

# TONE CONTROL DIGITALLY CONTROLLED AUDIO PROCESSOR

#### 1 FEATURES

- INPUT MULTIPLEXER
  - 4 STEREO INPUTS
  - SELECTABLE INPUT GAIN FOR OPTIMAL ADAPTATION TO DIFFERENT SOURCES
- ONE STEREO OUTPUT
- TREBLE AND BASS CONTROL IN 2.0dB STEPS
- VOLUME CONTROL IN 1.0dB STEPS
- TWO SPEAKER ATTENUATORS:
  - TWO INDEPENDENT SPEAKER CONTROL IN 1.0dB STEPS FOR BALANCE FACILITY
  - INDEPENDENT MUTE FUNCTION
- ALL FUNCTION ARE PROGRAMMABLE VIA SERIAL BUS

#### 2 DESCRIPTION

The TDA7440D is a volume tone (bass and treble) balance (Left/Right) processor for quality audio applications in Hi-Fi systems.

Figure 1. Package

**Table 1. Order Codes** 

Order code	Package
TDA7440D	SO-28
TDA7440D013TR	Tape & Reel

Selectable input gain is provided. Control of all the functions is accomplished by serial bus.

The AC signal setting is obtained by resistor networks and switches combined with operational amplifiers.

Thanks to the used BIPOLAR/CMOS Technology, Low Distortion, Low Noise and DC stepping are obtained

Figure 4. Test Circuit

#### 3 APPLICATION SUGGESTIONS

The first and the last stages are volume control blocks. The control range is 0 to -47dB (mute) for the first one, 0 to -79dB (mute) for the last one. Both of them have 1dB step resolution. The very high resolution allows the implementation of systems free from any noisy acoustical effect.

The TDA7440D audioprocessor provides 3 bands tones control.

#### 3.1 Bass Stage

Several filter types can be implemented, connecting external components to the Bass IN and OUT pins.

The fig.5 refers to basic <u>T Type Bandpass Filter</u> starting from the filter component values (R1 internal and R2,C1,C2 external) the centre frequency Fc, the gain Av at max. boost and the filter Q factor are computed as follows:

$$F_{C} = \frac{1}{2 \cdot \pi \cdot \sqrt{R1 \cdot R2 \cdot C1 \cdot C2}}$$

$$A_{V} = \frac{R2 C2 + R2 C1 + R_{i} C1}{R2 C1 + R2 C2}$$

$$Q = \frac{\sqrt{R1 \cdot R2 \cdot C1 \cdot C2}}{R2 C1 + R2 C2}$$

Viceversa, once Fc, Av, and Ri internal value are fixed, the external components values will be:

$$C1 = \frac{A_{V} - 1}{2 \cdot \pi \cdot F_{C} \cdot R_{i} \cdot Q} \qquad C2 = \frac{Q^{2} \cdot C1}{A_{V} - 1 - Q^{2}} \qquad R2 = \frac{A_{V} - 1 - Q^{2}}{2 \cdot \pi \cdot C1 \cdot F_{C} \cdot (A_{V} - 1) \cdot Q}$$

#### Figure 5.

#### **Treble Stage**

The treble stage is a high pass filter whose time constant is fixed by an internal resistor (25K $\Omega$  typical) and an external capacitor connected between treble pins and ground.

Typical responses are reported in Figg. 14 to 17.

#### **CREF**

The suggested 10mF reference capacitor (CREF) value can be reduced to 4.7mF if the application requires faster power ON.

#### 4 I<sup>2</sup>C BUS INTERFACE

Data transmission from microprocessor to the TDA7440D and vice versa takes place through the 2 wires I<sup>2</sup>C BUS interface, consisting of the two lines SDA and SCL (pull-up resistors to positive supply voltage must be connected).

#### 4.1 Data Validity

As shown in fig. 11, the data on the SDA line must be stable during the high period of the clock. The HIGH and LOW state of the data line can only change when the clock signal on the SCL line is LOW.

#### 4.2 Start and Stop Conditions

As shown in fig. 12 a start condition is a HIGH to LOW transition of the SDA line while SCL is HIGH. The stop condition is a LOW to HIGH transition of the SDA line while SCL is HIGH.

#### 4.3 Byte Format

Every byte transferred on the SDA line must contain 8 bits. Each byte must be followed by an acknowledge bit. The MSB is transferred first.

#### 4.4 Acknowledge

The master ( $\mu$ P) puts a restive HIGH level on the SDA line during the acknowledge clock pulse (see fig. 13). The peripheral (audio processor) that acknowledges has to pull-down (LOW) the SDA line during this clock pulse.

The audio processor which has been addressed has to generate an acknowledge after the reception of each byte, otherwise the SDA line remains at the HIGH level during the ninth clock pulse time. In this case the master transmitter can generate the STOP information in order to abort the transfer.

#### 4.5 Transmission without Acknowledge

Avoiding to detect the acknowledge of the audio processor, the  $\mu P$  can use a simpler transmission: simply it waits one clock without checking the slave acknowledging, and sends the new data.

This approach of course is less protected from misworking.

Figure 12. Timing Diagram of I<sup>2</sup>CBUS

Figure 13. Acknowledge on the I<sup>2</sup>CBUS

#### 5 SOFTWARE SPECIFICATION

Interface Protocol

The interface protocol comprises:

- A start condition (S)
- A chip address byte, containing the TDA7440D
- A subaddress bytes
- A sequence of data (N byte + acknowledge)
- A stop condition (P)

		(	CHIE		DR	ESS	3			SUBADDRESS						DATA 1 to DATA n								
1	MSE	3						LSB		MSE	3			LSB		MSE	3					LSB		
S	1	0	0	0	1	0	0	0	ACK	Χ	Χ	Χ	В	DATA	ACK				DATA				ACK	Р

D96AU420

ACK = Acknowledge

S = Start

P = Stop

A = Address

B = Auto Increment

#### 5.1 EXAMPLES

#### 5.1.1 No Incremental Bus

The TDA7440D receives a start condition, the correct chip address, a subaddress with the B = 0 (no incremental bus), N-datas (all these data concern the subaddress selected), a stop condition.

#### 5.1.2 Incremental Bus

The TDA7440D receive a start conditions, the correct chip address, a subaddress with the B = 1 (incremental bus): now it is in a loop condition with an autoincrease of the subaddress whereas SUBADDRESS from "XXX1000" to "XXX1111" of DATA are ignored.

The DATA 1 concern the subaddress sent, and the DATA 2 concerns the subaddress sent plus one sent in the loop etc, and at the end it receivers the stop condition.
