MS5837-30BA

Ultra-small, gel-filled, pressure sensor with stainless steel cap

The MS5837-30BA is a high-resolution pressure and temperature sensor from TE Connectivity (TE) with I²C bus interface. This sensor is optimized for water depth measurement systems with a resolution of 0.2 cm. The sensor module includes a high linearity pressure sensor and an ultra-low power 24-bit $\Delta\Sigma$ ADC with internal factory calibrated coefficients. It provides a precise digital 24-bit pressure and temperature value and different operation modes that allow the user to optimize for conversion speed and current consumption. A high-resolution temperature output allows the implementation in depth measurement systems and thermometer function without any additional sensor. The MS5807-30BA can be interfaced to virtually any microcontroller. The communication protocol is simple, without the need of programming internal registers in the device. The gel protection and antimagnetic stainless-steel cap make the module water resistant.

Small dimensions of only $3.3 \times 3.3 \times 2.75$ mm allow integration in mobile devices. Enhanced construction and design materials allow for enhanced chemical endurance in applications with harsh liquid media environments with limited exposure. This sensor module generation is based on leading MEMS technology from TE proven experience and know-how in high volume manufacturing of sensors modules.

FEATURES

- Ceramic and metal package: 3.3 x 3.3 x 2.75mm
- High resolution module: 0.2 cm (in water)
- Supply voltage: 1.5 to 3.6 V
- Low power: 0.6 μ A (standby \leq 0.1 μ A at 25°C)
- Integrated digital pressure sensor (24-bit $\Delta\Sigma$ ADC)
- Operating range: 0 to 30 bar, -20 to +85 °C
- I²C interface
- No external components (internal oscillator)
- Water resistant sealing with 1.8 x 0.8mm O-ring
- High chemical endurance
- Shielded metal lid

APPLICATIONS

- Dive Computers
- Mobile Water Depth Measurement Systems
- Fitness Trackers
- Wearables

FUNCTIONAL DESCRIPTION

GENERAL

The MS5837-30BA consists of a piezo-resistive sensor and a sensor interface IC. The main function of the MS5837-30BA is to convert the uncompensated analog output voltage from the piezo-resistive pressure sensor to a 24-bit digital value, as well as providing a 24-bit digital value for the temperature of the sensor

FACTORY CALIBRATION

Every module is individually factory calibrated at two temperatures and two pressures. As a result, 6 coefficients necessary to compensate for process variations and temperature variations are calculated and stored in the 112bit PROM of each module. These bits (partitioned into 6 coefficients W1 to W6) must be read by the microcontroller software and used in the program converting D1 and D2 into compensated pressure and temperature values. The coefficients W0 is for factory configuration and CRC.

SERIAL I²C INTERFACE

The external microcontroller clocks in the data through the input SCL (Serial CLock) and SDA (Serial DAta). The sensor responds on the same pin SDA which is bidirectional for the I²C bus interface. So this interface type uses only 2 signal lines and does not require a chip select.

| Module ref | Mode | Pins used | Address (7 bits) |
|-------------|------------------|-----------|------------------|
| MS5837-30BA | I ² C | SDA, SCL | 0x76 (1110110 b) |

COMMANDS

The MS5837-30BA has only five basic commands:

- 1. Reset
- 2. Read PROM (128 bit of calibration words)
- 3. D1 conversion
- 4. D2 conversion
- 5. Read ADC result (24 bit pressure / temperature)

Size of each command is 1 byte (8 bits) as described in the table below. After ADC read commands the device will return 24 bit result and after the PROM read 16bit result. The address of the PROM is embedded inside of the PROM read command using the a2, a1 and a0 bits.

| | Com | mand I | byte | | | | | | hex value |
|-----------------------|---------|--------|------|-----|-------------|-------------|-------------|------|-----------------|
| Bit number | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | |

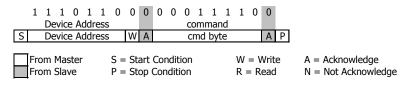

Figure 1: Command Structure

I²C INTERFACE

RESET SEQUENCE

The Reset sequence shall be sent once after power-on to make sure that the calibration PROM gets loaded into the internal register. It can be also used to reset the device PROM from an unknown condition.

The reset can be sent at any time. In the event that there is not a successful power on reset this may be caused by the SDA being blocked by the module in the acknowledge state. The only way to get the MS5837-30BA to function is to send several SCLs followed by a reset sequence or to repeat power on reset.

PROM READ SEQUENCE

The read command for PROM shall be executed once after reset by the user to read the content of the calibration PROM and to calculate the calibration coefficients. There are in total 7 addresses resulting in a total memory of 112 bit. Addresses contain factory data and the setup, calibration coefficients, the serial code and CRC. The command sequence is 8 bits long with a 16 bit result which is clocked with the MSB first. The PROM Read command consists of two parts. First command sets up the system into PROM read mode. The second part gets the data from the system.

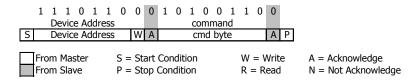

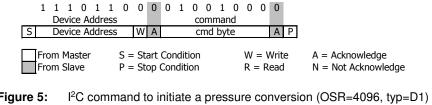

Figure 3: I²C Command to read memory address= 011

| 1 1 1 0 1 1 0 Device Address | 1 0 X X X X X X X X 0 X data | X X X X X X X X 0 data |

| | Start ConditionW = WriteStop ConditionR = Read | A = Acknowledge N = Not Acknowledage |

Figure 4: I²C answer from MS5837-30BA

CONVERSION SEQUENCE

The conversion command is used to initiate uncompensated pressure (D1) or uncompensated temperature (D2) conversion. After the conversion, using ADC read command the result is clocked out with the MSB first. If the conversion is not executed before the ADC read command, or the ADC read command is repeated, it will give 0 as the output result. If the ADC read command is sent during conversion the result will be 0, the conversion will not stop and the final result will be wrong. Conversion sequence sent during the already started conversion process will vield incorrect result as well. A conversion can be started by sending the command to MS5837-30BA. When command is sent to the system it stays busy until conversion is done. When conversion is finished the data can be accessed by sending a Read command, when acknowledge is sent from the MS5837-30BA, 24 SCL cycles may be sent to receive all result bits. Every 8 bits the system waits for an acknowledge signal.

Figure 8: Memory PROM mapping

C Code example for CRC-4 calculation:

```
unsigned char crc4(unsigned int n_prom[])
                                                                       // n_prom defined as 8x unsigned int (n_prom[8])
int cnt;
                                                                        // simple counter
unsigned int n_rem=0;
                                                                        // crc remainder
unsigned char n bit;
          n_prom[0]=((n_prom[0]) & 0x0FFF);
                                                                       // CRC byte is replaced by 0
          n_prom[7]=0;
                                                                       // Subsidiary value, set to 0
          for (cnt = 0; cnt < 16; cnt++)
                                                                       // operation is performed on bytes
                                                                       // choose LSB or MSB
                    {
                                         n_rem ^= (unsigned short) ((n_prom[cnt>>1]) & 0x00FF);
                    if (cnt%2==1)
                                         n_rem ^= (unsigned short) (n_prom[cnt>>1]>>8);
                    else
                    for (n_bit = 8; n_bit > \overline{0}; n_bit - )
                               if (n_rem & (0x8000))
                                                             n_rem = (n_rem << 1) ^ 0x3000;
                                                             n_{rem} = (n_{rem} << 1);
                               else
                               }
                    }
          n_rem= ((n_rem >> 12) & 0x000F);
                                                                       // final 4-bit remainder is CRC code
          return (n_rem ^ 0x00);
}
```

MOUNTING AND ASSEMBLY CONSIDERATIONS

SOLDERING

Please refer to the application note AN808 available on our website for all soldering recommendations.

MOUNTING

The MS5837-30BA can be placed with automatic Pick & Place equipment using vacuum nozzles. It will not be damaged by the vacuum. Due to the low stress assembly the sensor does not show pressure hysteresis effects. It is important to solder all contact pads.

CONNECTION TO PCB

The package outline of the module allows the use of a flexible PCB for interconnection. This can be important for applications in watches and other special devices.

SEALING WITH O-RINGS

In applications such as outdoor watches the electronics must be protected against direct water or humidity. For such applications the MS5837-30BA provides the possibility to seal with an O-ring. The O-ring shall be placed at the groove location, i.e. the small outer diameter of the metal lid. The following O-ring / housing dimensions are recommended:

| O-ring inner diameter | 1.8 ± 0.05 mm |
|-------------------------------|----------------|
| O-ring cross-section diameter | 0.8 ± 0.03 mm |
| Housing bore diameter | 3.07 ± 0.03 mm |

Please refer to the application note available on our website for O-ring mounting recommendations.

CLEANING

The MS5837-30BA has been manufactured under clean-room conditions. It is therefore recommended to assemble the sensor under class 10'000 or better conditions. Should this not be possible, it is recommended to protect the sensor opening during assembly from entering particles and dust. To avoid cleaning of the PCB, solder paste of type "no-clean" shall be used. Warning: cleaning might damage the sensor.

ESD PRECAUTIONS

The electrical contact pads are protected against ESD. It is therefore essential to ground machines and personnel properly during assembly and handling of the device. The MS5837-30BA is shipped in antistatic transport boxes. Any test adapters or production transport boxes used during the assembly of the sensor shall be of an equivalent antistatic material.

DECOUPLING CAPACITOR

Particular care must be taken when connecting the device to the power supply. A minimum of 100nF ceramic capacitor must be placed as close as possible to the MS5837-30BA VDD pin. This capacitor will stabilize the power supply during data conversion and thus, provide the highest possible accuracy.
