## FUNCTIONAL DESCRIPTION

### Input Capacitor

A 1  $\mu\text{F}$  – 10  $\mu\text{F}$  ceramic capacitor is recommended to connect between  $V_{IN}$  and GND pins to decouple input power supply glitch and noise. The amount of the capacitance may be increased without limit. This input capacitor must be located as close as possible to the device to assure input stability and less noise. For PCB layout, a wide copper trace is required for both  $V_{IN}$  and GND.

### Output Capacitor

An output capacitor is required for the stability of the LDO. The recommended output capacitance is from 1  $\mu\text{F}$  to 10  $\mu\text{F}$ , Equivalent Series Resistance (ESR) is from 5 m $\Omega$  to 100 m $\Omega$ , and temperature characteristics are X7R or X5R. Higher capacitance values help to improve load/line transient response. The output capacitance may be increased to keep low undershoot / overshoot. Place output capacitor as close as possible to OUT and GND pins.

### Low Quiescent Current

The SK6512S, consuming only 1.5  $\mu\text{A}$  for all input range or output loading. provides great power saving in portable and low power applications.

### Short Current Limit Protection

When output current at the OUT pin is higher than current limit threshold or the OUT pin is short-circuit to GND, the short current limit protection will be triggered and clamp the output current to approximately 100 mA to prevent over-current and to protect the regulator from damage due to overheating.
