

2A, 60Vdc, True Output Status Feedback, Short-Circuit Protected DC Solid-State Relay

Part* Number	DESC Drawing Number	Relay Description	
HD00CFW		Solid State Polov (SSP)	
HD00CFY	88062-008	Solid State Relay (SSR)	
HD02CFW		SSR with Switch Status	
HD02CFY	88062-006	SSR with Switch Status	
HD20CFW		SSR with Short Circuit	
HD20CFY	88062-004	Protection	
HD22CFW		SSR with Short Circuit	
HD22CFY	88062-002	Protection and Switch Status	
HD24CFW		SSR with Short Circuit	
HD24CFY		Protection and Trip Status	

\* The Y suffix denotes parameters tested to MIL-PRF-28750

specifications.

The W suffix denotes parameters tested to Teledyne Specifications.

#### ELECTRICAL SPECIFICATIONS (-55°C to +105°C UNLESS OTHERWISE NOTED)

#### INPUT (CONTROL) SPECIFICATIONS

When used in 2 terminal config	guratio	n		
(TTL or direct control)	Min	Тур	Мах	Units
Input Current @ V <sub>IN</sub> = 5 Vdc(See	Fig 2)		14	15
mA				
Turn-Off Voltage (Guaranteed Of	f)		1.5	Vdc
Turn-On Voltage (Guaranteed Or	า) 3.8			Vdc
Reverse Voltage Protection			-32	Vdc
Input Supply Range (See Note 1	) 3.8		32	Vdc
INPUT (CONTROL) SP	ECIFIC	CITA	NS	
When used in 3 terminal config	guratio	n		
(CMOS or open collector TTL) (See Fig. 1)	Min	Тур	Мах	Units
Control Current				
$V_{CONTROL} = 5 Vdc$			250	<b>µ</b> Adc
V <sub>CONTROL</sub> = 18 Vdc			1	mAdc
Control Voltage Range	0		18	Vdc
Bias Supply Voltage (See Note 1)	3.8		32	Vdc
Bias Supply Current @ V <sub>BIAS</sub> = 5 Vdc		14	15	mA
Turn-Off Voltage (Guaranteed Off)	3.2			Vdc
Turn-On Voltage (Guaranteed On)			0.3	Vdc

#### FEATURES

- Available with short-circuit/current overload protection
- Available with status output
- TTL and CMOS compatible control
- Low ON resistance power FET output
- Fast switching speed
- Meets 28 Vdc system requirements of MIL-STD-704
- Optical isolation
- Low profile hermetic package
- Built and tested to the requirements of
- MIL-PRF-28750
- Available to 'W' and 'Y' screening levels

#### DESCRIPTION

This all solid-state relay utilizes the latest technology to

provide a low ON resistance and an optically isolated output. The control (input) and load (output) are optically isolated to protect input logic circuits from voltage and current transients which can occur on the output supply.

The optical isolation also provides a full floating output, thus allowing the load to be connected to either output terminal. The control circuit is buffered to enable the relay to be driven directly from standard CMOS or open collector TTL logic circuits.

Available options include short-circuit and current overload protection, which provides complete protection for both the relay and the system wiring. This feature not only provides

protection should a short or overload occur while the relay is on, but will also provide protection should the relay be switched into a short. In either case, the relay will sense the short-circuit condition and then block it indefinitely until the short is removed and the unit is reset by cycling the input control. The second option is a status output line. This feature is available in either switch status or trip status configurations. Switch status returns the true status of the output switch and is optically isolated from the load. It provides status indication independent of the control circuit of the relay. The status line provides a logic (0) low when the input circuit is off and load circuit continuity is present. The status line provides a logic 1 (high) when the output is on. Trip status, available only with HD24 Series relays, returns a logic 0 (low) if the output trips off and a logic 1 (high) when the output is in a normal mode (on or off). These options are available either together or separately as standard features.

R<sub>(ON)</sub> = NR • R<sub>ON</sub> @ 25°C

5. Overload testing to the requirements of MIL-PRF-28750 is constrained to the limits imposed by the short circuit protection characteristics as defined in this specification. System series inductance for "shorted-load" mode of operation should be 30 mH MAXIMUM. Maximum repetition rate into a shorted load should not exceed 10 Hz.

6. A status pull up resistor is required for proper operation of the status output. Determine the current (Iso) required by the status interface. Calculate the current (Is) through the status resistor such that the sink current through the status output is 0.6 mA. Select the status resistor such that it does not allow more than 0.6 mA to flow through the status output.

$$R_{STATUS} = \frac{V_{STATUS} - 0.4V}{0.6 \ mA - I_{SO}}$$

7. Inductive loads should be diode suppressed. Input transitions should be  $\leq 1$  ms duration and the input drive should be a bounceless contact type.
