# Dual DC-DC converter for powering AMOLED displays 

## Datasheet - production data

DFN12L (3 x 3 mm )

## Features

- Step-up and inverter converters
- Operating input voltage range from 2.3 V to 4.5 V
- Synchronous rectification for both DC-DC converters
- 200 mA output current
- 4.6 V fixed positive output voltages
- Programmable negative voltage by SWIRE from - 2.4 V to - 5.4 V
- Typical efficiency: 85\%
- Pulse skipping mode in light load condition
- 1.5 MHz PWM mode control switching frequency
- Enable pin for shutdown mode
- Low quiescent current: $<1 \mu \mathrm{~A}$ in shutdown mode
- Soft-start with inrush current protection
- Overtemperature protection
- Temperature range: - $40^{\circ} \mathrm{C}$ to $85^{\circ} \mathrm{C}$
- True-shutdown mode

Table 1. Device summary

| Order code | Positive voltage | Negative voltage | Package | Packaging |
| :---: | :---: | :---: | :---: | :---: |
| STOD03ATPUR | 4.6 V | -2.4 V to -5.4 V | DFN12L $(3 \times 3 \mathrm{~mm})$ | 3000 parts per reel |

## 1 Schematic

Figure 1. Application schematic

Table 2. Typical external components

| Component | Manufacturer | Part number | Value | Size |
| :---: | :---: | :---: | :---: | :---: |
| $\mathrm{L}_{1}$ | ABCO | LPF2807T-4R7M | $4.7 \mu \mathrm{H}$ | $2.8 \times 2.8 \times 0.7 \mathrm{~mm}$ |
| $\mathrm{~L}_{2}{ }^{(1)}$ | ABCO | LPF3509T-4R7M | $4.7 \mu \mathrm{H}$ | $3.5 \times 3.5 \times 1.0 \mathrm{~mm}$ |
|  | TDK | VLF4014AT-4R7M1R1 | $4.7 \mu \mathrm{H}$ | $3.7 \times 3.5 \times 1.4 \mathrm{~mm}$ |
| $\mathrm{C}_{\mathrm{IN}}$ | Murata | GRM21BR61E475KA12 | $4.7 \mu \mathrm{~F}$ | 0805 |
| $\mathrm{C}_{\text {MID }}$ | Murata | GRM21BR61E475KA12 | $4.7 \mu \mathrm{~F}$ | 0805 |
| $\mathrm{C}_{\mathrm{O} 2}$ | Murata | GRM21BR61E475KA12 | $4.7 \mu \mathrm{~F}$ | 0805 |
| $\mathrm{C}_{\text {REF }}$ | Murata | GRM155R60J105KE19 | $1 \mu \mathrm{~F}$ | 0402 |

1. From -5.0 V to $-5.4 \mathrm{~V}, 200 \mathrm{~mA}$ load can be provided with inductor saturation current as a minimum of 1 A .

Note: $\quad$ All the above components refer to the typical application performance characteristics. Operation of the device is not limited to the choice of these external components. Inductor values ranging from $2.2 \mu \mathrm{H}$ to $6.8 \mu \mathrm{H}$ can be used together with the STOD03A. See Section 7.1.1 for peak inductor current calculation.

Figure 2. Block schematic

## 2 Pin configuration

Figure 3. Pin configuration (top view)

Table 3. Pin description

| Pin name | Pin number | Description |
| :---: | :---: | :--- |
| Lx $_{1}$ | 1 | Switching node of the step-up converter |
| PGND | 2 | Power ground pin |
| $\mathrm{V}_{\text {MID }}$ | 3 | Step-up converter output voltage (4.6V) |
| NC | 4 | Not internally connected |
| AGND | 5 | Signal ground pin. This pin must be connected to the power ground pin |
| $\mathrm{V}_{\text {REF }}$ | 6 | Voltage reference output. 1 $\mu$ F bypass capacitor must be connected between <br> this pin and AGND |
| S WIRE $^{\text {EN }}$ | 8 | Negative voltage setting pin. Uses SWIRE protocol, see details in <br> Section 6.1.2 |
| $\mathrm{V}_{\text {O2 }}$ | 9 | Enable control pin. ON=V INA. When pulled low it puts the device in <br> shutdown mode |
| Lx $_{2}$ | 10 | Inverting converter output voltage (Default -4.9V). |
| $\mathrm{V}_{\text {IN A }}$ | 11 | Switching node of the inverting converter |
| $\mathrm{V}_{\text {iN P }}$ | 12 | Analogic input supply voltage |
|  | Power input supply voltage |  |

## 3 Maximum ratings

Table 4. Absolute maximum ratings

| Symbol | Parameter | Value | Unit |
| :---: | :--- | :---: | :---: |
| $\mathrm{V}_{\text {INA }}, \mathrm{V}_{\text {INP }}$ | DC supply voltage | -0.3 to 6 | V |
| $\mathrm{EN}, \mathrm{S}_{\mathrm{WIRE}}$ | Logic input pins | -0.3 to 4.6 | V |
| $\mathrm{IL}_{\mathrm{X} 2}$ | Inverting converter switching current | Internally limited | A |
| $\mathrm{L}_{\mathrm{X} 2}$ | Inverting converter switching node voltage | -10 to $\mathrm{V}_{\text {INP }}+0.3$ | V |
| $\mathrm{~V}_{\mathrm{O} 2}$ | Inverting converter output voltage | -10 to $\mathrm{AGND}+0.3$ | V |
| $\mathrm{~V}_{\text {MID }}$ | Step-up converter and output voltage | -0.3 to 6 | V |
| $\mathrm{~L}_{\mathrm{X} 1}$ | Step-up converter switching node voltage | -0.3 to $\mathrm{V}_{\text {MID }}+0.3$ | V |
| $\mathrm{IL}_{\mathrm{X} 1}$ | Step-up converter switching current | Internally limited | A |
| $\mathrm{V}_{\text {REF }}$ | Reference voltage | -0.3 to 3 | V |
| $\mathrm{P}_{\mathrm{D}}$ | Power dissipation | Internally limited | mW |
| $\mathrm{T}_{\mathrm{STG}}$ | Storage temperature range | -65 to 150 | ${ }^{\circ} \mathrm{C}$ |
| $\mathrm{T}_{\mathrm{J}}$ | Maximum junction temperature | 150 | ${ }^{\circ} \mathrm{C}$ |
| ESD | ESD protection HBM | 2 | kV |

Note: $\quad$ Absolute maximum ratings are those values beyond which damage to the device may occur. Functional operation under these conditions is not implied.

Table 5. Thermal data

| Symbol | Parameter | Value | Unit |
| :---: | :--- | :---: | :---: |
| $R_{\text {thJA }}$ | Thermal resistance junction-ambient referred to the FR-4 PCB | 48.8 | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |
| $\mathrm{R}_{\text {thJC }}$ | Thermal resistance junction-case | 2.6 | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |

## 4 Electrical characteristics

$\mathrm{T}_{J}=25^{\circ} \mathrm{C}, \mathrm{V}_{\text {INA }}=\mathrm{V}_{\text {INP }}=3.7 \mathrm{~V}, \mathrm{I}_{\mathrm{MID}, \mathrm{O} 2}=30 \mathrm{~mA}, \mathrm{C}_{\text {IN }}=4.7 \mu \mathrm{~F}, \mathrm{C}_{\mathrm{MID}, \mathrm{O} 2}=4.7 \mu \mathrm{~F}, \mathrm{C}_{\text {REF }}=1$ $\mu \mathrm{F}, \mathrm{L} 1=4.7 \mu \mathrm{H}, \mathrm{L} 2=4.7 \mu \mathrm{H}, \mathrm{V}_{\mathrm{EN}}=\mathrm{V}_{\mathrm{INA}}=\mathrm{V}_{\text {INP }}, \mathrm{V}_{\mathrm{MID}}=4.6 \mathrm{~V}, \mathrm{~V}_{\mathrm{O} 2}=-4.9 \mathrm{~V}$ unless otherwise specified.

Table 6. Electrical characteristics

| Symbol | Parameter | Test conditions | Min. | Typ. | Max. | Unit |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| General Section |  |  |  |  |  |  |
| $\mathrm{V}_{\text {INA }} \mathrm{V}_{\text {INP }}$ | Supply input voltage |  | 2.3 |  | 4.5 | V |
| UVLO_H | Undervoltage lockout HIGH | $\mathrm{V}_{\text {INA }}$ rising |  | 2.22 | 2.25 | V |
| UVLO_L | Undervoltage lockout LOW | $\mathrm{V}_{\text {INA }}$ falling | 1.9 | 2.18 |  | V |
| I_V | Input current | No load condition (sum of $\mathrm{V}_{\text {INA }}$ and $\mathrm{V}_{\text {INP }}$ ) |  | 1.3 | 1.7 | mA |
| $\mathrm{I}_{\text {Q_SH }}$ | Shutdown current | $\mathrm{V}_{\mathrm{EN}}=\mathrm{GND}$ (sum of $\mathrm{V}_{\text {INA }}$ and <br> $\mathrm{V}_{\text {INP }}$ ); $\mathrm{T}_{\mathrm{J}}=-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$; |  |  | 1 | $\mu \mathrm{A}$ |
| $\mathrm{V}_{\text {EN }} \mathrm{H}$ | Enable high threshold | $\mathrm{V}_{\text {INA }}=2.3 \mathrm{~V}$ to 4.5 V , <br> $\mathrm{T}_{\mathrm{J}}=-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$; | 1.2 |  |  | V |
| $\mathrm{V}_{\text {EN }} \mathrm{L}$ | Enable low threshold |  |  |  | 0.4 |  |
| $\mathrm{I}_{\mathrm{EN}}$ | Enable input current | $\begin{aligned} & V_{E N}=V_{I N A}=4.5 \mathrm{~V} ; \\ & T_{J}=-40^{\circ} \mathrm{C} \text { to }+85^{\circ} \mathrm{C} ; \end{aligned}$ |  |  | 1 | $\mu \mathrm{A}$ |

## 6 Detailed description

## 6.1 $\mathrm{S}_{\text {WIRE }}$

- Protocol: to digitally communicate over a single cable with single-wire components
- Single-wire's 3 components:

1. An external MCU
2. Wiring and associated connectors
3. STOD13AS device with a dedicated single-wire pin.

### 6.1.1 $\quad S_{\text {WIRE }}$ features and benefits

- Fully digital signal
- No handshake needed
- Protection against glitches and spikes though an internal low pass filter acting on falling edges
- Uses a single wire (plus analog ground) to accomplish both communication and power control transmission
- Simplify design with an interface protocol that supplies control and signaling over a single-wire connection to set the output voltages.

### 6.1.2 $\quad S_{\text {WIRE }}$ protocol

- Single-wire protocol uses conventional CMOS/TTL logic levels (maximum 0.6 V for logic "zero" and a minimum 1.2 V for logic "one") with operation specified over a supply voltage range of 2.5 V to 4.5 V
- Both master (MCU) and slave (STOD13AS) are configured to permit bit sequential data to flow only in one direction at a time; master initiates and controls the device
- Data is bit-sequential with a START bit and a STOP bit
- Signal is transferred in real time
- System clock is not required; each single-wire pulse is self-clocked by the oscillator integrated in the master and is asserted valid within a frequency range of 250 kHz (maximum).

### 6.1.3 $\quad S_{\text {WIRE }}$ basic operations

- The negative output voltage levels are selectable within a wide range (steps of 100 mV )
- The device can be enabled / disabled via SWIRE in combination with the Enable pin.

### 6.2 Negative output voltage levels

Table 7. Negative output voltage levels

| Pulse | $\mathbf{V}_{\mathbf{O 2}}$ | Pulse | $\mathbf{V}_{\mathbf{O 2}}$ | Pulse | $\mathbf{V}_{\mathbf{O 2}}$ |
| :---: | :---: | :---: | :---: | :---: | :---: |

| High | Default negative output voltage |  |

1. The Enable pin must be set to AGND while using the S SIRE function.

## 7 Application information

### 7.1 External passive components

### 7.1.1 Inductor selection

The inductor is the key passive component for switching converters.
For the step-up converter an inductance between $4.7 \mu \mathrm{H}$ and $6.8 \mu \mathrm{H}$ is recommended.
For the inverting stage the suggested inductance ranges from $2.2 \mu \mathrm{H}$ to $4.7 \mu \mathrm{H}$.
It is very important to select the right inductor according to the maximum current the inductor can handle to avoid saturation. The step-up and the inverting peak current can be calculated as follows:

## Equation 1

$$
\mathrm{I}_{\text {PEAK-BOOST }}=\frac{\mathrm{V}_{\text {MID }} \times \mathrm{I}_{\text {OUT }}}{\eta 1 \times \mathrm{VIN}_{\text {MIN }}}+\frac{\mathrm{VIN}_{\text {MIN }} \times\left(\mathrm{V}_{\text {MID }}-\mathrm{VIN}_{\text {MIN }}\right)}{2 \times \mathrm{V}_{\text {MID }} \times \mathrm{fs} \times \mathrm{L} 1}
$$

## Equation 2

$$
I_{\text {PEAK- INVEETNG }}=\frac{\left(V I N_{M I N}-V O 2_{\text {MIN }}\right) \times I_{\text {OUT }}}{\eta 2 \times V I N_{M I N}}+\frac{V I N_{M I N} \times V O 2_{\text {MIN }}}{2 \times\left(V O 2_{\text {MIN }}-V I N_{M I N}\right) \times f S \times L 2}
$$

where
$\mathrm{V}_{\text {MID }}$ : step-up output voltage, fixed at 4.6 V ;
$\mathrm{V}_{\mathrm{O} 2}$ : inverting output voltage including sign (minimum value is the absolute maximum value);
$\mathrm{I}_{\mathrm{O}}$ : output current for both DC-DC converters;
$\mathrm{V}_{\mathbb{N}}$ : input voltage for the STOD03A;
$\mathrm{f}_{\mathrm{s}}$ : switching frequency. Use the minimum value of 1.2 MHz for the worst case;
$\eta 1$ : efficiency of step-up converter. Typical value is 0.85 ;
$\eta 2$ : efficiency of inverting converter. Typical value is 0.75 .
The negative output voltage can be set via $\mathrm{S}_{\text {WIRE }}$ at - 5.4 V . Accordingly, the inductor peak current, at the maximum load condition, increases. A proper inductor, with a saturation current as a minimum of 1 A , is preferred.

### 7.1.2 Input and output capacitor selection

It is recommended to use ceramic capacitors with low ESR as input and output capacitors in order to filter any disturbance present in the input line and to obtain stable operation for the two switching converters. A minimum real capacitance value of $2 \mu \mathrm{~F}$ must be guaranteed for $\mathrm{C}_{\mathrm{MID}}$ and $\mathrm{C}_{\mathrm{O} 2}$ in all conditions. Considering tolerance, temperature variation, and DC polarization, a $4.7 \mu \mathrm{~F} 10 \mathrm{~V}$ capacitor can be used to achieve the required $2 \mu \mathrm{~F}$.

### 7.2 Recommended PCB layout

The STOD03A is a high frequency power switching device and therefore requires a proper PCB layout in order to obtain the necessary stability and optimize line/load regulation and output voltage ripple.

Analog input ( $\mathrm{V}_{\text {INA }}$ ) and power input ( $\mathrm{V}_{\text {INP }}$ ) must be kept separated and connected together at the $\mathrm{C}_{\mathbb{I N}}$ pad only. The input capacitor must be as close as possible to the IC.
In order to minimize ground noise, a common ground node for power ground and a different one for analog ground must be used. In the recommended layout, the AGND node is placed close to $\mathrm{C}_{\text {REF }}$ ground while the PGND node is centered at $\mathrm{C}_{\text {IN }}$ ground. They are connected by a separated layer routing on the bottom through vias.
The exposed pad is connected to AGND through vias.
Detailed description
Figure 14. Top layer and top silkscreen top

Figure 15. Bottom layer and silkscreen top

### 7.3 General description

The STOD03A is a high efficiency dual DC-DC converter which integrates a step-up and inverting power stages suitable for supplying AMOLED panels. Thanks to the high level of integration it needs only 6 external components to operate and it achieves very high efficiency using a synchronous rectification technique for each of the two DC-DC converters.

The controller uses an average current mode technique in order to obtain good stability and precise voltage regulation in all possible conditions of input voltage, output voltage, and output current. In addition, the peak inductor current is monitored in order to avoid saturation of the coils.

The STOD03A implements a power saving technique in order to maintain high efficiency at very light load and it switches to PWM operation as the load increases, in order to guarantee the best dynamic performance and low noise operation.

The STOD03A avoids battery leakage thanks to the true-shutdown feature and it is self protected from overtemperature. Undervoltage lockout and soft-start guarantee proper operation during startup.

### 7.3.1 Multiple operation modes

Both the step-up and the inverting stage of the STOD03A operate in three different modes: pulse skipping mode (PS), discontinuous conduction mode (DCM), and continuous conduction mode (CCM). It switches automatically between the three modes according to input voltage, output current, and output voltage conditions.

## Pulse skipping operation:

The STOD03A works in pulse skipping mode when the load current is below some tens of mA . The load current level at which this way of operating occurs depends on input voltage only for the step-up converter and on input voltage and negative output voltage $\left(\mathrm{V}_{\mathrm{O} 2}\right)$ for the inverting converter.

## Discontinuous conduction mode:

When the load increases above some tens of mA , the STOD03A enters DCM operation. In order to obtain this type of operation the controller must avoid the inductor current going negative. The discontinuous mode detector (DMD) blocks sense the voltage across the synchronous rectifiers (P1B for the step-up and N2 for the inverting) and turn off the switches when the voltage crosses a defined threshold which, in turn, represents a certain current in the inductor. This current can vary according to the slope of the inductor current which depends on input voltage, inductance value, and output voltage.

## Continuous conduction mode:

At medium/high output loads, the STOD03A enters full CCM at constant switching frequency mode for each of the two DC-DC converters.

### 7.3.2 Enable pin

The device operates when the EN pin is set high. If the EN pin is set low, the device stops switching, and all the internal blocks are turned off. In this condition the current drawn from $\mathrm{V}_{\text {INP }} / \mathrm{V}_{\text {INA }}$ is below $1 \mu \mathrm{~A}$ in the whole temperature range. In addition, the internal switches
are in an OFF state so the load is electrically disconnected from the input, this avoids unwanted current leakage from the input to the load.

When the EN is pulled high, the P1B switch is turned on for $100 \mu \mathrm{~s}$. In normal operation, during this time, apart from a small drop due to parasitic resistance, $\mathrm{V}_{\mathrm{MID}}$ reaches $\mathrm{V}_{\mathrm{IN}}$. If, after this $100 \mu \mathrm{~s}, \mathrm{~V}_{\text {MID }}$ stays below $\mathrm{V}_{\mathrm{IN}}$, the P1B is turned off and stays off until a new pulse is applied to the EN. This mechanism avoids STOD03A starting if a short-circuit is present on $\mathrm{V}_{\mathrm{MID}}$.

### 7.3.3 Soft-start and inrush current limiting

After the EN pin is pulled high, or after a suitable voltage is applied to $\mathrm{V}_{\text {INP }}, \mathrm{V}_{\text {INA }}$, and EN , the device initiates the startup phase.

As a first step, the $\mathrm{C}_{\text {MID }}$ capacitor is charged and the P 1 B switch implements a current limiting technique in order to keep the charge current below 400 mA . This avoids the battery overloading during startup.

After $\mathrm{V}_{\text {MID }}$ reaches $\mathrm{V}_{\text {INP }}$ voltage level, the P 1 B switch is fully turned on and the soft-start procedure for the step-up is started. After about 2 ms the soft-start for the inverting is started. The positive and negative voltage is under regulation by around 6 ms after the EN pin is asserted high.

### 7.3.4 Undervoltage lockout

The undervoltage lockout function avoids improper operation of STOD03A when the input voltage is not high enough. When the input voltage is below the UVLO threshold the device is in shutdown mode. The hysteresis of 50 mV avoids unstable operation when the input voltage is close to the UVLO threshold.

### 7.3.5 Overtemperature protection

An internal temperature sensor continuously monitors the IC junction temperature. If the IC temperature exceeds $140^{\circ} \mathrm{C}$, typical, the device stops operating. As soon as the temperature falls below $125^{\circ} \mathrm{C}$, typical, normal operation is restored.

### 7.3.6 Fast discharge

When ENABLE turns from high to low level, the device goes into shutdown mode and LX1 and LX2 stop switching. Then, the discharge switch between $\mathrm{V}_{\text {MID }}$ and $\mathrm{V}_{\text {IN }}$ and the switch between $\mathrm{V}_{\mathrm{O} 2}$ and GND turn on and discharge the positive output voltage and negative output voltage. When the output voltages are discharged to 0 V , the switches turn off and the outputs are high impedance.

## 8 Package mechanical data

In order to meet environmental requirements, ST offers these devices in different grades of ECOPACK ${ }^{\circledR}$ packages, depending on their level of environmental compliance. ECOPACK ${ }^{\circledR}$ specifications, grade definitions and product status are available at: www.st.com. ECOPACK ${ }^{\circledR}$ is an ST trademark.
