

Features

- Output current greater than 1.5A
- Range Output voltage range adjustable from 1.25V to 37V

Applications

- Power Management for Computer Mother Board, Graphic Card
- LCD Monitor and LCD TV
- DVD Decode Board
- ADSL Modem
- Post Regulators for Switching Supplies

General Description

The LM317 device is an adjustable three-terminal positive-voltage regulator capable of supplying more than 1.5A over an output-voltage range of 1.25V to 37V. LM317 features a very low standby current 1.5mA .

317 is available in SOT89-3, TO220 and SOT223 package.

Absolute Maximum Ratings

Max Input Voltage	40V
Max Operating Junction Temperature(Tj)	150°C
Ambient Temperature(Ta)	-20°C~ 85°C
Storage Temperature(Ts)	-40°C~150°C

Caution: Exceed these limits to damage to the device. Exposure to absolute maximum rating conditions may affect device reliability.

Detailed Description

317 device is an adjustable three-terminal positive-voltage regulator capable of supplying up to 1.5A over an output-voltage range of 1.25V to 37V. It requires only two external resistors to set the output voltage. The device features a typical line regulation of 1mV and typical load regulation of 7 mV.

The 317 device is versatile in its applications, including uses in programmable output regulation and local on-card regulation. Or, by connecting a fixed resistor between the ADJUST and OUTPUT terminals, the 317 device can function as a precision current regulator. An optional output capacitor can be added to improve transient response.

Typical Application

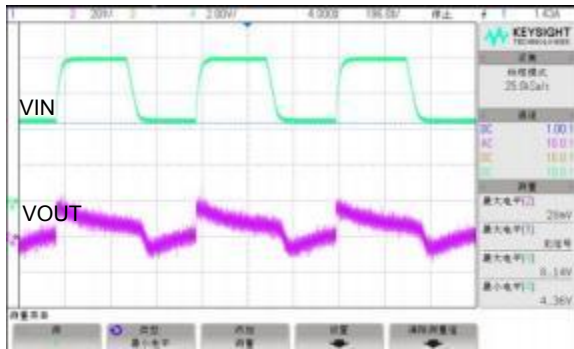

Adjustable Voltage Regulator

1. R₁ and R₂ are required to set the output voltage.
2. C_{ADJ} is recommended to improve ripple rejection. It prevents amplification of the ripple as the output voltage is adjusted higher.
3. C_i is recommended, particularly if the regulator is not in close proximity to the power-supply filter capacitors. A 0.1μF or 1μF ceramic or tantalum capacitor provides sufficient bypassing for most applications, especially when adjustment and output capacitors are used.
4. C_o improves transient response, but is not needed for stability.
5. Protection diode D₂ is recommended if C_{ADJ} is used. The diode provides a low-impedance discharge path to prevent the capacitor from discharging into the output of the regulator.
6. Protection diode D₁ is recommended if C_o is used. The diode provides a low-impedance discharge path to prevent the capacitor from discharging into the output of the regulator.
7. V_o is calculated as shown: $V_o = V_{REF}(1 + R_2/R_1) + (I_{ADJ} \times R_2)$, I_{ADJ} is typically 50μA and negligible in most applications.
