$ Voltage Range 2	-	-	26	

**Table 97. Quad SPI characteristics in SDR mode<sup>(1)</sup> (continued)**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$t_{w(CKH)}$	Quad SPI clock high and low time	$f_{AHBCLK} = 48 \text{ MHz, presc} = 0$	$t_{CK}/2$	-	$t_{CK}/2+1$	ns
$t_{w(CKL)}$			$t_{CK}/2-1$	-	$t_{CK}/2$	
$t_{s(IN)}$	Data input setup time	Voltage Range 1	1.5	-	-	
		Voltage Range 2	3.5	-	-	
$t_{h(IN)}$	Data input hold time	Voltage Range 1	4	-	-	
		Voltage Range 2	6.5	-	-	
$t_{v(OUT)}$	Data output valid time	Voltage Range 1	-	1	1.5	
		Voltage Range 2	-	3	5	
$t_{h(OUT)}$	Data output hold time	Voltage Range 1	0	-	-	
		Voltage Range 2	0	-	-	

1. Guaranteed by characterization results.

**Table 98. QUADSPI characteristics in DDR mode<sup>(1)</sup>**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$F_{CK}$ $1/t_{(CK)}$	Quad SPI clock frequency	$1.71 \text{ V} < V_{DD} < 3.6 \text{ V}$ , $C_{LOAD} = 20 \text{ pF}$ Voltage Range 1	-	-	40	MHz
		$2 \text{ V} < V_{DD} < 3.6 \text{ V}$ , $C_{LOAD} = 20 \text{ pF}$ Voltage Range 1	-	-	48	
		$1.71 \text{ V} < V_{DD} < 3.6 \text{ V}$ , $C_{LOAD} = 15 \text{ pF}$ Voltage Range 1	-	-	48	
		$1.71 \text{ V} < V_{DD} < 3.6 \text{ V}$ $C_{LOAD} = 20 \text{ pF}$ Voltage Range 2	-	-	26	

Table 98. QUADSPI characteristics in DDR mode<sup>(1)</sup> (continued)

1. Guaranteed by characterization results.

Figure 41. Quad SPI timing diagram - SDR mode

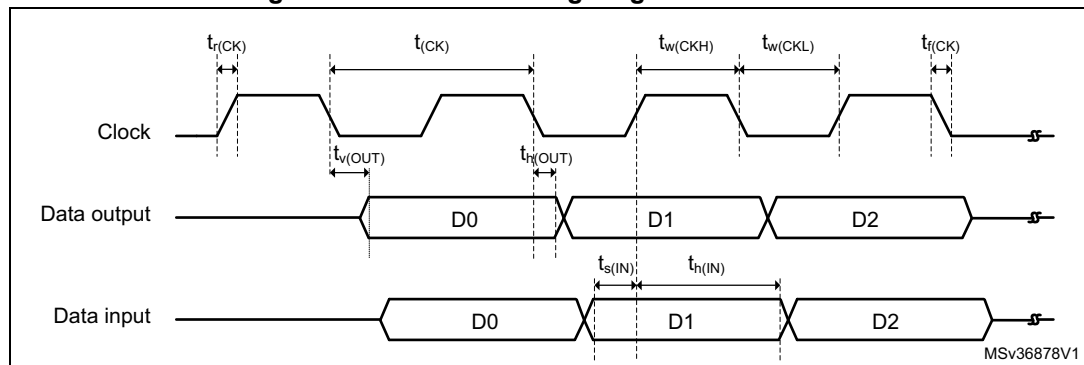

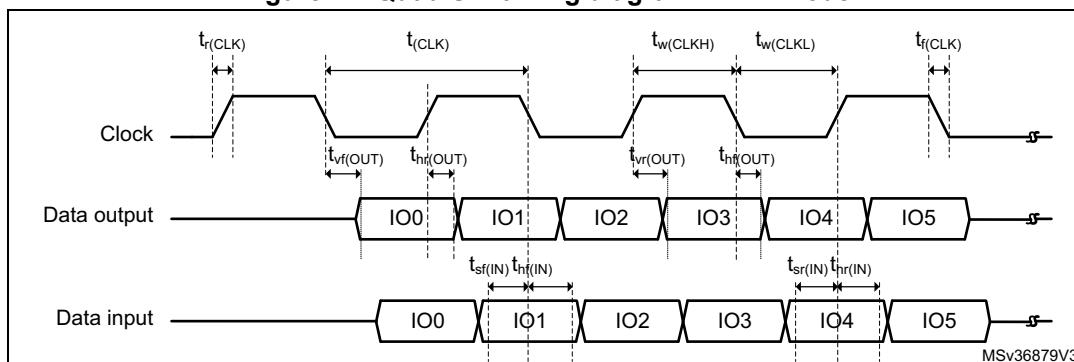

Figure 42. Quad SPI timing diagram - DDR mode

**SAI characteristics**

Unless otherwise specified, the parameters given in [Table 99](#) for SAI are derived from tests performed under the ambient temperature,  $f_{\text{PCLKx}}$  frequency and  $V_{\text{DD}}$  supply voltage conditions summarized in [Table 22: General operating conditions](#), with the following configuration:

- Output speed is set to  $\text{OSPEEDRy}[1:0] = 10$
- Capacitive load  $C = 30 \text{ pF}$
- Measurement points are done at CMOS levels:  $0.5 \times V_{\text{DD}}$

Refer to [Section 6.3.14: I/O port characteristics](#) for more details on the input/output alternate function characteristics (CK,SD,FS).

Table 99. SAI characteristics<sup>(1)</sup>

Symbol	Parameter	Conditions	Min	Max	Unit
$f_{\text{MCLK}}$	SAI Main clock output	-	-	50	MHz

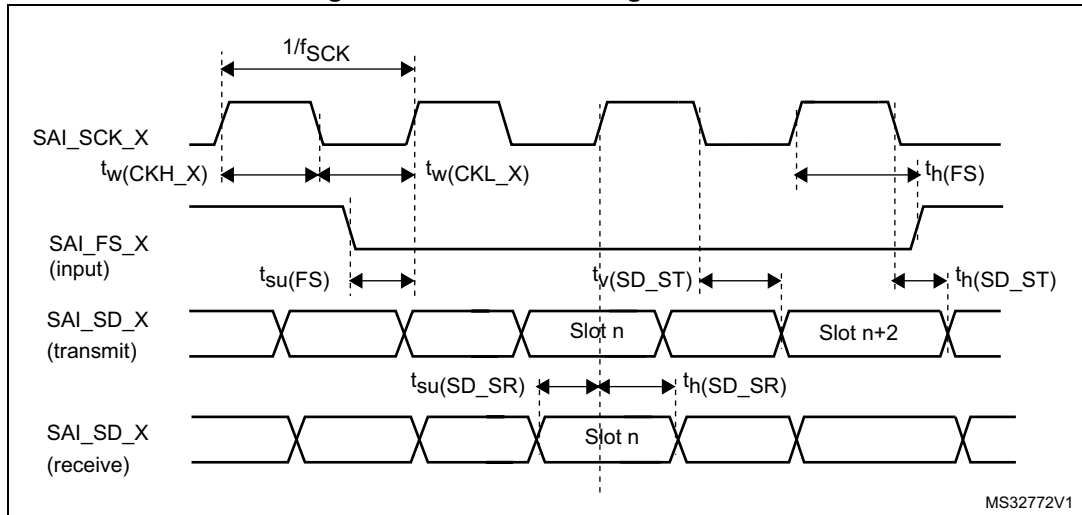

Figure 44. SAI slave timing waveforms

**SDMMC characteristics**

Unless otherwise specified, the parameters given in [Table 100](#) for SDIO are derived from tests performed under the ambient temperature,  $f_{PCLKx}$  frequency and  $V_{DD}$  supply voltage conditions summarized in [Table 22: General operating conditions](#), with the following configuration:

- Output speed is set to  $OSPEEDRy[1:0] = 11$
- Capacitive load  $C = 30$  pF
- Measurement points are done at CMOS levels:  $0.5 \times V_{DD}$

Refer to [Section 6.3.14: I/O port characteristics](#) for more details on the input/output characteristics.

Table 100. SD / MMC dynamic characteristics,  $V_{DD}=2.7\text{ V to }3.6\text{ V}^{(1)}$ 

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$f_{PP}$	Clock frequency in data transfer mode	-	0	-	50	MHz

**USB OTG full speed (FS) characteristics**

The STM32L4A6xG USB interface is fully compliant with the USB specification version 2.0 and is USB-IF certified (for Full-speed device operation).

Table 102. USB OTG DC electrical characteristics

Symbol	Parameter	Conditions	Min <sup>(1)</sup>	Typ	Max <sup>(1)</sup>	Unit
$V_{DDUSB}$	USB OTG full speed transceiver operating voltage	-	3.0 <sup>(2)</sup>	-	3.6	V
$V_{DI}^{(3)}$	Differential input sensitivity	Over $V_{CM}$ range	0.2	-	-	V
$V_{CM}^{(3)}$	Differential input common mode range	Includes $V_{DI}$ range	0.8	-	2.5	
$V_{SE}^{(3)}$	Single ended receiver input threshold	-	0.8	-	2.0	
$V_{OL}$	Static output level low	$R_L$ of 1.5 k $\Omega$ to 3.6 V <sup>(4)</sup>	-	-	0.3	V
$V_{OH}$	Static output level high	$R_L$ of 15 k $\Omega$ to $V_{SS}^{(4)}$	2.8	-	3.6	
$R_{PD}^{(3)}$	Pull down resistor on PA11, PA12 (USB_FS_DP/DM)	$V_{IN} = V_{DD}$	14.25	-	24.8	k $\Omega$

**Table 102. USB OTG DC electrical characteristics (continued)**

Symbol	Parameter	Conditions	Min <sup>(1)</sup>	Typ	Max <sup>(1)</sup>	Unit
R <sub>PU</sub> <sup>(3)</sup>	Pull up resistor on PA12 (USB_FS_DP)	V <sub>IN</sub> = V <sub>SS</sub> , during idle	0.9	1.25	1.575	kΩ
	Pull up resistor on PA12 (USB_FS_DP)	V <sub>IN</sub> = V <sub>SS</sub> during reception	1.425	2.25	3.09	kΩ
	Pull up resistor on PA10 (OTG_FS_ID)	-	-	-	14.5	kΩ

1. All the voltages are measured from the local ground potential.
2. The USB OTG full speed transceiver functionality is ensured down to 2.7 V but not the full USB full speed electrical characteristics which are degraded in the 2.7-to-3.0 V V<sub>DD</sub> voltage range.
3. Guaranteed by design.
4. R<sub>L</sub> is the load connected on the USB OTG full speed drivers.

*Note:* When VBUS sensing feature is enabled, PA9 should be left at its default state (floating input), not as alternate function. A typical 200 μA current consumption of the sensing block (current to voltage conversion to determine the different sessions) can be observed on PA9 when the feature is enabled.

**Figure 47. USB OTG timings – Definition of data signal rise and fall time**

**Table 103. USB OTG electrical characteristics<sup>(1)</sup>**

Driver characteristics					
Symbol	Parameter	Conditions	Min	Max	Unit
t <sub>rLS</sub>	Rise time in LS <sup>(2)</sup>	C <sub>L</sub> = 200 to 600 pF	75	300	ns
t <sub>fLS</sub>	Fall time in LS <sup>(2)</sup>	C <sub>L</sub> = 200 to 600 pF	75	300	ns
t <sub>rfmLS</sub>	Rise/ fall time matching in LS	t <sub>r</sub> /t <sub>f</sub>	80	125	%
t <sub>rFS</sub>	Rise time in FS <sup>(2)</sup>	C <sub>L</sub> = 50 pF	4	20	ns
t <sub>fFS</sub>	Fall time in FS <sup>(2)</sup>	C <sub>L</sub> = 50 pF	4	20	ns
t <sub>rfmFS</sub>	Rise/ fall time matching in FS	t <sub>r</sub> /t <sub>f</sub>	90	111	%
V <sub>CRS</sub>	Output signal crossover voltage (LS/FS)	-	1.3	2.0	V
Z <sub>DRV</sub>	Output driver impedance <sup>(3)</sup>	Driving high or low	28	44	Ω

1. Guaranteed by design.
2. Measured from 10% to 90% of the data signal. For more detailed informations refer to USB Specification - Chapter 7 (version 2.0).

- No external termination series resistors are required on DP (D+) and DM (D-) pins since the matching impedance is included in the embedded driver.

**Table 104. USB BCD DC electrical characteristics<sup>(1)</sup>**

Symbol	Parameter	Conditions	Min.	Typ.	Max.	Unit
I <sub>DD(USBBCD)</sub>	Primary detection mode consumption	-	-	-	300	μA
	Secondary detection mode consumption	-	-	-	300	μA

IDP_SINK	D+ sink current	-	25	-	175	μA
IDM_SINK	D- sink current	-	25	-	175	μA

1. Guaranteed by design.

### CAN (controller area network) interface

Refer to [Section 6.3.14: I/O port characteristics](#) for more details on the input/output alternate function characteristics (CAN\_TX and CAN\_RX).

### 6.3.29 FSMC characteristics

Unless otherwise specified, the parameters given in [Table 105](#) to [Table 118](#) for the FMC interface are derived from tests performed under the ambient temperature,  $f_{HCLK}$  frequency and  $V_{DD}$  supply voltage conditions summarized in [Table 22](#), with the following configuration:

- Output speed is set to OSPEEDRy[1:0] = 11
- Capacitive load C = 30 pF
- Measurement points are done at CMOS levels:  $0.5V_{DD}$

Refer to [Section 6.3.14: I/O port characteristics](#) for more details on the input/output characteristics.

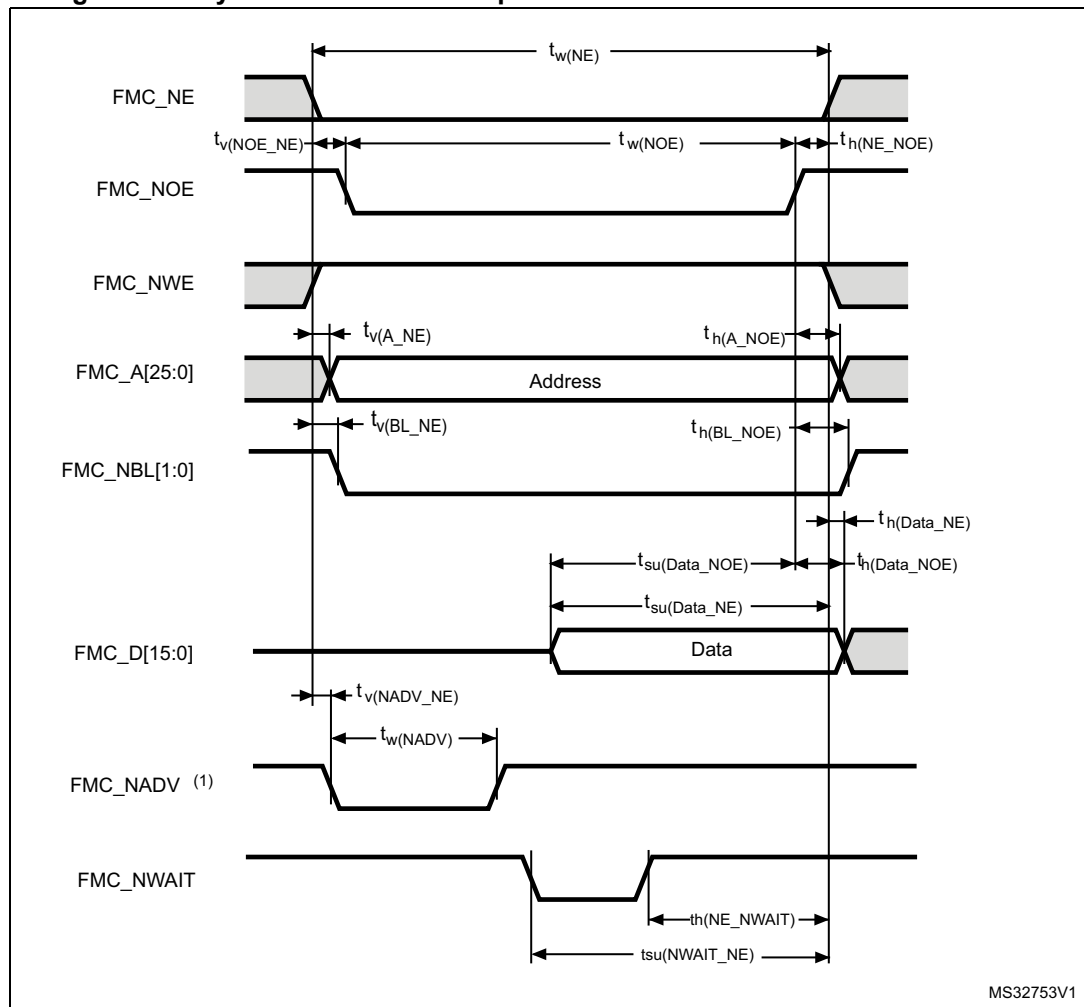

**Asynchronous waveforms and timings**

Figure 48 through Figure 51 represent asynchronous waveforms and Table 105 through Table 112 provide the corresponding timings. The results shown in these tables are obtained with the following FMC configuration:

- AddressSetupTime = 0x1
- AddressHoldTime = 0x1
- DataSetupTime = 0x1 (except for asynchronous NWAIT mode, DataSetupTime = 0x5)
- BusTurnAroundDuration = 0x0

In all timing tables, the THCLK is the HCLK clock period.

**Figure 48. Asynchronous non-multiplexed SRAM/PSRAM/NOR read waveforms**

### Synchronous waveforms and timings

Figure 52 through Figure 55 represent synchronous waveforms and Table 113 through Table 116 provide the corresponding timings. The results shown in these tables are obtained with the following FMC configuration:

- BurstAccessMode = FMC\_BurstAccessMode\_Enable
- MemoryType = FMC\_MemoryType\_CRAM
- WriteBurst = FMC\_WriteBurst\_Enable
- CLKDivision = 1
- DataLatency = 1 for NOR Flash; DataLatency = 0 for PSRAM

In all timing tables, the  $T_{HCLK}$  is the HCLK clock period.

Figure 52. Synchronous multiplexed NOR/PSRAM read timings

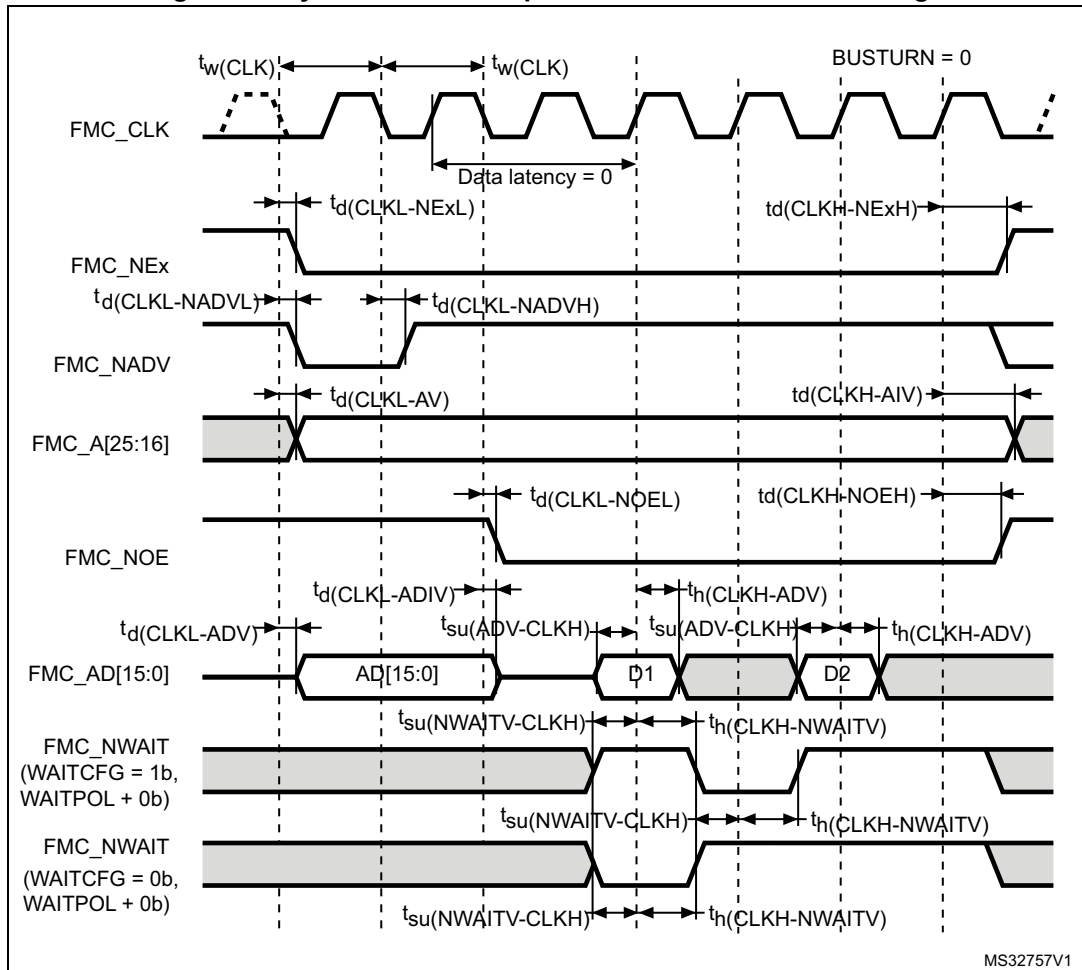

Table 113. Synchronous multiplexed NOR/PSRAM read timings<sup>(1)(2)</sup>

Symbol	Parameter	Min	Max	Unit
$t_{w(\text{CLK})}$	FMC_CLK period	$2T_{\text{HCLK}}-0.5$	-	ns

**NAND controller waveforms and timings**

Figure 56 through Figure 59 represent synchronous waveforms, and Table 117 and Table 118 provide the corresponding timings. The results shown in these tables are obtained with the following FMC configuration:

- COM.FMC\_SetupTime = 0x01
- COM.FMC\_WaitSetupTime = 0x03
- COM.FMC\_HoldSetupTime = 0x02
- COM.FMC\_HiZSetupTime = 0x01
- ATT.FMC\_SetupTime = 0x01
- ATT.FMC\_WaitSetupTime = 0x03
- ATT.FMC\_HoldSetupTime = 0x02
- ATT.FMC\_HiZSetupTime = 0x01
- Bank = FMC\_Bank\_NAND
- MemoryDataWidth = FMC\_MemoryDataWidth\_16b
- ECC = FMC\_ECC\_Enable
- ECCPageSize = FMC\_ECCPageSize\_512Bytes
- TCLRSetupTime = 0
- TARSetupTime = 0

In all timing tables, the  $T_{HCLK}$  is the HCLK clock period.

### 6.3.30 Camera interface (DCMI) timing specifications

Unless otherwise specified, the parameters given in [Table 119](#) for DCMI are derived from tests performed under the ambient temperature,  $f_{HCLK}$  frequency and  $V_{DD}$  supply voltage summarized in [Table 21](#), with the following configuration:

- DCMI\_PIXCLK polarity: falling
- DCMI\_VSYNC and DCMI\_HSYNC polarity: high
- Data format: 14 bits
- Capacitive load  $C=30pF$

Figure 60. DCMI timing diagram

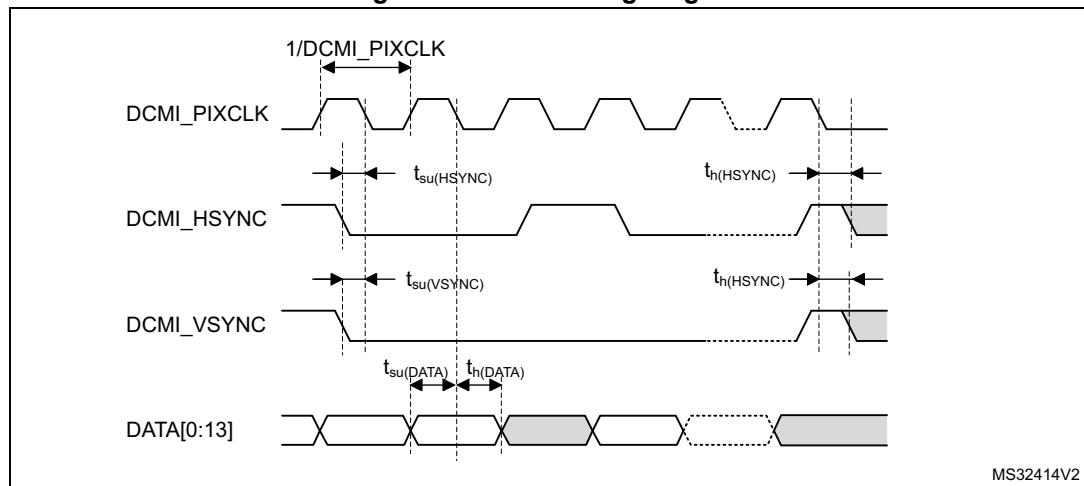

Table 119. DCMI characteristics<sup>(1)</sup>

Symbol	Parameter	Min	Max	Unit
	Frequency ratio DCMI_PIXCLK/ $f_{HCLK}$	-	0.4	
DCMI_PIXCLK	Pixel clock input	-	32	MHz
$D_{pixel}$	Pixel clock input duty cycle	30	70	%
$t_{su}(DATA)$	Data input setup time	4	-	ns
$t_h(DATA)$	Data hold time	5	-	
$t_{su}(HSYNC)$ , $t_{su}(VSYNC)$	DCMI_HSYNC/DCMI_VSYNC input setup time	3	-	
$t_h(HSYNC)$ , $t_h(VSYNC)$	DCMI_HSYNC/DCMI_VSYNC input hold time	3	-	

1. Data based on characterization results, not tested in production.

### 6.3.31 SWPMI characteristics

The Single Wire Protocol Master Interface (SWPMI) and the associated SWPMI\_IO transceiver are compliant with the ETSI TS 102 613 technical specification.

**Table 120. SWPMI electrical characteristics**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$t_{SWPSTART}$	SWPMI regulator startup time	SWP Class B $2.7\text{ V} \leq V_{DD} \leq 3,3\text{V}$	-	-	300	$\mu\text{s}$
$t_{SWPBIT}$	SWP bit duration	$V_{CORE}$ voltage range 1	500	-	-	ns
		$V_{CORE}$ voltage range 2	620	-	-	

### 6.3.32 SD/SDIO MMC card host interface (SDIO) characteristics

Unless otherwise specified, the parameters given in [Table 121](#) for the SDIO/MMC interface are derived from tests performed under the ambient temperature,  $f_{PCLK2}$  frequency and  $V_{DD}$  supply voltage conditions summarized in [Table 22](#), with the following configuration:

- Output speed is set to  $OSPEEDRy[1:0] = 10$
- Capacitive load  $C = 30\text{ pF}$
- Measurement points are done at CMOS levels:  $0.5V_{DD}$

Refer to [Section 6.3.14: I/O port characteristics](#) for more details on the input/output characteristics.

## 7 Package information

In order to meet environmental requirements, ST offers these devices in different grades of ECOPACK packages, depending on their level of environmental compliance. ECOPACK specifications, grade definitions and product status are available at: [www.st.com](http://www.st.com). ECOPACK is an ST trademark.

### 7.1 UFBGA169 package information

This UFBGA is a 169-ball, 7 x 7 mm, 0.50 mm pitch, ultra fine pitch ball grid array package.

Figure 63. UFBGA169 - Outline

1. Drawing is not to scale.

## 7.7 Thermal characteristics

The maximum chip-junction temperature,  $T_J \text{ max}$ , in degrees Celsius, may be calculated using the following equation:

$$T_J \text{ max} = T_A \text{ max} + (P_D \text{ max} \times \Theta_{JA})$$

Where:

- $T_A \text{ max}$  is the maximum ambient temperature in °C,
- $\Theta_{JA}$  is the package junction-to-ambient thermal resistance, in °C/W,
- $P_D \text{ max}$  is the sum of  $P_{INT \text{ max}}$  and  $P_{I/O \text{ max}}$  ( $P_D \text{ max} = P_{INT \text{ max}} + P_{I/O \text{ max}}$ ),
- $P_{INT \text{ max}}$  is the product of all  $I_{DDXX}$  and  $V_{DDXX}$ , expressed in Watts. This is the maximum chip internal power.

$P_{I/O \text{ max}}$  represents the maximum power dissipation on output pins where:

$$P_{I/O \text{ max}} = \sum (V_{OL} \times I_{OL}) + \sum ((V_{DDIOx} - V_{OH}) \times I_{OH}),$$

taking into account the actual  $V_{OL} / I_{OL}$  and  $V_{OH} / I_{OH}$  of the I/Os at low and high level in the application.

**Table 132. Package thermal characteristics**

Symbol	Parameter	Value	Unit
$\Theta_{JA}$	Thermal resistance junction-ambient UFBGA169 - 7 × 7 mm	52	°C/W
	Thermal resistance junction-ambient LQFP144 - 20 × 20 mm	32	
	Thermal resistance junction-ambient UFBGA132 - 7 × 7 mm	55	
	Thermal resistance junction-ambient WLCSP100	35.8	
	Thermal resistance junction-ambient LQFP100 - 14 × 14mm	42	
	Thermal resistance junction-ambient LQFP64	45	

### 7.7.1 Reference document

JESD51-2 Integrated Circuits Thermal Test Method Environment Conditions - Natural Convection (Still Air). Available from [www.jedec.org](http://www.jedec.org)

### 7.7.2 Selecting the product temperature range

When ordering the microcontroller, the temperature range is specified in the ordering information scheme shown in [Section 8: Ordering information](#).

Each temperature range suffix corresponds to a specific guaranteed ambient temperature at maximum dissipation and, to a specific maximum junction temperature.

As applications do not commonly use the STM32L4A6xG at maximum dissipation, it is useful to calculate the exact power consumption and junction temperature to determine which temperature range is best suited to the application.

The following examples show how to calculate the temperature range needed for a given application.

### Example 1: High-performance application

Assuming the following application conditions:

Maximum ambient temperature  $T_{Amax} = 82\text{ °C}$  (measured according to JESD51-2),  
 $I_{DDmax} = 50\text{ mA}$ ,  $V_{DD} = 3.5\text{ V}$ , maximum 20 I/Os used at the same time in output at low level with  $I_{OL} = 8\text{ mA}$ ,  $V_{OL} = 0.4\text{ V}$  and maximum 8 I/Os used at the same time in output at low level with  $I_{OL} = 20\text{ mA}$ ,  $V_{OL} = 1.3\text{ V}$

$$P_{INTmax} = 50\text{ mA} \times 3.5\text{ V} = 175\text{ mW}$$

$$P_{IOmax} = 20 \times 8\text{ mA} \times 0.4\text{ V} + 8 \times 20\text{ mA} \times 1.3\text{ V} = 272\text{ mW}$$

This gives:  $P_{INTmax} = 175\text{ mW}$  and  $P_{IOmax} = 272\text{ mW}$ :

$$P_{Dmax} = 175 + 272 = 447\text{ mW}$$

Using the values obtained in [Table 132](#)  $T_{Jmax}$  is calculated as follows:

– For LQFP100,  $42\text{ °C/W}$

$$T_{Jmax} = 82\text{ °C} + (42\text{ °C/W} \times 447\text{ mW}) = 82\text{ °C} + 18.774\text{ °C} = 100.774\text{ °C}$$

This is within the range of the suffix 6 version parts ( $-40 < T_J < 105\text{ °C}$ ) see [Section 8: Ordering information](#).

In this case, parts must be ordered at least with the temperature range suffix 6 (see Part numbering).

*Note:* With this given  $P_{Dmax}$  user can find the  $T_{Amax}$  allowed for a given device temperature range (order code suffix 6 or 3).

$$\text{Suffix 6: } T_{Amax} = T_{Jmax} - (42\text{ °C/W} \times 447\text{ mW}) = 105 - 18.774 = 86.226\text{ °C}$$

$$\text{Suffix 3: } T_{Amax} = T_{Jmax} - (42\text{ °C/W} \times 447\text{ mW}) = 130 - 18.774 = 111.226\text{ °C}$$

### Example 2: High-temperature application

Using the same rules, it is possible to address applications that run at high ambient temperatures with a low dissipation, as long as junction temperature  $T_J$  remains within the specified range.

Assuming the following application conditions:

Maximum ambient temperature  $T_{Amax} = 100\text{ °C}$  (measured according to JESD51-2),  
 $I_{DDmax} = 20\text{ mA}$ ,  $V_{DD} = 3.5\text{ V}$ , maximum 20 I/Os used at the same time in output at low level with  $I_{OL} = 8\text{ mA}$ ,  $V_{OL} = 0.4\text{ V}$

$$P_{INTmax} = 20\text{ mA} \times 3.5\text{ V} = 70\text{ mW}$$

$$P_{IOmax} = 20 \times 8\text{ mA} \times 0.4\text{ V} = 64\text{ mW}$$

This gives:  $P_{INTmax} = 70\text{ mW}$  and  $P_{IOmax} = 64\text{ mW}$ :

$$P_{Dmax} = 70 + 64 = 134\text{ mW}$$

Thus:  $P_{Dmax} = 134\text{ mW}$

Using the values obtained in [Table 132](#)  $T_{Jmax}$  is calculated as follows:

– For LQFP100,  $42\text{ °C/W}$

$$T_{Jmax} = 100\text{ °C} + (42\text{ °C/W} \times 134\text{ mW}) = 100\text{ °C} + 5.628\text{ °C} = 105.628\text{ °C}$$

This is above the range of the suffix 6 version parts ( $-40 < T_J < 105\text{ °C}$ ).

In this case, parts must be ordered at least with the temperature range suffix 3 (see [Section 8: Ordering information](#)) unless we reduce the power dissipation in order to be able to use suffix 6 parts.

## 8 Ordering information

**Table 133. STM32L4A6xG ordering information scheme**

Example:	STM32	L	4A6	V	G	T	6	-	TR
<b>Device family</b>									
STM32 = Arm <sup>®</sup> based 32-bit microcontroller									
<b>Product type</b>									
L = ultra-low-power									
<b>Device subfamily</b>									
4A6: STM32L4A6xG									
<b>Pin count</b>									
R = 64 pins									
V = 100 pins									
Q = 132 pins									
Z = 144 pins									
A = 169 pins									
<b>Flash memory size</b>									
G = 1 MB of Flash memory									
<b>Package</b>									
T = LQFP ECOPACK2									
I = UFBGA ECOPACK2									
Y = CSP ECOPACK2									
<b>Temperature range</b>									
6 = Industrial temperature range, -40 to 85 °C (105 °C junction)									
3 = Industrial temperature range, -40 to 125 °C (130 °C junction)									
<b>Option</b>									
Blank = Standard production with integrated LDO									
P = Dedicated pinout supporting external SMPS									
<b>Packing</b>									
TR = tape and reel									
xxx = programmed parts
