## Features

- Main switches max. $\mathrm{R}_{\mathrm{ON}}$ less than $2 \Omega$
- Provides 7 auxiliary switches with $\mathrm{R}_{\mathrm{ON}}<75 \Omega$
- $6 \mathrm{~V}_{\mathrm{PP}}$ amplitude of analog input signal
- Digital inputs are TTL levels compatible

## Applications

■ Telecom infrastructure

- Relays replacement
- E1/T1 signals routing
- Loopback hardware diagnostic
- Line card
- Negative rail signal routing

## Description

The STM7E1A consists of 7 identical ISDN E1 channels, each channel corresponding to 4 main low-resistant switches (a and b) and 2 auxiliary switches (c and d). The switches positions in all the channels are identical and controlled by a unique control resource driven by the digital inputs Lm, Ls and Sc.
In each channel, the TX and RX lines can be switched between a main port or a spare port by the main switches: if both "a" switches are closed and both "b" switches are open, the main port is connected to the line, while if both "a" switches are open and both "b' switches are closed, the spare port is connected to the line.

The 2 auxiliary switches enable to close a local loop between the TX and RX access of a port: if "c" is closed, the spare port RX and TX access is connected between each other to form a local

loop, while if "d" is closed, the main port RX and TX access is connected between each other to form a local loop.

The spare port is only used for test purpose on the system board while the main port is the communication channel. Consequently, a switching from the main port to the spare port occurs very rarely (< 10 times a day).
The power supplies of the chip need to be de coupled properly. This means that at least one external capacitor C 1 must be connected in between GND and VPOS, one external capacitor C2 between GND and VNEG, and one external capacitor C3 between each pair of VNEG and VPOS.

Table 2. Decoding of functional mode 1 (mode $=L$ )

| Switches | Status |  | Description |
| :--- | :---: | :---: | :--- |
| Main | Sc low | a closed, b open | Main port is connected to the line |
|  | Sc high | a open, b closed | Spare port is connected to the line |
|  | Lm low | d open | Main port local loop open |
|  | Lm high | d closed | Main port local loop closed |
|  | Ls low | c open | Spare port local loop open |
|  | Ls high | c closed | Spare port local loop closed |

When closing the main port local loop (Lm high), it is external system responsibility to ensure that the main port has previously been disconnected from the line (Sc has to be high). There is no internal mechanism to ensure this.

When closing the spare port local loop (Ls high), it is external system responsibility to ensure that the spare port has previously been disconnected from the line (Sc has to be high). There is no internal mechanism to ensure this.

### 1.1 Test mode description (mode $=0$, test $=1$ )

In order to test the main switches (4-point measurement), test modes are foreseen where the main switches can be controlled independently from each other. One can enter in test mode by controlling the Sc , Lm and Ls pins according to the following table.

The digital part and auxiliary switches can be tested in functional mode

Table 5. Test mode

| Signification | Sc | Lm | Ls |
| :---: | :---: | :---: | :---: |
| A_TX closed | H | H | L |
| A_RX closed | L | H | L |
| B_TX closed | H | L | H |

| B_TX \& c closed | H | L | L |
| A_RX \& d closed | L | L | L |
| All main switches open | H | H | H |
|  | L | H | H |

Note: Although there is an internal pull down in the TEST pin, an external hardware connection from TEST to GND is required on the board to work in functional, mode.

| t | Switch time of the main switches (a and b) |  |  | 0.15 | 1 | $\mu \mathrm{s}$ |

1. All the parameters are valid only with a $75 \Omega(5 \%)$ load to GND.
2. Not tested in production.
3. Measured with a 5 V DC voltage applied to a closed switch.
4. Measured with a $2 \mathrm{~V}_{\mathrm{PP}}$ signal.
5. Measured with the line connected to GND at one side with a $75 \Omega$ resistor and all the other lines driven by a $1 \mathrm{MHz}, 2 \mathrm{~V} \mathrm{PP}$ sine wave signal.

Note: $\quad$ During the switching between the main and spare ports, the behavior of the component is not guaranteed: both main switches can be open (break before make).

Note: 1 Measured with the line switching from a 2.5 V DC level (main or spare port) to a -2.5 V DC level (spare or main port).
