

STMEC001

Power interface switch for ExpressCardTM

Features

- Compliant with PC Card[™] standard for ExpressCard
- 3-channel power interface switch
- Built-in under-voltage lockout (UVLO) circuit
- Ultra-low standby-mode current
- Additional 5 V or 12 V power supply not required
- High reliability ensured with integrated overcurrent, thermal and undervoltage protection circuitries applied to each voltage rail
- Soft start function for non-rush current
- Ultra-low standby-mode current for power saving
- Ultra-low ON resistance for fast switching

Description

The STMEC001 is an ExpressCard power interface switch which provides the complete power management solution required by the ExpressCard specification.

The STMEC001 consists of 3 internal switches distributing 3.3 V, 3.3 V_{AUX} , and 1.5 V to the ExpressCard socket without the need of additional charge pump or external switches.

The STMEC001 ExpressCard power switch is ideal for notebook computers, desktop computers, personal digital assistants (PDA), or other handheld devices implementing the ExpressCard schematic.

Pin description STMEC001

Table 2. Pin assignments

	Pin			_	
	QFN16	TSSOP20	Name	Type	Description
	15	1	/SYSRST	I	System Reset input - active low, logic level signal, internal 150 K Ω pull-up
	16	2	/SHDN	I	Shutdown input - active low, logic level signal, internal 150 KΩ pull-down
	1	3	/STBY	ı	Standby input - active low, logic level signal, internal 150 $\mathrm{K}\Omega$ pull-down
	2	4	VIN_3.3V	I	3.3 V input for VO_3.3V
	-	5	VIN_3.3V	I	3.3 V input for VO_3.3V
	3	6	VO_3.3V	0	Switched output that delivers 0 V, 3 3 V or high impedance to card
	4	7	VO_3.3V	0	Switched output that deliners o V, 3.3 V or high impedance to card
	5	8	/PERST	0	A logic level power good to slot (delayed)
	-	9	NC	-	No connection
	6	10	GND	-	Grc un 1
	7	11	/CPUSB		Card present input for USB cards, internal 150 K Ω pull-up
	8	12	/CPPE	-	Card present input for PCI ExpressCard, internal 150 KΩ pull-up
	9	13	VO_1.5V	0	Switched output that delivers 0 V, 1.5 V or high impedance to card
		(CfD)	VO_1.5V	0	Switched output that delivers 0 V, 1.5 V or high impedance to card
	10	15	VIN_1.5V	I	1.5 V input for 1.5Vout
	10	16	VIN_1.5V	I	1.5 V input for 1.5V _{OUT}
50/6	11	17	VO_3.3V _{AUX}	0	Switched output that delivers 0 V, 3.3 V or high impedance to card
0_2	12	18	VIN_3.3V _{AUX}	I	3.3 V input for VO_3.3V _{AUX} and chip power
,	13	19	RCLKEN	I/O	Reference clock enable signal. As an output, a logic level power good to host for slot (open drain). As an input, if kept inactive by the host, prevents /PERST from being de-asserted, internal 150 K Ω pull-up
	14	20	/OC	0	Over-current status output for slot (open drain)

STMEC001 Pin description

1.1 Pin functional description

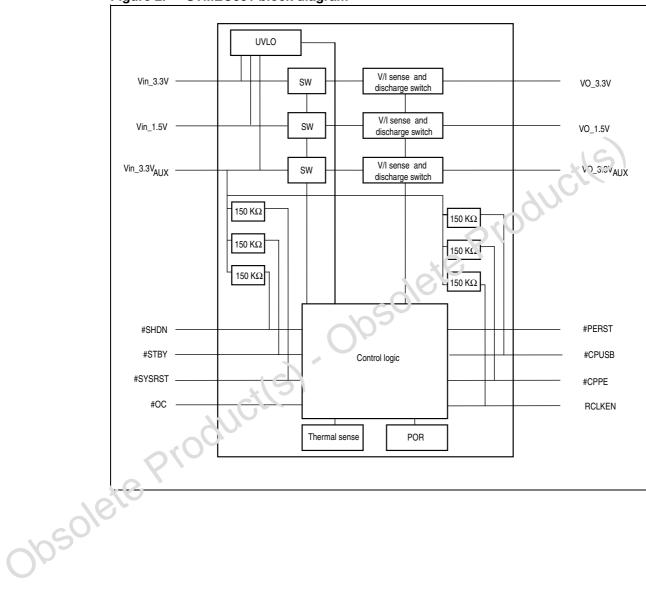

Table 3. Pin detailed descriptions

Symbol	Description
CPPE	A logic low level on this input indicates that the card present supports PCI Express functions. This input pin connects to the 3.3 V_{AUX} input through a 150 $k\Omega$ internal pull up. When inserted, the card physically connects this input to ground if the card supports PCI Express functions.
CPUSB	A logic low level on this input indicates that the card present supports USB functions. The input pin CPUSB connects to the 3.3 V_{AUX} input through a 150 $k\Omega$ internal pull up. When inserted, the card physically connects CPUSB to ground if the card supports USE functions.
SHDN	When asserted (logic low), this input instructs the STMEC001 to turn off all voltage outputs and the discharge FETs at the 3 outputs are activated.
STBY	When asserted (logic low), this input places the power switch in Stanc by Mode by turning off the 3.3 V and 1.5 V power switches and keeping the 2.3 VAUX switch on.
RCLKEN	This pin serves as both an input and an output. On power up, the power switch keeps this signal at a low state as long as any of the output power rails are out of their tolerance range. Once all output power rails are within the rance, the power switch releases RCLKEN allowing it to transition to a high state (internally pulled up to 3.3 V _{AUX}). The transition of RCLKEN from a low to a high state starts an internal timer for the purpose of de-asserting /PERST. As an input, RCLKEN can be kept low to delay the start of the /PERST internal timer. RCLKEN can be used by the host system to enable a clock driver.
PERST	On power up, this outout remains asserted. Once all power rails are within tolerance, RCLKEN is asserted and /PERST is de-asserted after a time delay. On power down, this output is asserted whenever any of the power rails drop below their voltage tolerance.
SYSRST	This input is dr.ven by the host system and directly affects /PERST. Asserting /SYSRST (logic icvol iow) forces /PERST to assert.
OC	The DC pin is an open drain output for over-current indication. Output does not turn off during over-current condition. The output voltage decreases as the output current exceeds over-current limit. Only if the temperature increases above the limit the output is turned off completely. Over-current in one output does not affect the other outputs.

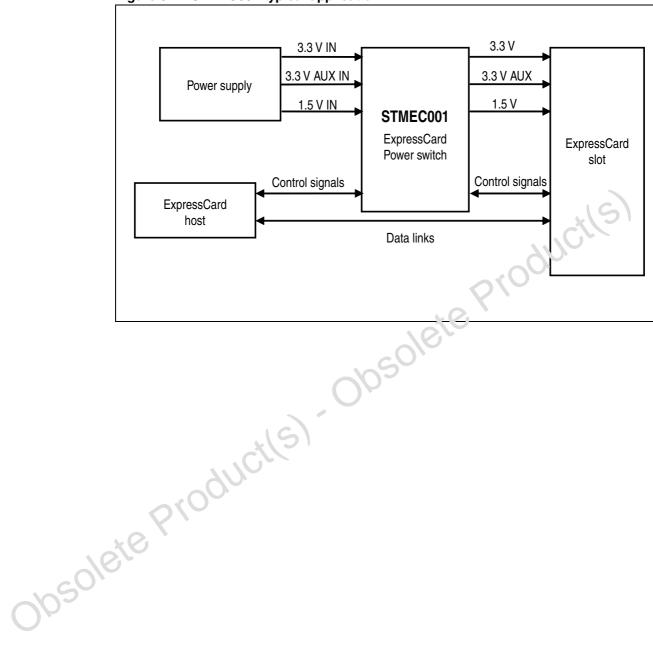

Figure 3. STMEC001 typical application

Maximum ratings STMEC001

3 Maximum ratings

8/19

Stressing the device above the rating listed in the "Absolute maximum ratings" table may cause permanent damage to the device. These are stress ratings only and operation of the device at these or any other conditions above those indicated in the operating sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Table 4. Absolute maximum ratings⁽¹⁾

Symbol	Parameter	Value	Unit
		V _I (3.3V _{IN}) – 0.3 to 4.6	V
V_{I}	Input voltage	V _I (1.5V _{IN}) – 0.3 to 4.6	
		V _I (3.3V _{AUX}) – 0.3 to 4.6	V
		V _I (3.3V _{IN}) internally limited	
Io	Output current	V _I (1.5V _{IN}) nternally limited	
		$V_{I}(3.3V_{A', \gamma})$ internally limited	
T _{OP}	Operating junction temperature, T _J (max to be calc. at worst case PD at 85° C ambient)	-40 to 120	°C
T _{STG}	Storage temperature range	-55 to 150	°C

^{1.} Absolute maximum ratings are those values above which damage to the device may occur. Functional operation under these conditions is not implied. All voltages are referenced to GND.

STMEC001 Power states

4 Power states

The STMEC001 operates in a number of states, as described in the following table:

Table 5. Power states

Vo	Voltage inputs			Logic states			Outputs		Mode	
3.3V _{AUX}	3.3 V	1.5 V	/SHDN	/CPUSB	/CPPE	/STBY	3.3V _{AUX}	3.3 V	1.5 V	
ON	Х	Х	1	1	1	Х	GND	GND	GND	No card
ON	Х	Х	0	Х	Х	Х	GND	GND	GND	Shutdown
ON	ON	ON	1	0	Х	1	ON	ON	ON	USB enable
ON	ON	ON	1	Х	0	1	ON	ON	ON	רו E enable
ON	ON	ON	1	Х	Х	0	ON	OFF	OF.F	Standby
OFF	Х	Х	Х	Х	Х	Х	OFF	OF ^r -	OFF	OFF

4.1 Power states description

- No card mode: when no card is inserted, εnc' at least 3.3 V_{AUX} is available, all outputs are grounded
- Shutdown mode: when /SHDN is anscrited, and at least 3.3 V_{AUX} is available all outputs are grounded
- **USB/PW enable mode**: when all 3 inputs are available, detection of cartd insertion turns on all 3 outputs
 - VIN_3.3 V. \ IN_3.3 V_{AUX} and VIN_1.5 V are present at the USB/PW enable input of the pover switch prior to a card being inserted. Power to the card is based on the ctate of /CPUSB and /CPPE (see table).
 - 1 he card is present and VIN_1.5 V or/and VIN_3.3 V is removed from the input of the power switch; VIN_3.3V_{AUX} will still be provided to the card, VIN_1.5 and VIN_3.3 V will be disabled (see table). If power to VIN_1.5 V and VIN_3.3 V is restored, output to the card will be restored.
 - Prior to the insertion of a card, VIN_3.3 V_{AUX} is available, VIN_3.3 V and VIN_1.5 V are not available; no power is made available to the card. If VIN_1.5 V and VIN_3.3 V are made available at the input of the power switch after the card is inserted, both VO_3.3 V and VO_1.5 V are made available to the card.
 - Standby mode: when all 3 supplies are available and /STBY is asserted. Only 3.3 V_{AUX} output is on.
 - OFF mode: if V_{AUX} is off, all outputs are off. When VIN_3.3V_{AUX} is not present, VIN_1.5 V or/and VIN_3.3 V must not be present.

Electrical characteristics STMEC001

8 Package mechanical data

In order to meet environmental requirements, ST offers these devices in ECOPACK[®] packages. These packages have a Lead-free second level interconnect. The category of second Level Interconnect is marked on the package and on the inner box label, in compliance with JEDEC Standard JESD97. The maximum ratings related to soldering conditions are also marked on the inner box label. ECOPACK is an ST trademark. ECOPACK specifications are available at: www.st.com.
