### Installation and Maintenance Information

**Installation** — To mount the WD series protective relay on a DIN rail, hook the top edge of the cutout on the base of the case over one edge of the DIN rail, then press the opposite side of the cutout containing the release clip over the opposite side of the DIN rail. To remove or reposition the relay, lever the release clip and move the relay as required. WD series relays should be installed in a dry location where the ambient temperature will be within the operating temperature range.

**Maintenance** — WD series protective relays are solid state devices that require no maintenance. They are not designed to be serviced by the user. Consult KILOVAC customer service at 805-220-2023 if repairs should be necessary.

### Product Facts

- **Function 25**
- **ANSI/IEEE C37.90-1978**

### WD25 Operation

WD25 paralleling relays are used to ensure that two circuits are synchronized. When voltage, phase relationship and frequency are within the selected synchronizing limits, the output relay will energize. The WD25 paralleling relay allows for a generator to be brought online without damage or system disturbance. WD25 series with a “dead bus” feature will energize for a synchronized condition or an “on line” generator, “dead bus” condition. This “dead bus” feature allows the generator to energize a dead bus. The “double dead bus” feature permits paralleling of two buses when: (a) both the line voltages are equal and in phase, or (b) when either bus is “hot” and the other bus is “dead.”

## KILOVAC WD2759 Over/Undervoltage Relays

### Product Facts

- Function 27/59
- ANSI/IEEE C37.90-1978

### WD2759 Operation

WD2759 AC voltage sensing relays provide voltage monitoring and protection in AC systems from 50 to 400 Hz. Sensing voltages, number of phases, over and undervoltage setpoint, and time delays are user configured. WD2759 voltage relays operate when the externally adjustable trip point is reached. An external time delay control is provided with an adjustment of .5 to 10 seconds. This time delay may be used to prevent false tripping when there are slight variations in the voltage supply. On overvoltage (OV) the output relay energizes when the input signal exceeds the trip point. On undervoltage (UV) the output relay energizes when the input signal goes below the trip point. A green LED indicates power to the relay. Red LED lights indicate the state of the undervoltage and overvoltage trips.

## KILOVAC WD32 Reverse Power Relays

### WD32 Operation

WD32 reverse power relays are used to monitor the direction of power from AC generators. This is accomplished by measuring  $I \cos \phi$ . If current from the generator is reversed and exceeds the adjustable setting, the relay will trip. A 0.5 to 20 second time delay is provided. A correct setting of the trip point and time delay will prevent motorizing the generator and prevent tripping during transients that occur while synchronizing. A POWER LED indicates the condition of the power supply and a REVERSE POWER TRIP LED indicates the output status of the relay.

- ANSI/IEEE C37.90-1978

### WD47 Operation

WD47 phase sequence relays are designed to monitor the correct phase rotation and loss of phase of three phase ac systems from 50 to 400 Hz. An incorrect phase sequence or loss of any phase will cause the WD47 to pickup. When the phase sequence is corrected or the lost phase is restored the contacts dropout. Red LED's light to indicate a fault condition. A green LED indicates power to the relay. The WD47 is often used to detect reverse phase rotation or loss of phase to generators, busses, motors, and transformers.

- Maximum Sensing Range** — 575VAC.
- Nominal Frequency Range** — 40-400 Hz.
- Contact Form** — 2 form C (DPDT).

### WD47 Calibration

The WD47 has no adjustments and no calibration is necessary. Proper operation may be verified as follows:

1. Apply a nominal, three-phase input with the correct phase sequence. The output relay should dropout and the green LED should light.
2. Apply a nominal, three-phase input with an incorrect phase sequence. The output relay should pickup and the red LED should light.

WD5051 AC current sensing relays provide current monitoring and protection in AC systems from 50 to 400 Hz. Nominal Sensing Current, Instantaneous Over Current setpoint, Time Over Current setpoint, and Time Over Current time delay are user configured. WD5051 current relays operate when the externally adjustable trip point is reached. An external time over current time delay control is provided with an adjustment of .5 to 20 seconds. This time delay may be used to prevent false tripping when there are slight variations in the sensed current. With control power applied, the Instantaneous Over Current (IOC) contacts pick-up when the input signal exceeds the IOC trip setpoint. ## WOUVT Series, Over/Undervoltage

### Product Facts

- Function 27/59
- ANSI/IEEE C37.90-1978

Voltage sensitive relays are available for both AC and DC applications for overvoltage and undervoltage protection. Combination over/undervoltage relays provide band-pass capabilities. AC relays are either single or three-phase type. Three phase relays are designed to sense the average of the three phases. Voltage trip points are screwdriver adjustable, and operation is time-delayed so that momentary voltage transients will not cause nuisance tripping.

### Operation

The relay will energize at normal voltage condition. The normally closed contact (Form B) will open and the normally open (Form A) will close. The relay will de-energize after time delay when over or undervoltage condition is reached.

## D100X Series, Close Differential

### Product Facts

- ANSI/IEEE C37.90-1978
- UL File No. E58048 
- CSA File No. LR61158 

Close Differential Relays are voltage sensitive. The pick-up and drop-out voltage settings are independently adjustable, which allows precise setting of the differential voltage. This relay is available in a wide range of AC and DC voltages. Their primary application is the sensing and control of transfer switches.

### Operation

Monitors a single phase AC signal, and is used for undervoltage detection. Has separate pick-up and drop-out voltage settings, providing an adjustable hysteresis.

**Note:** Dimensions in inches. Multiply values by 25.4 for dimensions in mm.

### Product Specifications

- Nominal Voltage** — AC, Single Phase, see Ordering Information
- Nominal Frequency** — 50 to 400 Hz.
- Pick-Up Adjustment Range** — 67-100% of nominal voltage
- Drop-Out Adjustment Range** — 67-100% of nominal voltage
- Maximum Differential Setting** — 33% of nominal voltage
- Minimum Differential Setting** — 2% of nominal voltage
- Output Contacts** — Form C (SPDT)
- Contact Ratings** — 5 Amp resistive at 120 VAC or 28 VDC
- Operating Temperature Range** — -20°C to +85°C
- Expected Life** — 10 million operations
- Inverse Time Drop-Out** — The differential relay contains a time delay before operation so that momentary voltage transients do not affect the operation of the relay. The time delay has an inverse time characteristic so that excessive voltage conditions will cause a more rapid drop-out. This time delay is approximately 200mSec. (12 cycles) at the trip settings and decreases to 30 mSec. at approximately 15% beyond the trip settings.

### Notes:

1. Remove black nylon protective screws to gain access to the two internal adjustment potentiometers.
2. Clockwise rotation of the pick-up and drop-out adjustment will raise the voltage trip point.
3. The relay contacts are shown in the de-energized state.

### Product Facts

- Function 50/51
- ANSI/IEEE C37.90-1978
- UL File No. E58048 
- CSA File No. LR61158 

Current sensitive relays are available for single and three phase applications. Voltage controlled overcurrent relays protect generators against fault currents below the full rated value, when the fault produces a voltage drop as in the case of short circuits or grounds. Phase balance relays are available to sense and control unbalanced current flow in three phase systems. Current differential relays operate when the differential between two currents exceeds preset values. Over/under current phase-band relays are also available.

**Note:** Dimensions in inches. Multiply values by 25.4 for dimensions in mm.

## WCD Series

### Product Facts

- Function 87
- ANSI/IEEE C37.90-1978

Current Differential Relays are used for the protection of transformers, motors and generators, by comparing the magnitude of the current entering and leaving the protected circuit. On a given phase winding, any difference between the two currents will indicate an internal fault; the relay will sense the vectorial difference between the two currents of the protected section and will initiate a quick disconnection of the unit, to prevent disastrous consequences.

The relay may also be used to protect internal faults on transformers, such as: ground faults, shorted winding, leakage between primary and secondary, etc. It will sense and compare primary vs. secondary currents, once the turns ratio has been taken into consideration.

### Operation

With control voltage applied, the output contacts (shown in the de-energized position) will remain de-energized as long as the difference between the two input currents remains below the pre-set trip value. The contact will transfer to the energized position when the current difference exceeds the trip value.

## 1800 Series

### Product Facts

- Function 25
- ANSI/IEEE C37.90-1978
- UL File No. E58048 
- CSA File No. LR61158 

### Application

These relays are designed for automatic paralleling (synchronizing) of generators. The relays sense the phase angle displacement and the amplitude difference between two voltages and permit paralleling only when both voltages are equal and in phase. A short time delay is provided to assure that the frequencies are essentially the same at the moment of paralleling. The basic series is designed to parallel two or more energized AC generators. The "Dead Bus" type provides paralleling of AC generators to the main bus. They permit electrical connection of an energized generator to an un-energized line (Dead Bus). If the bus is energized, connection of the generator to the bus is permitted only when both are synchronized.

### Notes

- \*Permits paralleling of two generators only when they are "on-line" and their voltages are equal and in phase (synchronized)
- \*\*Normally used to permit paralleling of a generator to a bus when: (a) both line voltages are equal and in phase, or: (b) when the generator is "on-line" and the bus is "dead"
- \*\*\*Permits paralleling of two power lines (buses) when: (a) both line voltages are equal and in phase, or: (b) when either bus is "hot" and the other bus is "dead"

### Output Contact Options —

2. Two Form B. (Add -B to Model Number)

## WGD Series — Floating Ground

### Product Facts

- ANSI/IEEE C37.90-1978
- UL file No. E58048
- CSA file No. LR61158

Ground Fault Detectors are used to sense leakage current to ground in power transformers and generators. They are available for both AC and DC systems. Some generator systems provide auxiliary power outlets for small equipment. TE Connectivity GFD's eliminate personnel risk of accessing these outlets if a ground fault exists. Diesel locomotives and railroad line signal boxes also use GFD's for operational control purposes. The GFD monitors both positive and negative grounds for fault currents and can trigger either notification or system shut-down if these are detected. GFD's are available for both grounded and ungrounded systems.

### Operation

When the resistance between any phase to ground falls below the set point the relay will energize; The normally closed contacts will open, the normally open contacts will close.

**Note:** Dimensions in inches. Multiply values by 25.4 for dimensions in mm.

Protective Relays

## WC1G Series — Grounded

Ground Fault Detectors are designed to provide very sensitive Ground-Current protection for motor, equipment and personnel from damage or electrical shock. In a ground system, the leakage current is monitored through a toroidal or doughnut current transformer placed around the supply conductors to a motor, transformer, equipment or outlets. Since the sums of the current in a system add to zero, the relay is responsive only to ground-fault current.

### Operation

The output contacts are shown in de-energized position. They will change state when these conditions are met:

1. Control voltage is applied.
2. Leakage current exceed the trip setting.

### Product Specifications

**CT Window Diameter** — 1.7 inches (std) or can be specified by customer
