

2.495V Programmable Shunt Voltage Reference

GENERAL DESCRIPTION

TS431 series integrated circuits are three-terminal programmable shunt regulator diodes. These monolithic IC voltage references operate as a low temperature coefficient zener which is programmable from V_{REF} to 36 volts with two external resistors. These devices exhibit a wide operating current range of 0.3 to 100mA with a typical dynamic impedance of 0.22Ω .

The characteristics of these references make them excellent replacements for zener diodes in many applications such as digital voltmeters, power supplies, and op amp circuitry. The 2.495V reference makes it convenient to obtain a stable reference from 5.0V logic supplies, and since The TS431 series operates as a shunt regulator, it can be used as either a positive or negative stage reference.

FEATURES

- Precision Reference Voltage
TS431A – $2.495V \pm 1\%$
TS431B – $2.495V \pm 0.5\%$
- Equivalent Full Range Temp. Coefficient: $50\text{ppm}/^\circ\text{C}$
- Programmable Output Voltage up to 36V
- Fast Turn-On Response
- Sink Current Capability of 1~100mA
- Low Dynamic Output Impedance: 0.2Ω
- Low Output Noise
- RoHS Compliant
- Halogen-free according to IEC 61249-2-21

APPLICATION

- SMPS
- Lighting
- Telecommunication
- Home appliance

BLOCK DIAGRAM

* The deviation parameters ΔV_{REF} and ΔI_{REF} are defined as difference between the maximum value and minimum value obtained over the full operating ambient temperature range that applied.

* The average temperature coefficient of the reference input voltage, αV_{REF} is defined as:

$$\alpha V_{ref} \left(\frac{ppm}{^{\circ}C} \right) = \frac{\left(\frac{\Delta V_{ref}}{V_{ref}} \right)_{(T_A = 25^{\circ}C)} \times 10^6}{\Delta T_A}$$

Where: $T_2 - T_1$ = full temperature change.

αV_{REF} can be positive or negative depending on whether the slope is positive or negative.

Example: Maximum $V_{REF} = 2.496V$ at $30^{\circ}C$, minimum $V_{REF} = 2.492V$ at $0^{\circ}C$, $V_{REF} = 2.495V$ at $25^{\circ}C$, $\Delta T = 70^{\circ}C$

$$\alpha V_{REF} = [4mV / 2495mV] * 10^6 / 70^{\circ}C \approx 23ppm/^{\circ}C$$

Because minimum V_{REF} occurs at the lower temperature, the coefficient is positive.

* The dynamic impedance Z_{KA} is defined as:

$$| Z_{KA} | = \Delta V_{KA} / \Delta I_{KA}$$

* When the device operating with two external resistors, R_1 and R_2 , (refer to Figure 2) the total dynamic impedance of the circuit is given by:

$$| Z_{KA} | = \Delta v / \Delta i \approx Z_{KA} * (1 + R_1 / R_2)$$

ADDITIONAL INFORMATION – STABILITY

When TS431A/431B is used as a shunt regulator, there are two options for selection of C_L , are recommended for optional stability:

- A) No load capacitance across the device, decouple at the load.
- B) Large capacitance across the device, optional decoupling at the load.

The reason for this is that TS431A/431B exhibits instability with capacitances in the range of 10nF to 1µF (approx.) at light cathode current up to 3mA (typ). The device is less stable the lower the cathode voltage has been set for. Therefore while the device will be perfectly stable operating at a cathode current of 10mA (approx.) with a 0.1µF capacitor across it, it will oscillate transiently during start up as the cathode current passes through the instability region. Select a very low capacitance, or alternatively a high capacitance (10µF) will avoid this issue altogether. Since the user will probably wish to have local decoupling at the load anyway, the most cost-effective method is to use no capacitance at all directly across the device. PCB trace/via resistance and inductance prevent the local load decoupling from causing the oscillation during the transient startup phase.

Note: if the TS431A/431B is located right at the load, so the load decoupling capacitor is directly across it, then this capacitor will have to be $\leq 1\text{nF}$ or $\geq 10\mu\text{F}$.

APPLICATIONS EXAMPLES

L.E.D. indicator is 'ON' when V_{in} is between the upper and lower limits,

$$\text{Lower limit} = \left(1 + \frac{R1}{R2}\right) V_{ref}$$

$$\text{Upper limit} = \left(1 + \frac{R3}{R4}\right) V_{ref}$$
