## General Description

The TP8204HS6－Bis a fully integrated，high efficiency 3．0A synchronous rectified step－down converter．The TP8204HS6－Boperates at high efficiency over a wide output current load range．
This device offers two operation modes， PWM control and PFM Mode switching control，which allows a high efficiency over the wider range of the load．
The TP8204HS6－B requires a minimum number of readily available standard external components and is available in a 6－pin

## Applications

－Distributed Power Systems
－Digital Set Top Boxes
－Flat Panel Television and Monitors
－Wireless and DSL Modems
－Notebook Computer

PIN CONFIGURATION

## Features

－High Efficiency：Up to $96 \%$
－500KHz Frequency Operation
－3A Output Current
－No Schottky Diode Required
－ 4.5 V to 17 V Input Voltage Range
－ 0.8 V Reference
－Slope Compensated Current Mode Control for Excellent Line and Load Transient Response Integrated internal compensation
－Stable with Low ESR Ceramic Output
－Capacitors
Over Current Protection with Hiccup－Mode
－Thermal Shutdown Inrush Current Limit and Soft Start
－Available in SOT23－6 Package
－$-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$ Temperature Range

Marking：

| PIN | NAME | FUNCTION |
| :---: | :---: | :--- |
| 1 | GND | Ground |
| 2 | LX | Switching Pin |
| 3 | IN | Power supply Pin |
| 4 | FB | Adjustable version feedback input．Connect FB to the center point of <br> the external resistor divider． |
| 5 | EN | Drive this pin to a logic－high to enable the IC．Drive to a logic－low to <br> disable the IC and enter micro－power shutdown mode． |
| 6 | BS | Bootstrap．A capacitor connected between LX and BST pins is <br> required to form a floating supply across the high－side switch driver． |

TYPICAL APPLICATION

Figure 1．Basic Application Circuit

Figure 1．Basic Application Circuit

## Setting the Output Voltage

The external resistor divider is used to set the output voltage（see Typical Application on page 1）．The feedback resistor R1 also sets the feedback loop bandwidth with the internal compensation capacitor．Choose R1 to be around $100 \mathrm{k} \Omega$ for optimal transient response． R 2 is then given by：

$$
\mathrm{R} 2=\frac{\mathrm{R} 1}{\frac{V_{\text {out }}}{V_{\text {FB }}}-1}
$$

Use a T－type network for when VOUT is low．

Figure 3：T－Type Network

| V out | $\mathbf{R}_{\mathbf{1}}$ | $\mathbf{R}_{\mathbf{2}}$ |
| :---: | :---: | :---: |
| 1.2 V | $100 \mathrm{k} \Omega$ | $200 \mathrm{k} \Omega$ |
| 1.8 V | $100 \mathrm{k} \Omega$ | $78.7 \mathrm{k} \Omega$ |
| 2.5 V | $100 \mathrm{k} \Omega$ | $46.4 \mathrm{k} \Omega$ |
| 3.3 V | $100 \mathrm{k} \Omega$ | $31.6 \mathrm{k} \Omega$ |
| 5 V | $100 \mathrm{k} \Omega$ | $18.7 \mathrm{k} \Omega$ |

Table 1 lists the recommended T－type resistors value for common output voltages．

Absolute Maximum Rating（ $\mathrm{T}_{\mathrm{A}}=25^{\circ} \mathrm{C}$ unless otherwise noted）
