

Multifunction quad power amplifier with built-in diagnostics features

Datasheet - production data

Flexiwatt25

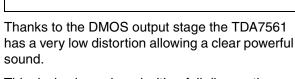

(horizontal)

Features

- Multipower BCD technology
- DMOS power output
- High output power capability 4 x 25 W / 4 Ω @ 14.4 V, 1 kHz, 10 % THD, 4 x 35 W EIAJ
- Max. output power 4 x 60 W / 2 Ω
- Full I²C bus driving:
 - Standby
 - Independent front/rear soft play/mute
 - Selectable gain 26 dB 12 dB (for low noise line output function)
 - I²C bus digital diagnostics
- Full fault protection
- DC offset detection
- Four independent short circuit protection
- Clipping detector
- ESD protection

Description

The TDA7561 is a BCD technology quad bridge type of car radio amplifier in Flexiwatt25 package specially intended for car radio applications.

Flexiwatt25

(vertical)

This device is equipped with a full diagnostics array that communicates the status of each speaker through the I²C bus. The possibility to control the configuration and behaviour of the device by means of the I²C bus makes TDA7561 a very flexible machine.

4 Diagnostics functional description

4.1 Turn-on diagnostic

It is activated at the turn-on (standby out) under I²C bus request. Detectable output faults are:

- Short to GND
- Short to Vs
- Short across the speaker
- Open speaker

To verify if any of the above misconnections are in place, a subsonic (inaudible) current pulse (*Figure 16*) is internally generated, sent through the speaker(s) and sunk back. The Turn On diagnostic status is internally stored until a successive diagnostic pulse is requested (after a I²C reading).

If the "standby out" and "diag. enable" commands are both given through a single programming step, the pulse takes place first (power stage still in stand-by mode, low, outputs = high impedance).

Afterwards, when the Amplifier is biased, the permanent diagnostic takes place. The previous Turn-on state is kept until a short appears at the outputs.

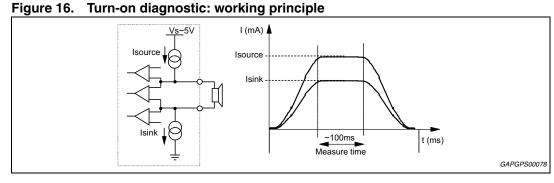

Figure 17 and *18* show SVR and output waveforms at the turn-on (stand-by out) with and without turn-on diagnostic.

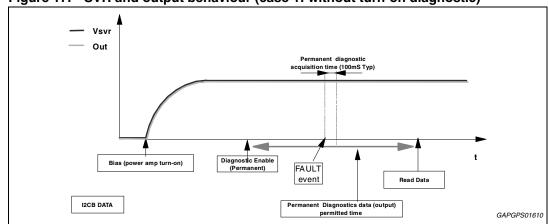

Figure 17. SVR and output behaviour (case 1: without turn-on diagnostic)

577

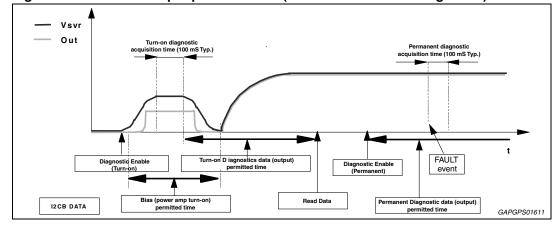

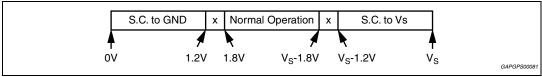

Figure 18. SVR and output pin behaviour (case 2: with turn-on diagnostic)

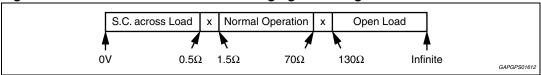

The information related to the outputs status is read and memorized at the end of the current pulse top. The acquisition time is 100 ms (typ.). No audible noise is generated in the process. As for short to GND / Vs the fault-detection thresholds remain unchanged from 26 dB to 12 dB gain setting. They are as follows:

Figure 19. Short circuit detection thresholds

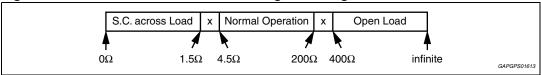

Concerning short across the speaker / open speaker, the threshold varies from 26 dB to 12 dB gain setting, since different loads are expected (either normal speaker's impedance or high impedance). The values in case of 26 dB gain are as follows:

Figure 20. Load detection thresholds - high gain setting

If the line-driver mode (Gv = 12 dB and line driver mode diagnostic = 1) is selected, the same thresholds will change as follows:

Figure 21. Load detection threshold - low gain setting

4.2 Permanent diagnostics

Detectable conventional faults are:

- Short to GND
- Short to Vs
- Short across the speaker

The following additional features are provided:

Output offset detection

The TDA7561 has 2 operating statuses:

- Restart mode. The diagnostic is not enabled. Each audio channel operates independently from each other. If any of the a.m. faults occurs, only the channel(s) interested is shut down. A check of the output status is made every 1 ms (*Figure 22*). Restart takes place when the overload is removed.
- 2. Diagnostic mode. It is enabled via I²C bus and self activates if an output overload (such to cause the intervention of the short-circuit protection) occurs to the speakers outputs. Once activated, the diagnostics procedure develops as follows (*Figure 23*):
 - To avoid momentary re-circulation spikes from giving erroneous diagnostics, a check of the output status is made after 1ms: if normal situation (no overloads) is detected, the diagnostic is not performed and the channel returns back active.
 - Instead, if an overload is detected during the check after 1 ms, then a diagnostic cycle having a duration of about 100 ms is started.
 - After a diagnostic cycle, the audio channel interested by the fault is switched to restart mode. The relevant data are stored inside the device and can be read by the microprocessor. When one cycle has terminated, the next one is activated by an I²C reading. This is to ensure continuous diagnostics throughout the car-radio operating time.
 - To check the status of the device a sampling system is needed. The timing is chosen at microprocessor level (over half a second is recommended).

Figure 22. Restart timing without diagnostic enable (permanent) - Each 1 mS time, a sampling of the fault is done

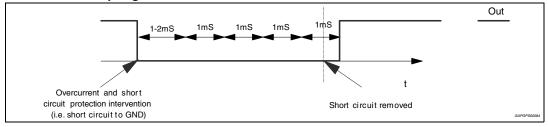

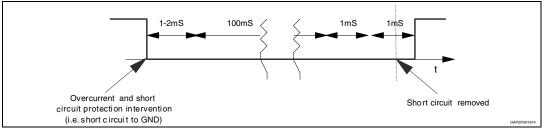

Figure 23. Restart timing with diagnostic enable (permanent)

14/27 Doc ID 8326 Rev 6

4.3 Output DC offset detection

Any DC output offset exceeding ±2 V are signalled out. This inconvenient might occur as a consequence of initially defective or aged and worn-out input capacitors feeding a DC component to the inputs, so putting the speakers at risk of overheating.

This diagnostic has to be performed with low-level output AC signal (or Vin = 0).

The test is run with selectable time duration by microprocessor (from a "start" to a "stop" command):

- Start = Last reading operation or setting IB1 D5 (offset enable) to 1
- Stop = Actual reading operation

Excess offset is signalled out if persistent throughout the assigned testing time. This feature is disabled if any overloads leading to activation of the short-circuit protection occurs in the process.

Multiple faults TDA7561

5 Multiple faults

When more misconnections are simultaneously in place at the audio outputs, it is guaranteed that at least one of them is initially read out. The others are notified after successive cycles of I²C reading and faults removal, provided that the diagnostic is enabled. This is true for both kinds of diagnostic (turn on and permanent).

The table below shows all the couples of possible double-fault. It should be taken into account that a short circuit with the 4 ohm speaker unconnected is considered as double fault.

	S. GND (so)	S. GND (sk)	S. Vs	S. Across L.	Open L.
S. GND (so)	S. GND	S. GND	S. Vs + S. GND	S. GND	S. GND
S. GND (sk)	/	S. GND	S. Vs	S. GND	Open L. ^(*)
S. Vs	/	/	S. Vs	S. Vs	S. Vs
S. Across L.	/	/	/	S. Across L.	N.A.
Open L.	/	/	/	/	Open L. ^(*)

Table 5. Double fault table for turn-on diagnostic

S. GND (so) / S. GND (sk) in the above table make a distinction according to which of the 2 outputs is shorted to ground (test-current source side= so, test-current sink side = sk). More precisely, so = CH+, sk = CH-.

In permanent diagnostic the table is the same, with only a difference concerning Open Load^(*), which is not among the recognizable faults. Should an Open Load be present during the device's normal working, it would be detected at a subsequent Turn on Diagnostic cycle (i.e. at the successive Car Radio Turn on).

5.1 Faults availability

All the results coming from I²C bus, by read operations, are the consequence of measurements inside a defined period of time. If the fault is stable throughout the whole period, it will be sent out.

To guarantee always resident functions, every kind of diagnostic cycles (Turn-on, Permanent, Offset) will be reactivate after any I^2C reading operation. So, when the microprocessor reads the I^2C , a new cycle will be able to start, but the read data will come from the previous diag. cycle (i.e. The device is in turn-on state, with a short to GND, then the short is removed and micro reads I^2C . The short to GND is still present in bytes, because it is the result of the previous cycle. If another I^2C reading operation occurs, the bytes do not show the short). In general to observe a change in diagnostic bytes, two I^2C reading operations are necessary.

TDA7561 I2C bus

6 I²C bus

6.1 I²C programming/reading sequence

A correct turn on/off sequence respectful of the diagnostic timings and producing no audible noises could be as follows (after battery connection):

- Turn-on: (Standby out + Diag enable) --- 500 ms (min) --- Muting out
- Turn-off: Muting in --- 20 ms --- (Diag disable + Standby in)
- Car radio installation: Diag enable (write) --- 200 ms --- I²C read (repeat until All faults disappear).
- Offset test: Device in Play (no signal) -- Offset enable 30 ms I²C reading (repeat I²C reading until high-offset message disappears).

6.2 I²C bus interface

Data transmission from microprocessor to the TDA7561 and viceversa takes place through the 2 wires I²C bus interface, consisting of the two lines SDA and SCL (pull-up resistors to positive supply voltage must be connected).

6.2.1 Data validity

As shown by *Figure 24*, the data on the SDA line must be stable during the high period of the clock.

The High and Low state of the data line can only change when the clock signal on the SCL line is Low.

6.2.2 Start and stop conditions

As shown by *Figure 25* a start condition is a High to Low transition of the SDA line while SCL is HIGH.

The stop condition is a Low to High transition of the SDA line while SCL is High.

6.2.3 Byte format

Every byte transferred to the SDA line must contain 8 bits. Each byte must be followed by an acknowledge bit. The MSB is transferred first.

I2C bus TDA7561

6.2.4 Acknowledge

The transmitter puts a resistive HIGH level on the SDA line during the acknowledge clock pulse (see *Figure 26*). The receive the acknowledges has to pull-down (LOW) the SDA line during the acknowledge clock pulse, so that the SDA line is stable LOW during this clock pulse.

Transmitter:

- master (μP) when it writes an address to the TDA7561
- slave (TDA7561) when the μP reads a data byte from TDA7561

Receiver:

- slave (TDA7561) when the μP writes an address to the TDA7561
- master (μP) when it reads a data byte from TDA7561

Figure 24. Data validity on the I²C bus

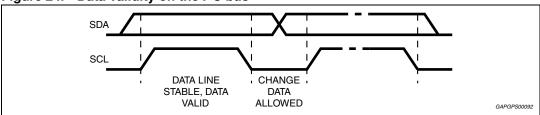

Figure 25. Timing diagram on the I²C bus

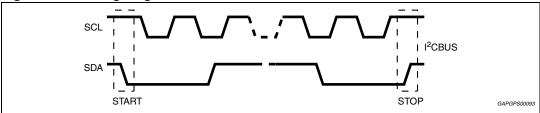

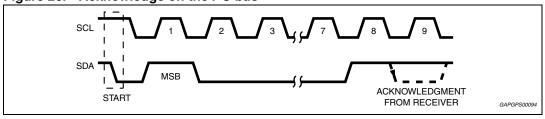

Figure 26. Acknowledge on the I²C bus

7 Software specifications

All the functions of the TDA7561 are activated by I^2C interface.

The bit 0 of the "Address byte" defines if the next bytes are write instruction (from μP to TDA7561) or read instruction (from TDA7561 to μP).

Chip address

X = 0 Write to device

X = 1 Read from device

If R/W = 0, the μ P sends 2 "Instruction Bytes": IB1 and IB2.

Table 6. IB1

D6	Diagnostic enable (D6 = 1) Diagnostic defeat (D6 = 0)
D5	Offset detection enable (D5 = 1) Offset detection defeat (D5 = 0)
D4	Front channel Gain = 26dB (D4 = 0) Gain = 12dB (D4 = 1)
D3	Rear channel Gain = 26dB (D3 = 0) Gain = 12dB (D3 = 1)
D2	Mute front channels (D2 = 0) Unmute front channels (D2 = 1)
D1	Mute rear channels (D1 = 0) Unmute rear channels (D1 = 1)
D0	X

Table 7. IB2

Bit	Instruction decoding bit
D7	X
D6	Used for testing
D5	Used for testing
D4	Standby on - Amplifier not working - (D4 = 0) Standby off - Amplifier working - (D4 = 1)
D3	Power amplifier mode diagnostic (D3 = 0) Line driver mode diagnostic (D3 = 1)
D2	X
D1	X
D0	X

If R/W = 1, the TDA7561 sends 4 "Diagnostics Bytes" to μP : DB1, DB2, DB3 and DB4.

Table 8. DB1

Bit	Instruction decoding bit
D7	Thermal warning active (D7 = 1)
D6	Diag. cycle not activated or not terminated (D6 = 0) Diag. cycle terminated (D6 = 1)
D5	X
D4	Channel LFTurn-on diagnostic (D4 = 0) Permanent diagnostic (D4 = 1)
D3	Channel LF Normal load (D3 = 0) Short load (D3 = 1)
D2	Channel LFTurn-on diag.: No open load (D2 = 0) Open load detection (D2 = 1) Offset diag.: No output offset (D2 = 0) Output offset detection (D2 = 1)
D1	Channel LFNo short to Vcc (D1 = 0)Short to Vcc (D1 = 1)
D0	Channel LFNo short to GND (D1 = 0)Short to GND (D1 = 1)

Table 9. DB2

Bit	Instruction decoding bit
D7	Offset detection not activated (D7 = 0) Offset detection activated (D7 = 1)
D6	X
D5	х
D4	Channel LRTurn-on diagnostic (D4 = 0) Permanent diagnostic (D4 = 1)
D3	Channel LRNormal load (D3 = 0) Short load (D3 = 1)
D2	Channel LRTurn-on diag.: No open load (D2 = 0) Open load detection (D2 = 1) Permanent diag.: No output offset (D2 = 0) Output offset detection (D2 = 1)
D1	Channel LR No short to Vcc (D1 = 0) Short to Vcc (D1 = 1)
D0	Channel LR No short to GND (D1 = 0) Short to GND (D1 = 1)

Table 10. DB3

Bit	Instruction decoding bit
D7	Standby status (= IB1 - D4)
D6	Diagnostic status (= IB1 - D6)
D5	X
D4	Channel RFTurn-on diagnostic (D4 = 0) Permanent diagnostic (D4 = 1)
D3	Channel RFNormal load (D3 = 0) Short load (D3 = 1)
D2	Channel RF Turn-on diag.: No open load (D2 = 0) Open load detection (D2 = 1) Permanent diag.: No output offset (D2 = 0) Output offset detection (D2 = 1)
D1	Channel RFNo short to Vcc (D1 = 0) Short to Vcc (D1 = 1)
D0	Channel RFNo short to GND (D1 = 0) Short to GND (D1 = 1)

Table 11. DB4

Bit	Instruction decoding bit
D7	X
D6	X
D5	X
D4	Channel RR Turn-on diagnostic (D4 = 0) Permanent diagnostic (D4 = 1)
D3	Channel RR Normal load (D3 = 0) Short load (D3 = 1)
D2	Channel RR Turn-on diag.: No open load (D2 = 0) Open load detection (D2 = 1) Permanent diag.:No output offset (D2 = 0) Output offset detection (D2 = 1)
D1	Channel RRNo short to Vcc (D1 = 0) Short to Vcc (D1 = 1)
D0	Channel RRNo short to GND (D1 = 0) Short to GND (D1 = 1)

8 Examples of bytes sequence

1 - Turn-on diagnostic - Write operation

2 - Turn-on diagnostic - Read operation

Start	Address byte with D0 = 1	ACK	DB1	ACK	DB2	ACK	DB3	ACK	DB4	ACK	STOP
	•										

The delay from 1 to 2 can be selected by software, starting from 1 ms

3a - Turn-on of the power amplifier with 26 dB gain, mute on, diagnostic defeat.

Start	Address byte with D0 = 0	ACK	IB1	ACK	IB2	ACK	STOP
'			X000000X		XXX1X0XX		

3b - Turn-off of the power amplifier

Start	Address byte with D0 = 0	ACK	IB1	ACK	IB2	ACK	STOP
			X0XXXXXX		XXX0XXX		

4 - Offset detection procedure enable

Start	Address byte with D0 = 0	ACK	IB1	ACK	IB2	ACK	STOP
			XX1XX11X		XXX1X0XX		

5 - Offset detection procedure stop and reading operation (the results are valid only for the offset detection bits (D2 of the bytes DB1, DB2, DB3, DB4).

|--|

- The purpose of this test is to check if a DC offset (2V typ.) is present on the outputs, produced by input capacitor with anomalous leakage current or humidity between pins.
- The delay from 4 to 5 can be selected by software, starting from 1 ms.

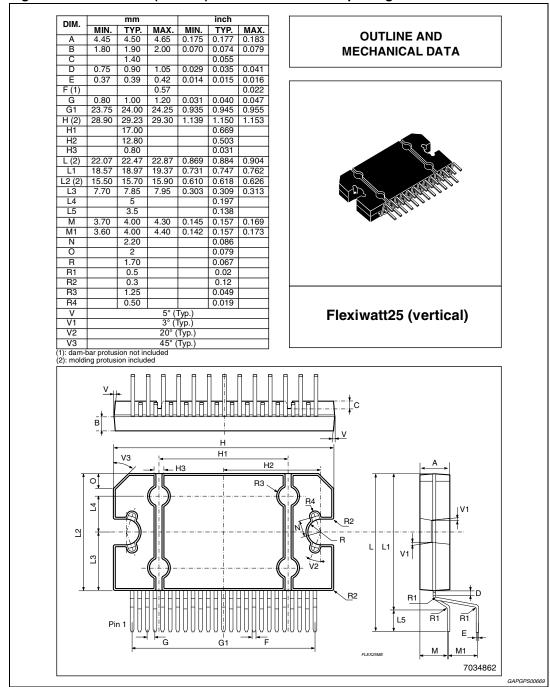

Package information TDA7561

9 Package information

In order to meet environmental requirements, ST offers these devices in different grades of ECOPACK[®] packages, depending on their level of environmental compliance. ECOPACK[®] specifications, grade definitions and product status are available at: www.st.com.

ECOPACK® is an ST trademark.

Please Read Carefully:

Information in this document is provided solely in connection with ST products. STMicroelectronics NV and its subsidiaries ("ST") reserve the right to make changes, corrections, modifications or improvements, to this document, and the products and services described herein at any time, without notice.

All ST products are sold pursuant to ST's terms and conditions of sale.

Purchasers are solely responsible for the choice, selection and use of the ST products and services described herein, and ST assumes no liability whatsoever relating to the choice, selection or use of the ST products and services described herein.

No license, express or implied, by estoppel or otherwise, to any intellectual property rights is granted under this document. If any part of this document refers to any third party products or services it shall not be deemed a license grant by ST for the use of such third party products or services, or any intellectual property contained therein or considered as a warranty covering the use in any manner whatsoever of such third party products or services or any intellectual property contained therein.

UNLESS OTHERWISE SET FORTH IN ST'S TERMS AND CONDITIONS OF SALE ST DISCLAIMS ANY EXPRESS OR IMPLIED WARRANTY WITH RESPECT TO THE USE AND/OR SALE OF ST PRODUCTS INCLUDING WITHOUT LIMITATION IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE (AND THEIR EQUIVALENTS UNDER THE LAWS OF ANY JURISDICTION), OR INFRINGEMENT OF ANY PATENT, COPYRIGHT OR OTHER INTELLECTUAL PROPERTY RIGHT.

ST PRODUCTS ARE NOT DESIGNED OR AUTHORIZED FOR USE IN: (A) SAFETY CRITICAL APPLICATIONS SUCH AS LIFE SUPPORTING, ACTIVE IMPLANTED DEVICES OR SYSTEMS WITH PRODUCT FUNCTIONAL SAFETY REQUIREMENTS; (B) AERONAUTIC APPLICATIONS; (C) AUTOMOTIVE APPLICATIONS OR ENVIRONMENTS, AND/OR (D) AEROSPACE APPLICATIONS OR ENVIRONMENTS. WHERE ST PRODUCTS ARE NOT DESIGNED FOR SUCH USE, THE PURCHASER SHALL USE PRODUCTS AT PURCHASER'S SOLE RISK, EVEN IF ST HAS BEEN INFORMED IN WRITING OF SUCH USAGE, UNLESS A PRODUCT IS EXPRESSLY DESIGNATED BY ST AS BEING INTENDED FOR "AUTOMOTIVE, AUTOMOTIVE SAFETY OR MEDICAL" INDUSTRY DOMAINS ACCORDING TO ST PRODUCT DESIGN SPECIFICATIONS. PRODUCTS FORMALLY ESCC, QML OR JAN QUALIFIED ARE DEEMED SUITABLE FOR USE IN AEROSPACE BY THE CORRESPONDING GOVERNMENTAL AGENCY.

Resale of ST products with provisions different from the statements and/or technical features set forth in this document shall immediately void any warranty granted by ST for the ST product or service described herein and shall not create or extend in any manner whatsoever, any liability of ST.
