## High Voltage Protection T/R Switch

## Features

- Up to $\pm 100 \mathrm{~V}$ input voltage protection
- Low on resistance - $15 \Omega$ typical
- Fast switching speed
- Effectively, a simple two terminal device
- No external supplies needed

## Applications

- Medical ultrasound imaging
- NDT applications
- Fast resettable fuses
- High side switches
- Data acquisition

## General Description

The Supertex MD0100 is a high voltage, two terminal, bidirectional, current-limiting protection device. The two terminals are interchangeable. It is designed to protect a low noise receiver from the high voltage transmit pulses in ultrasound applications and is commonly referred to as a T/R (transmit and receive) switch.

The MD0100 can be considered as a normally closed switch with a typical switching resistance of $15 \Omega$ that allows small signals to pass. Once the voltage drop across the two terminals exceeds a nominal value of $\pm 2.0 \mathrm{~V}$, the device will start to turn off. In the off state, the MD0100 can withstand up to $\pm 100 \mathrm{~V}$ across its terminals. A small amount of current, typical of $200 \mu \mathrm{~A}$, is allowed to flow through.

The applications for the MD0100 are not limited to just ultrasound. It can also be used for resettable fuses to protect power lines, output short circuit protection, and data acquisition. The MD0100 is available in the SOT-89 package as a single channel device for ease of assembly. It is also available in a $4.0 \times 4.0 \mathrm{~mm} 8$-Lead DFN package as a two channel device for high density requirements.

## Typical Application Circuit

Ordering Information

| Part Number | Package Options | Packing |
| :--- | :--- | :--- |
| MD0100DK6-G <br> (Dual Channel) | 8-Lead (4×4) DFN | 3000/Reel |
| MD0100N8-G <br> (Single Channel) | 3-Lead TO-243AA (SOT-89) | 2000/Reel |

-G denotes a lead (Pb)-free / RoHS compliant package

## Absolute Maximum Ratings ${ }^{1}$

| Parameter | Value |
| :--- | ---: |
| $\mathrm{V}_{\text {AB }}$, differential voltage drop | 0 to $\pm 110 \mathrm{~V}$ |
| Maximum junction temperature | $+125^{\circ} \mathrm{C}$ |
| Storage temperature range | $-65^{\circ} \mathrm{C}$ to $150^{\circ} \mathrm{C}$ |
| Power dissipation, 8-Lead DFN ${ }^{2}$ | 1.1 W |
| Power dissipation, SOT- $89^{2}$ | 1.6 W |

## Notes:

1. Absolute Maximum Ratings are those values beyond which damage to the device may occur. Functional operation under these conditions is not implied. Continuous operation of the device at the absolute rating level may affect device reliability. All voltages are referenced to device ground.
2. Mounted on FR4 board, $25 \mathrm{~mm} \times 25 \mathrm{~mm} \times 1.57 \mathrm{~mm}$

## Typical Thermal Resistance

| Package | $\boldsymbol{\theta}_{\text {ja }}$ |
| :--- | :--- |
| 8-Lead DFN | $44^{\circ} \mathrm{C} / \mathrm{W}$ |
| 3-Lead TO-243AA (SOT-89) | $133^{\circ} \mathrm{C} / \mathrm{W}$ |

## Pin Configuration

## Block Diagram

## Typical I-V Characteristics

## Functional Description

The Supertex MD0100 can be considered as a normally closed switch controlled by a switch control. (Refer to the block diagram.) The switch control monitors the voltage drop across terminals $A$ and $B$. If the voltage difference is greater than $\pm 2.0 \mathrm{~V}$, the $\mathrm{T} / \mathrm{R}$ switch will start to open. Once in the open state, there is a small amount of current flowing through the T/R switch, 200uA, to detect if the high voltage is still present or not. The $T / R$ switch will not close until the voltage across terminal $A$ and $B$ drops within $\pm 2.0 \mathrm{~V}$. A pair of back-to-back diodes from the receive side of the switch to ground are needed to complete the circuit and to allow the initial peak current (about 60 mA ) to flow through the switch so it can drop $\pm 2.0 \mathrm{~V}$. If the diodes are not present, then there is no current path and the voltage drop across terminal A and $B$ will be less than $\pm 2.0 \mathrm{~V}$, so the switch will remain in the closed position.

The other purpose of the diode is to clamp voltage spikes to $\pm 0.7 \mathrm{~V}$ during transmit cycle. A low voltage diode, for example 1.0 V diode, is sufficient since it will only see $\pm 0.7 \mathrm{~V}$. A BAV99T dual diode from Diodes, Inc. was used in our test circuit.

## On Resistance

When the voltage across terminals A and B is within $\pm 2.0 \mathrm{~V}$, the switch is in the receive mode, and the $R_{O N}$ is typically $15 \Omega$. Once the voltage across terminals A and B is greater than $\pm 2.0 \mathrm{~V}$, the switch is in the transmit mode and blocks the high voltage pulses from passing through to the receiver and damaging it.

The MD0100 does not require any power supply. There are only two active pins; one connects to the transmitter side and the other one connects to the receiver side.

## Switch Capacitance

The typical switch ON capacitance $\left(\mathrm{C}_{\text {sw(oN }}\right)$ is 21 pF . This is measured from A to B or B to A when the switch is ON .

The switch OFF capacitance is a function of the voltage across the $T / R$ switch. The $\mathrm{C}_{\text {sw(OFF) }}$ is about 12 to 19 pF for 10 V to 100 V of the transmit voltage. Please see Figure 1 for the $\mathrm{C}-\mathrm{V}$ curve of the $\mathrm{C}_{\text {sw(off) }}$.

Figure 1: $\mathrm{C}_{\mathrm{sw}(\mathrm{OFF})} \mathrm{vs} \mathrm{V}_{\mathrm{sw}}$

## $\mathrm{T}_{\text {ON }}$ and $\mathrm{T}_{\text {OFF }}$ Time

The $\mathrm{T}_{\text {ON }}$ and $\mathrm{T}_{\text {OFF }}$ of the MD0100 are less than 20ns, which provide a fast switch between the transmit mode and the receive mode. The $T_{\text {oN }}$ and $T_{\text {OFF }}$ are input rise/fall time dependent. The MD0100 turns ON and OFF faster when the rise and fall times of the transmit pulse are faster. On the other hand, the switch turns ON and OFF slower if the rise and fall times of the transmit pulse are slower. The $T_{\text {OFF }}$ and $T_{\text {ON }}$ set up are shown in Figure 2 and Figure 5 respectively.

Figure 2: Test set up for $T_{\text {off }}$

Figure 3: $\mathrm{T}_{\text {OFF }}$ Timing Diagram

Figure 4: $T_{\text {OFF }}$ at $V_{A}=10 \mathrm{~V}$

Figure 4 shows the actual waveform and measurement of the $T_{\text {OFF }} T_{\text {OFF }}$ is measured from 2 V of the $\mathrm{V}_{\mathrm{A}}$ to $10 \%$ of the $\mathrm{V}_{\mathrm{B}}$. From the above waveform, the $\mathrm{T}_{\text {OFF }}$ is 11 ns .

Figure 5: Test Set Up for $T_{\text {on }}$

Figure 6: $\mathrm{T}_{\mathrm{ON}}$ Timing Diagram

Figure 7: $\mathrm{T}_{\mathrm{ON}}$ at $\mathrm{V}_{\mathrm{A}}=10 \mathrm{~V}$

Figure 7 shows the actual waveform and measurement of the $T_{O N}$. The $T_{O N}$ is measured from 2 V of the $V_{A}$ to 1 V of the $V_{B}$. From the above waveform, the $T_{\text {oN }}$ is 6.6 ns .

Figure 8: Test Set Up for $I_{\text {PEAK }}$

Figure 9: Typical Application Circuit

Figure 10: Typical Waveform

Figure 10 shows the waveforms of $V_{A}$ and $V_{B}$ of the test circuit shown in Figure 9. There is a small bump of about 0.5 V at the tail of the $\mathrm{V}_{\mathrm{B}}$ signal because the transmit signal falls into the $\pm 2.0 \mathrm{~V}$ range, and the MD0100 turns back ON again. Figure 11 shows a magnified view of the $\mathrm{V}_{\mathrm{A}}$.

Figure 11: Typical Waveform

Figure 11 shows $\mathrm{V}_{\mathrm{A}}$ and $\mathrm{V}_{\mathrm{B}}$ in the same voltage scale, $2.0 \mathrm{~V} /$ DIV.

## Notes:

1. A Pin 1 identifier must be located in the index area indicated. The Pin 1 identifier can be: a molded mark/identifier; an embedded metal marker; or a printed indicator.
2. Depending on the method of manufacturing, a maximum of 0.15 mm pullback (L1) may be present.
3. The inner tip of the lead may be either rounded or square.
