1. ORDERING INFORMATION

SCOPE

This specification describes SC series chip resistors with lead free terminations made by thick film process

APPLICATIONS

All general purpose application

FEATURES

- Halogen Free Epoxy
- RoHS compliant
- Products with lead free terminations meet RoHS requirements
- Pb-glass contained in electrodes, resistors element and glass are exempted by RoHS
- Reducing environmentally hazardous wastes
- High component and equipment reliability Saving of PCB space
- None forbidden-materials used in products/production

NOTE

All our RSMD products meet RoHS compliant and Halogen Free

ORDERING EXAMPLE

The ordering code for a SC0402 0.0625W chip resistor value 100KΩ with ±5% tolerance ,supplied in 7-inch paper tape reel of 10,000 unit per reel is : SC0402J1003F2ANRH

ORDERING INFORMATION-GLOBAL PART NUMBER

Global part numbers are identified by the series, sizes, tolerance ,packing type, temperature coefficient, taping reel and resistance value.

GLOBAL PART NUMBER

| | | | | | | | |
|-----------|-------------|----------|-------------|----------|-----------|----------|-----------|
| SC | XXXX | X | XXXX | X | XX | X | XH |
| | (1) | (2) | (3) | (4) | (5) | (6) | (7) |

(1) SIZE

(2) TOLERANCE

| | |
|---------|---------|
| B=±0.1% | D=±0.5% |
| F=±1.0% | J=±5.0% |

(3) RESISTANCE

There are 2-4digits indicated the resistance value.
Letter R/K/M is decimal point
Example:
9R76 = 9.76 Ω
9761 = 9760 Ω
1004 = 1,000,000 Ω

(4) TEMPERATURE COEFFICIENT OF RESISTANCE

Values of E3,E6,E12,E24 ,E48& E96

To simplify resistor manufacture, handling, purchase & electronic circuit design, resistor values are arranged into standard resistor values conforming to the E series. The different sets of standard resistor values are known by their E-series numbers: E3 has three resistors in each decade, E6 has six, E12 has twelve, and so forth.

Preferred value of resistance shall be composed by significant figures shown in the above table and multipliers including: "X10 ohm , X10² ohm , X10³ ohm , X10⁴ ohm , X10⁵ ohm ."

3. CONSTRUCTION AND DIMENSION

CONSTRUCTION

The resistor is constructed on top of a high-grade ceramic body .Internal metal electrodes are added on each end to make the contacts to the thick film resistive element .The composition of the resistive element is a noble metal imbedded into a glass and covered by a second glass to prevent environmental influences .The resistor is laser trimmed to the rated resistance value .The resistor is covered with a protective epoxy coat, finally the two external termination (matte tin on Ni -barrier) are added , as shown in Fig 1 .

FUNCTIONAL DESCRIPTION

Each type rated power at 70 ±2°C:

Fig3: Maximum dissipation (P) in percentage of rated power as a function of the operating ambient temperature

RATED VOLTAGE

The DC or AC (rms) continuous working voltage corresponding to the rated power is determined by the following formula:

$$V = (P \cdot R)^{1/2}$$

or max. working voltage whichever is less

Where

V=Continuous rated DC or AC

(rms)working voltage (V)

P= Rated power (W)

R = Resistance value (Ω)

MOUNTING

Due to their rectangular shape and small dimensional tolerances, Surface Mounted Resistors are suitable for handling by automatic placement systems. Chip placement can be on ceramic substrates and printed-circuit boards (PCBs). Electrical connection to the circuit is by wave, vapour phase or infrared soldering. The end terminations guarantee a reliable contact and the protective coating enables 'face down' mounting.

The laws of heat conduction, convection and radiation determine the temperature rise in a resistor owing to power dissipation. The maximum body temperature usually occurs in the middle of the resistor and is called the hot-spot temperature. The hot-spot temperature depends on the ambient temperature and the dissipated power. This is described in the data sheet under the chapter heading "Functional description".

The hot-spot temperature is important for mounting because the connections to the chip resistors will reach a temperature close to the hot-spot temperature. Heat conducted by the connections must not reach the melting point of the solder at the

junctions. Therefore a maximum solder joint temperature of 110°C is advised.

The ambient temperature on large or very dense printed-circuit boards (PCBs) is influenced by the dissipated power. The ambient temperature will again influence the hot-spot temperature. Therefore, the packing density that is allowed on the PCB is influenced by the dissipated power.

EXAMPLE OF MOUNTING EFFECTS

Assume that the maximum temperature of a PCB is 95°C and the ambient temperature is 50°C. In this case the maximum temperature rise that may be allowed is 45°C.

In the graph (see Fig.5), this point is found by drawing the line from point A (PCB = 95°C) to point B (T_{amb} = 50°C) and from here to the left axis.

To find the maximum packing density, this horizontal line is extended until it intersects with the curve 0.125 W (point C). The maximum packing density, 19 units/50 × 50 mm² (point D), is found on the horizontal axis.

Fig5: PCB temperature as a function of applied power, mounting density ambient temperature

SOLDERING CONDITIONS

The lead free Surface Mount Resistors are able to stand the reflow soldering conditions as below:

- Temperature: above 220 °C
- Endurance: 95 to 120 seconds
- Cycles: 3 times The test of "soldering heat resistance" is carried out in

accordance with the schedule of "MIL-STD-202G-method 210F", "The robust construction of chip resistors allows them to be completely immersed in a solder bath of 260 °C for 10 seconds". Therefore, it is possible to mount Surface Mount Resistors on one side of a PCB and other discrete components on the reverse (mixed PCBs).

Surface Mount Resistors are tested for solder ability at 245 °C during 2 seconds. The test condition for no leaching is 260 °C for 30 seconds. Typical examples of soldering processes that provide reliable joints without any damage, the recommended soldering profiles referring to "IEC 61760-1" are given in Figs 6, 7 and 8.

NOTE

1. For size 0201, the typical value of thickness (excluding cover tape) is 0.42 mm for paper tape and 0.33 mm for PE tape.
2. M is reversed type.
3. For size 1206, the typical value of thickness (excluding cover tape) is 0.75±0.1.

TESTS AND REQUIREMENTS

ENVIRONMENTAL CONSIDERATIONS

- Cover tape, carrier tape and reel do not contain environmentally harmful PVC materials.
- Cover tape and reel are antistatic.
- Because the carrier tape is made of polycarbonate, a homogeneous material (mono-plastic), it is ideally suited for recycling
- Compared to other PVC-free materials polycarbonate shows excellent stiffness and very little deformation with temperature.

LEADER/TRAILER TAPE SPECIFICATION

Fig11: Leader/trailer tape

TAPING REQUIREMENTS

- Resistance side faces up.
- Component is free and not sticking to top and/or bottom tape.
- Component should be easy to remove from carrier tape and the chip cavity should have no mechanical damage

PEEL-OFF FORCE

- Peel-off forces of both paper/PE and embossed/blister tapes are in accordance with "IEC 60286-3" ; that is, at a peel-off speed of 300 ± 10 mm/minute, 0.1 N to 1.0 N for 8 mm tape and 0.1 N to 1.3 N for tape larger than 8 mm. The peel-off angle should be between 165° and 180° .

TAPE AND REEL SPECIFICATIONS

All tape and reel specifications are in accordance with "IEC 60286-3". Basic dimensions are given in Figs 1, 2 and 5, and Tables 1, 2 and 3.

PAPER/PE TAPE

ADVANTAGE - PE TAP

- Better anti-moisture
- Less fiber
- Meet "ISO 14000" environmental regulation

MATERIAL CHARACTERISTIC - PE TAPE

- PE is a polymer material commonly used for food containers, plastic bags and toys, so is safe for human beings. In addition, it is recyclable.
- Conform to "ISO14000" environmental packing and American F.D.A restraint regulations
