### **BQ25883**

ZHCSJL4A - FEBRUARY 2019-REVISED MARCH 2019

# BQ25883 2 节电池, 2A 升压模式电池充电器, 具备电源路径、USB Onthe-Go (OTG) 升压式适用于 USB 输入

- 1 特性
- 高效的 2A 1.5MHz 开关模式升压充电器
  - 在 5V 适配器、7.6V 电池、1A 充电情况下的充 电效率为 93.4%
  - 针对 USB 输入和 2 节锂离子电池进行了优化
  - 用于轻负载运行的可选低功耗 PFM 模式
- 单个输入,支持 USB 输入适配器
  - 支持 3.9V 至 6.2V 输入电压范围,绝对最大输 入电压额定值为 20V
  - 输入电流限制(500mA 至 3.3A, 精度为 100mA),支持 USB2.0、USB3.0标准适配器
  - 通过高达 5.5V 的输入电压限制进行最大功率跟 踪
  - 集成式 USB D+/D- 自动检测 USB SDP、 CDP、DCP 以及非标准适配器
- 电源路径管理和 I<sup>2</sup>C 控制功能
  - 采用 17mΩ 电池放电 MOSFET,具有最高的电 池放电效率
  - 窄 VDC (NVDC) 电源路径管理
    - 无需电池或使用深度放电的电池即可瞬时启 动
    - 电池充电模式下实现理想的二极管运行
- USB On-the-Go (OTG) 功能,可调输出电压范围 为 4.5V 至 5.5V
  - 具有高达 2A 输出的降压转换器
  - 在 5V、1A 输出下效率为 94%
  - 精确的恒定电流 (CC) 调节和输出短路保护
  - 用于轻负载运行的可选低功耗 PFM 模式,具有 无声选项
- 输入电流优化器 (ICO),无需过载适配器即可最大 ٠ 限度地提高输入功率
- 集成式 16 位 ADC,用于系统监控(总线电压和电 流、电池电压、充电电流、系统电压以及 NTC 和 裸片温度)
- 高集成度包括所有 MOSFET、电流检测和环路补偿

- 高精度 •
  - ±0.5% 充电电压调节 \_
  - ±5% 充电电流调节 \_
  - **±7.5%** 输入电流调节 \_
- 安全 •
  - 在充电和 OTG 降压模式下的电池温度检测 \_
  - 热调节和热关断 \_
- 2 应用
- 蓝牙扬声器 •
- EPOS 打印机
- 便携式 POS •
- 无线安防摄像机

# 3 说明

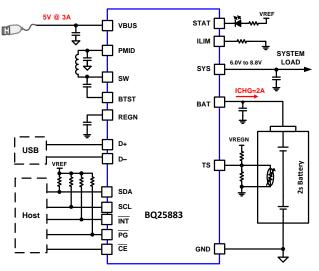

BQ25883 是高度集成的 2A 升压开关模式电池充电管 理和系统电源路径管理器件,适用于两节 (2s) 锂离子 电池和锂聚合物电池。 BQ25883 具有 I<sup>2</sup>C 控制、OTG 和电源路径功能。

# 器件信息(1)

器件型号	封装	封装尺寸(标称值)
BQ25883	VQFN (24)	4.00mm x 4.00mm

# 5 Device Comparison Table

PART NUMBER	BQ25882	BQ25883	BQ25886	BQ25887
VBUS Operating Range	3.9 to 6.2 V	3.9 to 6.2 V	4.3 to 6.2 V	3.9 to 6.2 V
USB Detection	D+/D-	D+/D-	D+/D-	PSEL
Power Path	Yes	Yes	Yes	No
Cell Balancing	No	No	No	Yes
OTG	Up to 2 A	Up to 2 A	Up to 2 A	No OTG
16 bit ADC	Yes	Yes	No	Yes
Control Interface	I2C	I2C	Standalone	12C
Status Pin	/PG	STAT, /PG	STAT, /PG	STAT, /PG
Package	2.1x2.1 WCSP-25	4x4 QFN-24	4x4 QFN-24	4x4 QFN-24

# Table 1. Device Comparison

# 6 Pin Configuration and Functions

### **Pin Functions**

PIN	1	1/0	DESCRIPTION	
NAME	NO.	1/0	DESCRIPTION	
D+	24	AIO	<b>Positive USB data line</b> – D+/D– based USB host/charging port detection. The detection includes data contact detection (DCD) and secondary detection in BC1.2.	
D	1	AIO	<b>Negative USB data line –</b> D+/D– based USB host/charging port detection. The detection includes data contact detection (DCD) and secondary detection in BC1.2.	
STAT	2	DO	<b>n drain charge status indicator</b> – Connect to the pull-up rail via 10-k $\Omega$ resistor. LOW indicates ge in progress. HIGH indicates charge complete or charge disabled. When any fault occurs, the T pin blinks at 1Hz. The STAT function can be disabled when the STAT_DIS bit is set.	
CE	3	DI	<b>tive</b> Low Charge Enable Pin – Battery charging is enabled when EN_CHG bit is 1 and $\overline{CE}$ pin is W. $\overline{CE}$ pin is internally pulled low with 900k- $\Omega$ resistor.	
SDA	4	DIO	<b>I2C Interface Data –</b> Connect SDA to the pull up rail through a 10-k $\Omega$ resistor.	
SCL	5	DI	<b>I2C Interface Clock</b> – Connect SCL to the pull up rail through a $10-k\Omega$ resistor.	
INT	6	DO	<b>Open drain active Interrupt Output</b> – Connect $\overline{INT}$ to the pull up rail via a 10-k $\Omega$ resistor. The $\overline{INT}$ pin sends active low, 256-µs pulse to the host to report charger device status and fault.	
TS	7	AI	<b>Temperature Qualification Voltage</b> – Connect a negative temperature coefficient thermistor. Program temperature window with a resistor divider from REGN to TS to GND. Charge suspends when TS pin is out of range. Recommend 103AT-2 thermistor.	

# Pin Functions (continued)

PIN		1/0	DESCRIPTION			
NAME	NO.	I/O	DESCRIPTION			
ILIM	8	AI	<b>Input Current Limit (IINDPM)</b> – ILIM pin sets the maximum input current and can be used to monitor input current. IINDPM loop regulates ILIM pin voltage at 0.8V. When ILIM pin is less than 0.8V, the input current can be calculated by IIN = KILIM x VILIM / (RILIM x 0.8V). A resistor connected from ILIM pin to ground sets the input current limit as maximum (IINMAX = KILIM / RILIM). When ILIM pin is short to GND, the input current limit is set to maximum by ILIM. The actual input current limit is the lower limit set by ILIM pin (when EN_ILIM bit is HIGH) or IINDPM register bits. Input current limit less than 500mA is not supported on ILIM pin. The ILIM pin function can be disabled when EN_ILIM bit is 0. If ILIM pin is not used, pull this pin to GND.Do not float this pin.			
PG	9	DO	<b>Open drain active low power good indicator</b> – Connect to the pull up rail via $10-k\Omega$ resistor. LOW indicates a good input source if the input voltage is within VVBUS_OP (3.9 V), and can provide more than IPOORSRC (30 mA).			
REGN	11	Р	ate Drive Supply – Bias supply for internal MOSFETs driver and IC. Bypass REGN to GND wit 7-µF ceramic capacitor. REGN current limit is 50 mA.			
BTST	12	Р	<b>PWM High-side Driver Supply</b> – Internally, BTST is connected to the cathode of the boot-strap diode. Connect a 47nF bootstrap capacitor from SW to BTST.			
BAT	13, 14	Р	<b>Battery Power Connection</b> – Connect minimum recommended 10-µF capacitance after derating closely to the BAT pin and GND.			
SYS	15, 16	Р	<b>System Connection</b> – The internal BATFET is connected between SYS and BAT. When the battery falls below the minimum system voltage, the switch-mode converter keeps SYS above the minimum system voltage. Connect a $2x22$ -µF capacitance after derating closely to the SYS pin and PGND.			
SW	17, 18	Р	Inductor Connection – Connect to the switched side of the external inductor.			
GND	19, 20,	_	Ground Return			
PMID	21, 22	Р	<b>Blocking MOSFET Connection</b> – The minimum recommended total input low-ESR capacitance on VBUS and PMID, after applied derating, is 10 uF. At least 1-uF is recommended at VBUS with the remainder at PMID. Typical value for PMID is 10 uF.			
VBUS	23	Р	<b>Input Supply</b> – VBUS is connected to the external DC supply. Bypass VBUS to GND with at least 1- $\mu$ F ceramic capacitor, placed as close to the IC as possible.			
NC	10	-	No Connect – Leave these pins floating or tie to ground.			

# 7 Specifications

# 7.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)

		MIN	MAX	UNIT
	VBUS (converter not switching)	-0.3	20	V
	PMID (converter not switching)	-0.3	8.5	V
	BAT, SYS (converter not switching)	-0.3	12	V
	SW	-0.3	13	V
Voltage Range (with respect to GND unless otherwise specified)	BTST	-0.3	19	V
	REGN, STAT, /PG, TS	-0.3	6	V
	ILIM	-0.3	5	V
	BTST to SW	-0.3	6	V
	D+, D-, /CE, SDA, SCL, /INT	-0.3	6	V
Output Sink Current	/INT, STAT, /PG		6	mA
Junction Temperature, T <sub>J</sub>		-40	150	°C
Storage temperature, T <sub>stg</sub>		-40	150	°C

# 7.2 ESD Ratings

			VALUE	UNIT
		Human body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>	±2000	V
V <sub>(ESD)</sub>	Electrostatic discharge	Charged device model (CDM), per JEDEC specification JESD22-C101 $^{\rm (2)}$	±250	V

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

# 7.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
I <sub>VBUS</sub>	Average input current (VBUS)			3.3	А
I <sub>BAT</sub>	Average charge current (IBAT)			2.2	А
I <sub>BAT_RMS</sub>	RMS discharging current with internal MOSFET		6	6.5	А
I <sub>BAT_PK</sub>	Peak discharging current with internal MOSFET			8 (TBD)	А
V <sub>BAT</sub>	Battery Voltage			9.2 <sup>(1)</sup>	V
T <sub>A</sub>	Operating free-air temperature range	-40		85	°C

(1) The inherent switching noise voltage spikes should not exceed the absolute maximum rating on SW pin. A tight layout minimizes switching noise.

# 7.4 Thermal Information

over operating free-air temperature range (unless otherwise noted)

		BQ25883	
	THERMAL METRIC <sup>(1)</sup>	RGE (VQFN)	UNIT
		24-PIN	
$R_{\ThetaJA}$	Junction-to-ambient thermal resistance	32.4	°C/W
R <sub>@JC(top)</sub>	Junction-to-case (top) thermal resistance	26.7	°C/W
$R_{\Theta JB}$	Junction-to-board thermal resistance	10.7	°C/W
$\Psi_{JT}$	Junction-to-top characterization parameter	0.4	°C/W
$\Psi_{JB}$	Junction-to-board characterization parameter	10.6	°C/W
R <sub>O JC(bot)</sub>	Junction-to-case (bottom) thermal resistance	3.7	°C/W

 For more information about traditional and new thermal metrics, see the Semiconductor and IC Package Thermal Metrics application report, SPRA953.

# 7.5 Electrical Characteristics

 $V_{VBUS_{UVLO_{RISING}}} < V_{VBUS_{OV}}, T_{J} = -40^{\circ}C$  to+125°C, and  $T_{J} = 25^{\circ}C$  for typical values (unless otherwise noted)

	PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT

BQ25883 ZHCSJL4A – FEBRUARY 2019 – REVISED MARCH 2019

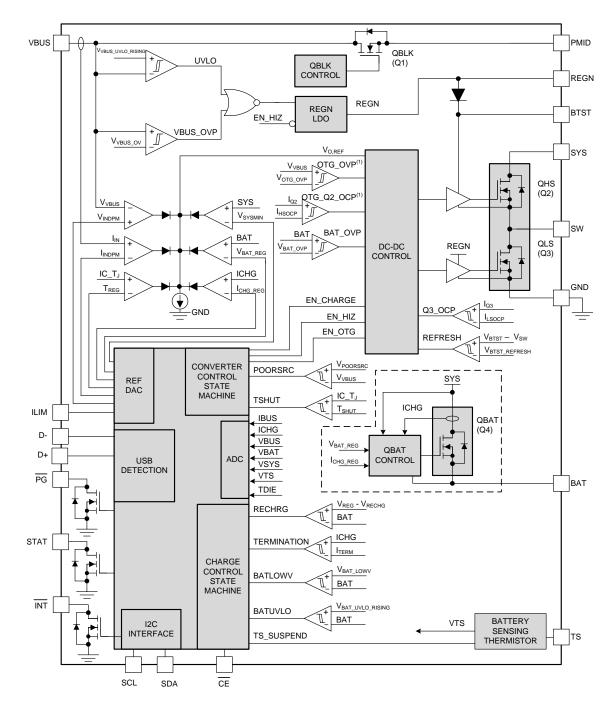

www.ti.com.cn

# 8 Detailed Description

# 8.1 Overview

The BQ25883 device is a highly integrated 2-A switch-mode battery charger for 2s Li-Ion and Li-Polymer battery. It integrates the input blocking FET (Q1, QBLK), high-side switching FET (Q2, QHS), low-side switching FET (Q3, QLS), and battery FET (Q4, QBAT). The device also integrates the boot-strap diode for high-side gate drive.

# 8.2 Functional Block Diagram

### 8.3 Feature Description

### 8.3.1 Device Power-On-Reset

The internal bias circuits are powered from either VBAT or VBUS when it rises above  $V_{VBUS_UVLO_RISING}$  or  $V_{BAT_UVLO_RISING}$ . When VBUS rises above  $V_{VBUS_UVLO_RISING}$  or BAT rises above  $V_{BAT_UVLO_RISING}$ , the BATFET driver is active. I2C interface is ready for communication and all the registers are reset to default value. The host can access all the registers after POR.

### 8.3.2 Device Power Up from Battery without Input Source

If only the battery is present and the voltage is above UVLO threshold ( $V_{BAT_UVLO_RISING}$ ), the BATFET turns on and connects battery to system. The REGN LDO stays off to minimize the quiescent current. The low  $R_{DS(ON)}$  of BATFET and the low quiescent current on BAT minimize the conduction loss and maximize the battery run time.

### 8.3.3 Device Power Up from Input Source

When an input source is plugged in, the device checks the input source voltage to turn on REGN LDO and all the bias circuits. It detects and sets the input current limit before the boost converter is started. The power up sequence from input source is as listed:

- 1. Poor Source Qualification
- Input Source Type Detection based on D+/D- to set default Input Current Limit (IINDPM) register and input source type
- 3. Power Up REGN LDO
- 4. Converter Power-up

### 8.3.3.1 Poor Source Qualification

After REGN LDO powers up, the device checks the current capability of the input source. The input source has to meet the following requirements in order to start the boost converter.

- 1. VBUS voltage below V<sub>VBUS\_OVP</sub>
- 2. VBUS voltage above V<sub>POORSRC</sub> when pulling I<sub>POORSRC</sub> (typical 30mA)

If  $V_{BUS_OVP}$  is detected (condition 1 above), the device automatically retries detection once the over-voltage fault goes away. If a poor source is detected (condition 2 above), the device repeats poor source qualification routine every 2 seconds. After 7 consecutive failures, the device goes to HIZ mode. The battery powers up the system when the device is in HIZ. On BQ25883 adapter re-plugin and/or EN\_HIZ bit toggle is required to restart device operation. The EN\_HIZ bit is cleared automatically when the adapter is plugged in. If the fault is not removed, the part will enter HIZ mode again after the 7 consecutive failures.

### 8.3.3.2 Input Source Type Detection

After input source is qualified, the charger device runs input source type detection.

The BQ25883 follows the USB Battery Charging Specification 1.2 (BC1.2) to detect input source (SDP/CDP/DCP) and non-standard adapter through USB D+/D- lines. After input source type detection, the following registers and pins are changed:

- 1. Input Current Limit (IINDPM) register is changed to set current limit
- Input Voltage Limit (VINDPM) register is changed to set default limit (if EN\_VINDPM\_RST = 1, otherwise VINDPM value remains unchanged)
- 3. VBUS\_STAT bits change to reflect the detected source
- 4. INT pin pulses to notify the host
- 5. PG pin is pulled LOW, and PG\_STAT bit is set to '1'

After detection is completed, the host can over-write IINDPM or VINDPM registers to change the input current, or input voltage limit if needed. The charger input current is always limited by the lower of IINDPM register, ILIM pin, or Input Current Optimizer (ICO) setting when ICO is enabled.

When AUTO\_INDET\_EN is disabled, the Input Source Type Detection is bypassed, and the Input Current Limit (IINDPM) register remains unchanged from previous value. When EN\_VINDPM\_RST is disabled, the Input Voltage Limit (VINDPM) register remains unchanged from previous value.

# Feature Description (接下页)

### 8.3.3.2.1 D+/D- Detection Sets Input Current Limit

The BQ25883 contains a D+/D- based input source detection to program the input current limit. The D+/D- detection has three major steps: Data Contact Detect (DCD), Primary Detection, and Secondary Detection.

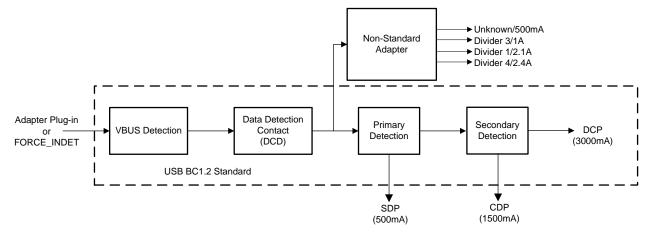

图 16. D+/D- Detection Flow

表:	2.	Non-Standard	Adapter	Detection
----	----	--------------	---------	-----------

NON-STANDARD ADAPTER	D+ THRESHOLD	D- THRESHOLD	INPUT CURRENT LIMIT
Divider 1	$V_{D+}$ within $V_{2P8-VTH}$	$V_{D-}$ within $V_{2P0-VTH}$	2.1A
Divider 3	$V_{D+}$ within $V_{2P0_VTH}$	V <sub>D-</sub> within V <sub>2P8_VTH</sub>	1A
Divider 4	V <sub>D+</sub> within V <sub>2P8_VTH</sub>	$V_{D-}$ within $V_{2P8-VTH}$	2.4A

After the Input Source Type Detection is done, an INT pulse is asserted to the host. In addition, the following registers including Input Current Limit register (IINDPM), and VBUS\_STAT are updated as below:

D+/D- DETECTION	INPUT CURRENT LIMIT (IINDPM)	VBUS_STAT
USB SDP (USB500)	500mA	001
USB CDP	1.5A	010
USB DCP	3.0A	011
Divider 3	1A	110
Divider 1	2.1A	110
Divider 4	2.4A	110
Unknown 5V Adapter	500mA	101

表 3. Input Current Limit Setting from D+/D- Detection

### 8.3.3.2.2 Force Input Current Limit Detection

In host mode, the host can force the device to run Input Current Limit Detection by setting FORCE\_INDET bit. After the detection is completed, FORCE\_INDET bit returns to 0 by itself and input result is updated.

### 8.3.3.3 Power Up REGN Regulator (LDO)

The REGN LDO supplies internal bias circuits as well as the QHS and QLS gate drive. The LDO also provides bias rail to TS external resistors. The pull-up rail of STAT and PG can be connected to REGN as well. The REGN is enabled when all the below conditions are valid.

- 1. VBUS above  $V_{VBUS_{UVLO_{RISING}}}$  in boost mode or VBUS below  $V_{VBUS_{UVLO_{RISING}}}$  in buck mode
- 2. Poor Source Qualification detects a valid input source
- 3. Input Source Type Detection completes and sets appropriate input current limit

### 4. After 220 ms delay is complete

If one of the above conditions is not valid, the device is in high impedance mode (HIZ) with REGN LDO off. The device draws less than  $I_{VBUS\_HIZ}$  from VBUS during HIZ state. The battery powers up the system when the device is in HIZ.

### 8.3.3.4 Converter Power Up

After the input current limit is set, the  $\overline{PG}$  pin is pulled LOW, the PG\_STAT and VBUS\_STAT bits are changed, and the converter is enabled, allowing the HSFET and LSFET to start switching. If battery charging is disabled, BATFET turns off. Otherwise, BATFET stays on to charge the battery. The device provides soft-start when is ramped up.

Before charging begins, the battery discharge source (IBAT\_DISCHG) is enabled automatically to detect the presence of battery. The host can enable IBAT\_DISCHG via the EN\_BAT\_DISCHG bit at any point during operation, including in Battery Only or HIZ modes.

As a battery charger, the device deploys a highly efficient 1.5 MHz boost switching regulator. The fixed frequency oscillator keeps tight control of the switching frequency under all conditions of input voltage, battery voltage, charge current and temperature, simplifying output filter design.

In order to improve light-load efficiency, the device switches to PFM (Pulse Frequency Modulation) control at light load when battery is below minimum system voltage setting or charging is disabled. During the PFM operation, the switching duty cycle is set by the ratio of SYS and VBUS.

### 8.3.4 Input Current Optimizer (ICO)

The device provides innovative Input Current Optimizer (ICO) to identify maximum power point without overloading the input source. The algorithm automatically identifies maximum input current limit of a power source without staying in VINDPM to avoid input source overload.

On BQ25883, this feature is enabled by default (EN\_ICO=1) and can be disabled by setting EN\_ICO bit to 0. After DCP type input source is detected based on the procedures describe above (Input Source Type Detection). The algorithm runs automatically when EN\_ICO bit is set. The algorithm can also be forced to execute by setting FORCE\_ICO bit regardless of input source type detected .

DEVICE	INPUT SOURCE	INPUT CURRENT LIMIT (IINDPM)	AUTOMATIC START ICO ALGORITHM WHEN EN_ICO = 1
	USB SDP (USB500)	500mA	Disable
	USB CDP	1.5A	Disable
	USB DCP	3.0A	Enable
BQ25883 (D+/D–)	Divider 3	1A	Disable
	Divider 1	2.1A	Disable
	Divider 4	2.4A	Disable
	Unknown 5V Adapter	500mA	Disable

表 4. Input Current Optimizer Automatic Operation

The actual input current limit used by the Dynamic Power Management is reported in ICO\_ILIM register while Input Current Optimizer is enabled ( $EN_ICO = 1$ ) or set by IINDPM register when the algorithm is disabled ( $EN_ICO=0$ ). In addition, the current limit is clamped by ILIM pin unless  $EN_ILIM$  bit is 0 to disable ILIM pin function.

When the algorithm is enabled, it runs continuously to adjust input current limit of Dynamic Power Management (IINDPM) using ICO\_ILIM register until ICO\_STAT[1:0] and ICO\_FLAG bits are set (the ICO\_FLAG bit indicates any change in ICO\_STAT[1:0] bits). The algorithm operates depending on battery voltage:

- 1. When voltage at BAT pin is below SYS\_MIN, the algorithm starts ICO\_ILIM register with IINDPM which is the maximum input current limit allowed by system
- 2. When voltage at BAT is above SYS\_MIN, the algorithm starts ICO\_ILIM register with 500mA which is the minimum input current limit to minimize adapter overload

Texas Instruments

www.ti.com.cn

When optimal input current is identified, the ICO\_STAT[1:0] and ICO\_FLAG bits are set to indicate input current limit in ICO\_ILIM register would not be changed until the algorithm is forced to run by the following event (these events also reset the ICO\_STAT[1:0] bits to '01'):

- 1. A new input source is plugged-in, or EN\_HIZ bit is toggled
- 2. IINDPM register is changed
- 3. VINDPM register is changed
- 4. FORCE\_ICO bit is set to 1
- 5. VBUS\_OVP event

### 8.3.5 Buck Mode Operation from Battery (OTG)

The device supports buck converter operation to deliver power from the battery to other portable devices through USB port. The buck mode output current rating meets the USB On-The-Go 500 mA (OTG\_ILIM bits = 000) output requirement. The maximum output current is up to 2.0 A. The buck operation can be enabled if the following conditions are valid:

- 1. BAT above V<sub>OTG BAT</sub>
- 2. VBUS less than  $V_{VBUS_{PRESENT}}$
- 3. ADC is enabled
- 4. Buck mode operation is enabled ( $EN_OTG = 1$  and  $EN_CHG = 0$ )
- 5. Voltage at TS (thermistor) pin is within range configured by Buck Mode Temperature Monitor as configured by BHOT and BCOLD register bits
- 6. After 30 ms delay from buck mode enable

In buck mode, the device employs 1.5 MHz step-down switching regulator based on system requirements. During buck mode, the status register VBUS\_STAT bits are set to 111, the VBUS output is 5.1V by default (selectable via OTG\_VLIM register bits) and the output current can reach up to 2.0 A, selected via I2C (OTG\_ILIM bits). The buck output is maintained when BAT is above  $V_{OTG_BAT}$  threshold, and VBUS is above  $V_{VBUS_{PRESENT}}$  threshold. After OTG startup, the ADC maybe disabled.

### 8.3.6 Power Path Management

The device accommodates a wide range of input sources from USB, to wall adapter, to power bank. The device provides automatic power path selection to supply the system (SYS) from input source (VBUS), battery (BAT), or both.

### 8.3.6.1 Narrow VDC Architecture

The device deploys Narrow VDC architecture (NVDC) with BATFET separating system from battery. The minimum system voltage is set by SYS\_MIN bits. Even with a fully depleted battery, the system is regulated above the minimum system voltage (default 6.2V).

When the battery is below minimum system voltage setting, the BATFET operates in linear mode (LDO mode), and the system is typically 200mV above the minimum system voltage setting. As the battery voltage rises above the minimum system voltage, BATFET is fully on and the voltage difference between the system and battery is the  $V_{DS}$  of BATFET.

When the battery charging is disabled and VBAT is above minimum system voltage setting or charging is terminated, the system is always regulated at typically 50mV above battery voltage. The status register VSYS\_STAT bit goes high when the system is in minimum system voltage regulation.

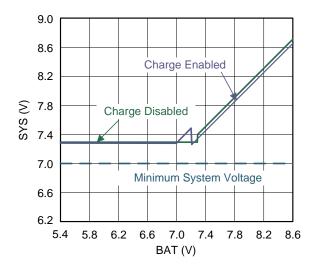

图 17. System Voltage vs. Battery Voltage

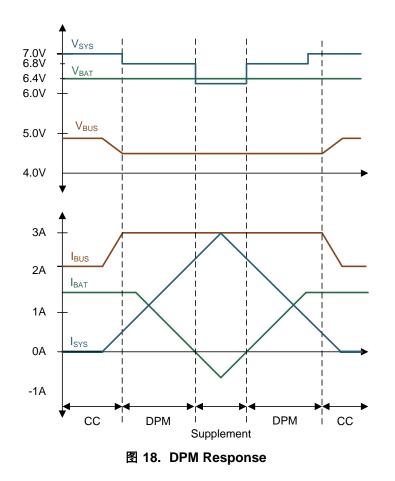

### 8.3.6.2 Dynamic Power Management

To meet the maximum current limit in the USB spec and avoid over loading the adapter, the device features Dynamic Power Management (DPM), which continuously monitors the input current and input voltage. When input source is over-loaded, either the current exceeds the input current limit (IINDPM or ICO\_ILIM or ILIM pin setting) or the voltage falls below the input voltage limit (VINDPM). The device then reduces the charge current until the input current falls below the input current limit and the input voltage rises above the input voltage limit.

When the charge current is reduced to zero, but the input source is still overloaded, the system voltage starts to drop. Once the system voltage falls below the battery voltage, the device automatically enters the Supplement Mode where the BATFET turns on and battery starts discharging so that the system is supported from both the input source and battery.

During DPM mode, the status register bits VINDPM\_STAT (VINDPM) and/or IINDPM\_STAT (IINDPM) go high. The figure shows the DPM response with 5V/3A adapter, 6.4V battery, 1.5A charge current and 6.8V minimum system voltage setting.

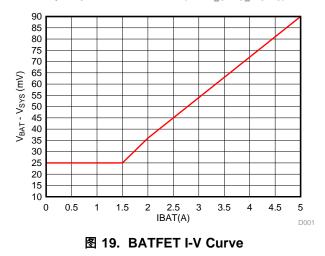

### 8.3.6.3 Supplement Mode

When the voltage falls below the battery voltage, the BATFET turns on.

As the discharge current increases, the BATFET gate is regulated with a higher voltage to reduce  $R_{DSON}$  until the BATFET is in full conduction. At this point onwards, the BATFET  $V_{DS}$  linearly increases with discharge current. The figure shows the V-I curve of the BATFET gate regulation operation. BATFET turns off to exit Supplement Mode when the battery is below battery depletion threshold ( $V_{BAT}$  uvlo RISING).

### 8.3.7 Battery Charging Management

The BQ25883 charges 2-cell Li-Ion battery with up to 2.2-A charge current for high capacity battery. The low R<sub>DS(ON)</sub> BATFET improves charging efficiency and minimize the voltage drop during discharging.

### 8.3.7.1 Autonomous Charging Cycle

When battery charging is enabled (EN\_CHG bit =1 and  $\overline{CE}$  pin is LOW; ), the device autonomously completes a charging cycle without host involvement. The device default charging parameters are listed in Table below. On BQ25883, the host can always control the charging operation and optimize the charging parameters by writing to the corresponding registers through I<sup>2</sup>C.

	5
DEFAULT MODE	BQ25883
Charging Voltage	8.40 V
Charging Current	1.50 A
Pre-Charge Current	150 mA
Termination Current	150 mA
Temperature Profile	JEITA
Safety Timer	12 hours
Topoff Timer	Disabled

表 5. Charging Parameter Default Settings

A new charge cycle starts when the following conditions are valid:

- 1. Converter starts
- Battery charging is enabled by I2C register bit (EN\_CHG = 1 and CE pin is LOW and ICHG register is not 0 mA)
- 3. No thermistor fault on TS
- 4. No safety timer fault

The charger device automatically terminates the charging cycle when the charging current is below termination threshold, charge voltage is above recharge threshold, and device is not in DPM mode or thermal regulation. When a full battery voltage is discharged below recharge threshold (threshold selectable via VRECHG[1:0] bits on BQ25883), the device automatically starts a new charging cycle. After the charge is done, either toggle CE pin or EN\_CHG bit can initiate a new charging cycle.

The STAT output indicates the charging status of: charging (LOW), charging complete or charge disable (HIGH) or charging fault (Blinking). If no battery is connected, the STAT pin blinks as capacitance connected at BAT charges, discharges, then recharges. The STAT output can be disabled by setting STAT\_DIS bit. In addition, the status register (CHRG\_STAT) indicates the different charging phases as:

- 000 Not Charging
- 001 Trickle Charge (VBAT < V<sub>BAT\_SHORT</sub>)
- 010 Pre-charge (V<sub>BAT\_SHORT</sub> < VBAT < V<sub>BAT\_LOWV</sub>)
- 011 Fast-charge (CC mode)
- 100 Taper Charge (CV mode)
- 101 Top-off Timer Charging
- 110 Charge Termination Done

### 8.3.7.2 Battery Charging Profile

The device charges the battery in five phases: trickle charge, pre-charge, constant current, constant voltage, and top-off timer charging. At the beginning of a charging cycle, the device checks the battery voltage and regulates current/voltage accordingly.

VBAT	CHARGING CURRENT	REGISTER DEFAULT SETTING	CHRG_STAT
< V <sub>BAT_SHORT</sub>	I <sub>BAT_SHORT</sub>	100 mA	001
V <sub>BAT_SHORT</sub> – V <sub>BAT_LOWV</sub>	I <sub>PRECHG</sub>	150 mA	010

### 表 6. Default Charging Current Setting

版权 © 2019, Texas Instruments Incorporated

Texas Instruments

www.ti.com.cn

### 表 6. Default Charging Current Setting (接下页)

VBAT	CHARGING CURRENT	REGISTER DEFAULT SETTING	CHRG_STAT
> V <sub>BAT_LOWV</sub>	I <sub>CHG</sub>	1500 mA	011

If the charger device is in DPM regulation or thermal regulation during charging, the actual charging current will be less than the programmed value. In this case, termination is temporarily disabled and the charging safety timer is counted at half the clock rate, as explained in the *Charging Safety Timer* section.

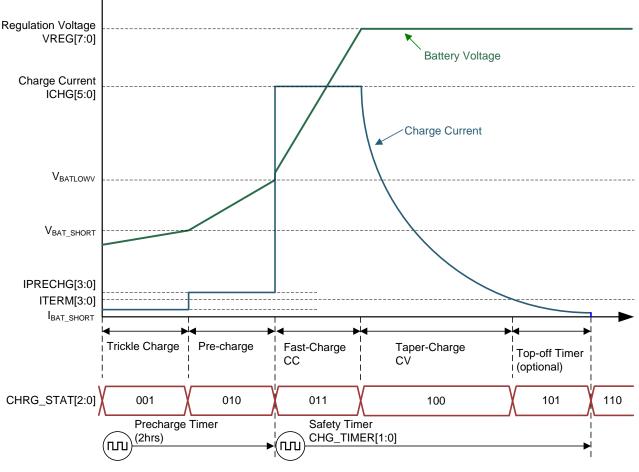

图 20. Battery Charging Profile

## 8.3.7.3 Charging Termination

The device terminates a charge cycle when the battery voltage is above recharge threshold, and the current is below termination current. After the charging cycle is completed, the BATFET turns off. The converter keeps running to power the system, and BATFET can turn on again to engage Supplement Mode.

When termination occurs, the STAT pin goes HIGH (charge <u>current</u> will continue to taper if top-off timer is enabled), status register CHRG\_STAT is set to 110, and an INT pulse is asserted to the host. Termination is temporarily disabled when the charger device is in input current, voltage or thermal regulation. Termination can be permanently disabled by writing 0 to EN\_TERM bit prior to charge termination.

At low termination currents (50mA-100mA), due to the comparator offset, the actual termination current may be up to 20% higher than the termination target. In order to compensate for comparator offset, a programmable topoff timer (default disabled) can be applied after termination is detected. The top-off timer will follow safety timer constraints, such that if safety timer is suspended, so will the top-off timer. Similarly, if safety timer is doubled, so will the top-off timer. CHRG\_STAT reports whether the top off timer is active via the 101 code. Once the Top-Off timer expires, the CHRG\_STAT register is set to 110 and an INT pulse is asserted to the host.

Top-off timer gets reset (set to 0 and counting resumes when appropriate) for any of the following conditions:

- 1. Charge disable to enable
- 2. Termination status low to high
- 3. REG\_RST register bit is set (disables top-off timer)

The top-off timer settings are read in once termination is detected by the charger. Programming a top-off timer value after termination will have no effect unless a recharge cycle is initiated. An INT is asserted to the host when entering top-off timer segment as well as when top-off timer expires. All charge cycle related INT pulses (including top-off timer INT pulses) can be masked by CHRG\_MASK bit.

### 8.3.7.4 Thermistor Qualification

The charger device provides a single thermistor input for battery temperature monitor.

### 8.3.7.4.1 JEITA Guideline Compliance in Charge Mode

To improve the safety of charging Li-ion batteries, JEITA guideline was released on April 20, 2007. The guideline emphasized the importance of avoiding a high charge current and high charge voltage at certain low and high temperature ranges.

To initiate a charge cycle, the voltage on TS pin must be within the VT1 to VT5 thresholds. If TS voltage exceeds the T1-T5 range, the controller suspends charging and waits until the battery temperature is within the T1 to T5 range. At cool temperature (T1-T2), JEITA recommends the charge current to be reduced to half of the charge current or lower. At warm temperature (T3-T5), JEITA recommends charge voltage less than 4.1V / cell.

On BQ25883, the charger provides flexible voltage/current settings beyond the JEITA requirement. The voltage setting at warm temperature (T3-T5) can be VREG, 8.0V, 8.3V, or charge suspend (configured by JEITA\_VSET [1:0]). The fast charge current setting at warm temperature (T3-T5) can be 100%, or 40% of fast charge current, ICHG (configured by JEITA\_ISETH). The fast charge current setting at cool temperature (T1-T2) can be 100%, 40%, or 20% of fast charge current, ICHG, or charge suspend (configured by JEITA\_ISETC[1:0]). Whenever the charger detects "warm" or "cool" temperature, termination is automatically disabled regardless of JEITA\_VSET, JEITA\_ISETH and JEITA\_ISETC register bit settings.

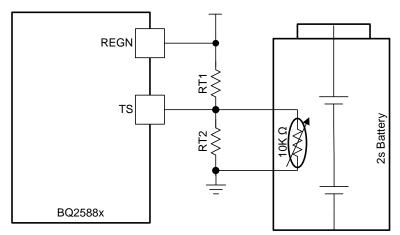

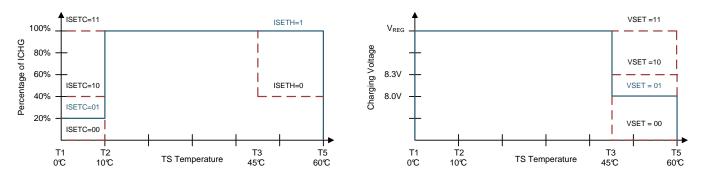

图 21. TS Resistor Network

## 图 22. TS Charging Values

Assuming a 103AT NTC (Negative Temperature Coefficient) thermistor on the battery pack as shown above, the value of RT1 and RT2 can be determined by:

$$RT2 = \frac{R_{NTC,T1} \times R_{NTC,T5} \times \left(\frac{1}{V_{T5}} - \frac{1}{V_{T1}}\right)}{R_{NTC,T1} \times \left(\frac{1}{V_{T1}} - 1\right) - R_{NTC,T5} \times \left(\frac{1}{V_{T5}} - 1\right)}$$
(1)  
$$RT1 = \frac{\frac{1}{V_{T1}} - 1}{\frac{1}{R_{T2}} + \frac{1}{R_{NTC,T1}}}$$
(2)

Select 0°C to 60°C range for Li-ion or Li-polymer battery:

 $R_{NTC,T1} = 27.28 k\Omega$ 

 $R_{NTC,T5} = 3.02 k\Omega$ 

 $RT1 = 5.24 k\Omega$ 

 $RT2 = 30.31 k\Omega$ 

### 8.3.7.4.2 Cold/Hot Temperature Window in OTG Buck Mode

For battery protection during OTG buck mode, the device monitors the battery temperature to be within the VBCOLD to VBHOT thresholds. When temperature is outside of the temperature thresholds, the OTG mode is suspended. In addition, VBUS\_STAT bits are set to 000 and corresponding TS\_STAT is reported. Once temperature returns within thresholds, the OTG mode is recovered and TS\_STAT is cleared.

### Temperature Range for OTG Buck Mode

VREGN	· · · · · · · · · · · · · · · · · · ·

	Buck Disable
GND ——	

图 23. TS Pin Thermistor Sense Threshold in OTG Buck Mode

### 8.3.7.5 Charging Safety Timer

The device has built-in safety timer to prevent extended charging cycle due to abnormal battery conditions. The user can program fast charge safety timer through I<sup>2</sup>C (CHG\_TIMER bits). When safety timer expires, the fault register TMR\_STAT bit is set to 1, and an INT pulse is asserted to the host. The safety timer feature can be disabled by clearing EN\_TIMER bit.

During input voltage, current or thermal regulation, the safety timer counts at half clock rate as the actual charge current is likely to be below the register setting. For example, if the charger is in input current regulation (IINDPM\_STAT=1) throughout the whole charging cycle, and the safety timer is set to 12 hours, then the timer will expire in 24 hours. This half clock rate feature can be disabled by setting TMR2X\_EN = 0. Changing the TMR2X\_EN bit while the device is running has no effect on the safety timer count, other than forcing the timer to count at half the rate under the conditions dictated above.

During faults which disable charging, or supplement mode, timer is suspended. Since the timer is not counting in this state, the TMR2X\_EN bit has no effect. Once the fault goes away, safety timer resumes. If the charging cycle is stopped and started again, the timer gets reset (toggle CE pin or EN\_CHG bit restarts the timer).

The safety timer is reset for the following events:

- 1. Charging cycle stop and restart (toggle CE pin, EN\_CHG bit, or charged battery falls below recharge threshold).
- 2. BAT voltage changes from pre-charge to fast-charge or vice versa (in host-mode or default mode).

The precharge safety timer (fixed 2hr counter that runs when VBAT <  $V_{BAT_LOWV}$ ), follows the same rules as the fast-charge safety timer in terms of getting suspended, reset, and counting at half-rate when TMR2X\_EN is set.

### 8.3.8 Integrated 16-Bit ADC for Monitoring

The device includes a 16-bit ADC to monitor critical system information based on the device's modes of operation. The control of the ADC is done through the *ADC Control Register (Address = 15h) [reset = 30h]*. The ADC\_EN bit provides the ability to enable and disable the ADC to conserve power. The ADC\_RATE bit allows continuous conversion or one-shot behavior. After a one-shot conversion finishes, the ADC\_EN bit is cleared, and must be re-asserted to start a new conversion.

To enable the ADC, the ADC\_EN bit must be set to '1'. The ADC is allowed to operate if either the  $V_{VBUS}$ - $V_{VBUS}$ - $V_{VBUS}$ - $V_{VBUS}$ - $V_{VBUS}$  or  $V_{BAT}$ - $V_{BAT}$ - $V_{VBUS}$  is valid. If no adapter is present, and the VBAT is less than  $V_{BAT}$ - $UVLO_{RISING}$ , the device will not perform an ADC measurement, nor update the ADC read-back values in REG17 through REG24. Additionally, the device will immediately reset ADC\_EN bit without sending any interrupt. The same will happen if the ADC is enabled when all ADC channels are disabled. It is recommended to read back ADC\_EN after setting it to '1' to ensure ADC is running a conversion. If the charger changes mode (for example, if adapter is connected, EN\_HIZ goes to '1', or EN\_OTG goes to '1') while an ADC conversion is running, the conversion is interrupted. Once the mode change is complete, the ADC resumes conversion, starting with the channel where it was interrupted. When device is in HIZ mode, ADC conversion can still be enabled through I2C. In HIZ mode, device power up internally to start ADC convertion and turn back down when ADC conversion is completed.

When TS\_ADC conversion performs in battery only mode, the REGN is powered and extra battery current would be drawn. Battery current can be kept low by disabling the TS\_ADC conversion in battery only mode.

The integrated ADC has two rate conversion options: a one-shot mode and a continuous conversion mode set by the ADC\_RATE bit. By default, all ADC parameters will be converted in one-shot or continuous conversion mode unless disabled in the *ADC Function Disable Register (Address = 16h) [reset = 00h]*. If an ADC parameter is disabled by setting the corresponding bit in REG16, then the read-back value in the corresponding register will be from the last valid ADC conversion or the default POR value (all zeros if no conversions have taken place). If an ADC parameter is disabled in the middle of an ADC measurement cycle, the device will finish the conversion of that parameter, but will not convert the parameter starting the next conversion cycle. Even though no conversion takes place when all ADC measurement parameters are disabled, the ADC circuitry is active and ready to begin conversion as soon as one of the bits in the ADC Function Disable register is set to '0'. If all channels are disabled in one-shot conversion mode, the ADC\_EN bit is cleared.

The ADC\_DONE\_STAT and ADC\_DONE\_FLAG bits signal when a conversion is completed in one-shot mode only. This event produces an INT pulse, which can be masked with ADC\_DONE\_MASK. During continuous conversion mode, the ADC\_DONE\_STAT bit has no meaning and will be '0'. The ADC\_DONE\_FLAG bit will remain unchanged in continuous conversion mode.

ADC conversion operates independently of the faults present in the device. ADC conversion will continue even after a fault has occurred (such as one that causes the power stage to be disabled), and the host must set ADC\_EN = '0' to disable the ADC. ADC conversion is interrupted upon adapter plug-in, and will only resume until after Input Source Type Detection is complete. ADC readings are only valid for DC states and not for transients. When host writes ADC\_EN=0, the ADC stops immediately, and ADC measurement values correspond to last valid ADC reading.

A recommended method to exit ADC conversion is described below:

- 1. Write ADC\_RATE to one-shot, and the ADC will stop at the end of a complete cycle of conversions, or
- 2. Disable all ADC conversion channels, and the ADC will stop at the end of the current measurement.

### 8.3.9 Status Outputs

### 8.3.9.1 Power Good Indicator (PG)

The PG\_STAT bit goes HIGH and open drain  $\overline{PG}$  pin goes low to indicate a good input source when:

- 1. VBUS above  $V_{VBUS_UVLO_RISING}$
- 2. VBUS below  $V_{VBUS_OV}$  threshold
- 3. VBUS above V<sub>POORSRC</sub> (typ. 3.7 V) when I<sub>POORSRC</sub> (typ. 30 mA) current is applied (not a poor source)
- 4. Input Source Type Detection is completed

### 8.3.9.2 Charging Status Indicator (STAT)

The device indicates charging state on the open drain STAT pin. The STAT pin can drive LED.

表	7.	STAT	Pin	State
---	----	------	-----	-------

CHARGING STATE	STAT INDICATOR
Charging in progress (including trickle charge, pre-charge, fast- charge, recharge)	LOW
Charging complete (including top-off)	HIGH
Sleep mode, charge disable	HIGH
Charge suspend (Input over-voltage, TS fault, timer fault or battery over-voltage) OTG Buck Mode suspend (due to TS fault)	Blinking at 1Hz

## 8.3.9.3 Interrupt to Host

In some applications, the host does not always monitor the charger operation. The INT pin notifies the system host on the device operation. By default, the following events will generate an active-low, 256µs INT pulse.

- 1. Good input source detected
  - V<sub>VBUS</sub> < V<sub>VBUS\_OV</sub> threshold
  - V<sub>VBUS</sub> > V<sub>POORSRC</sub> (typ. 3.7 V) when I<sub>POORSRC</sub> (typ. 30 mA) current is applied (not a poor source)
- 2. VBUS\_STAT changes state (VBUS\_STAT any bit change)
- 3. Good input source removed
- 4. Entering IINDPM regulation
- 5. Entering VINDPM regulation
- 6. Entering IC junction temperature regulation (TREG)
- 7. I2C Watchdog timer expired
  - At initial power up, this INT gets asserted to signal I2C is ready for communication
- 8. Charger status changes state (CHRG\_STAT value change), including Charge Complete
- 9. TS\_STAT changes state (TS\_STAT any bit change)
- 10. VBUS over-voltage detected (VBUS\_OVP)
- 11. Junction temperature shutdown (TSHUT)
- 12. Battery over-voltage detected (BATOVP)

- www.ti.com.cn
- 13. Charge safety timer expired
- 14. A rising edge on any of the \*\_STAT bits

Each one of these INT sources can be masked off to prevent INT pulses from being sent out when they occur. Three bits exist for each one of these events:

- The STAT bit holds the current status of each INT source
- The FLAG bit holds information on which source produced an INT, regardless of the current status
- The MASK bit is used to prevent the device from sending out INT for each particular event

When one of the above conditions occurs (a rising edge on any of the \*\_STAT bits), the device sends out an INT pulse and keeps track of which source generated the INT via the FLAG registers. The FLAG register bits are automatically reset to zero after the host reads them, and a new edge on STAT bit is required to re-assert the FLAG.

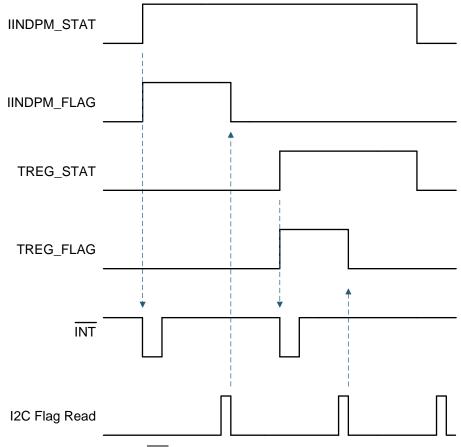

图 24. INT Generation Behavior Example

### 8.3.10 Input Current Limit on ILIM Pin

For safe operation, the BQ2588x has an additional hardware pin on ILIM to limit maximum input current. The maximum input current is set by a resistor from ILIM pin to ground as:

$$I_{\rm INMAX} = \frac{K_{\rm ILIM}}{R_{\rm ILIM}}$$

(3)

INSTRUMENTS

**EXAS** 

www.ti.com.cn

The actual input current limit is the lower value between ILIM pin setting and register setting (IINDPM). For example, if the register setting is 3.3A (0x1C), and ILIM has a  $820-\Omega$  resistor (KILIM = 1276 max) to ground for 1.55A, the input current limit is 1.55A. ILIM pin can be used to set the input current limit rather than the register settings when EN\_ILIM bit is set. The device regulates ILIM pin at 0.8V. If ILIM voltage exceeds 0.8V, the device enters input current regulation (Refer to *Dynamic Power Management* section). Entering IINDPM through ILIM pin sets the IINDPM\_STAT and FLAG bits, and produces and interrupt to host. The interrupt can be masked via the IINDPM\_MASK bit.

The ILIM pin can also be used to monitor input current when EN\_ILIM is set. The voltage on ILIM pin is proportional to the input current. ILIM can be used to monitor input current with the following relationship:

$$I_{IN} = \frac{K_{ILIM} \times V_{ILIM}}{R_{ILIM} \times 0.8V}$$
(4)

For example, if ILIM pin is set with 820- $\Omega$  resistor, and the ILIM voltage 0.5V, the actual input current is 0.795A to 0.973A. If ILIM pin is open, the input current is limited to zero since ILIM voltage floats above 0.8V. If ILIM pin is shorted, the input current limit is set by the register.

The ILIM pin function can be disabled by setting the EN\_ILIM bit to 0. When the pin is disabled, both input current limit function and monitoring function are not available.

## 8.3.11 Voltage and Current Monitoring

The device closely monitors the input voltage and system voltage, as well as internal FET currents for safe boost and buck mode operation.

# 8.3.11.1 Voltage and Current Monitoring in Boost Mode

## 8.3.11.1.1 Input Over-Voltage Protection

The valid input voltage range for boost mode operation is  $V_{VBUS_OP}$ . If VBUS voltage exceeds  $V_{VBUS_OV}$ , the device stops switching immediately to protect the power FETs. During input over-voltage, an INT pulse is asserted to signal the host, and the VBUS\_OVP\_STAT and VBUS\_OVP\_FLAG fault registers get set. The device automatically starts switching again when the over-voltage condition goes away.

### 8.3.11.1.2 Input Under-Voltage Protection

The valid input voltage range for boost mode operation is  $V_{VBUS_OP}$ . If VBUS voltage falls below  $V_{POORSRC}$  during operation, the device stops switching. During input under-voltage, an INT pulse is asserted to signal the host, and the PG\_STAT bit gets cleared. The PG\_FLAG bit will get set to signal this event. The device automatically attempts to restart switching when the under-voltage condition goes away.

## 8.3.11.1.3 System Over-Voltage Protection

The charger device clamps the system voltage during load transient so that the components connect to system would not be damaged due to high voltage. SYSOVP threshold is 350 mV above system regulation voltage. Upon SYSOVP, converter stops immediately to clamp the overshoot.

## 8.3.11.1.4 System Over-Current Protection

The charger device continually monitors and compares VBUS to VSYS to protect against a system short-circuit event. In the event that VSYS drops to within 250 mV of VBUS during operation, a short circuit event is flagged and the converter stops switching. The SYS\_SHORT\_FLAG or SNS\_SHORT\_FLAG bit is set and an INT pulse is asserted to the host. The device attempts to recover from this condition automatically.

## 8.3.11.2 Voltage and Current Monitoring in OTG Buck Mode

The device closely monitors the VBUS voltage, as well as RBFET (Q1, QBLK) and LSFET (Q3, QLS) current to ensure safe buck mode operation.

## 8.3.11.2.1 VBUS Over-voltage Protection

When the VBUS voltage rises above regulation target and exceeds  $V_{OTG_OVP}$ , the device enters over-voltage protection which stops switching, clears the EN\_OTG bit and exits buck mode. During the over-voltage duration, the OTG\_FLAG bits are set high to indicate a fault in buck mode operation. An INT is also asserted to the host.

### 8.3.11.2.2 VBUS Over-Current Protection

The device monitors output current to provide output short protection. The OTG buck mode has built-in constant current regulation to allow OTG to adapt to various types of loads. If short circuit is detected on VBUS, the OTG turns off and retries 7 times. If the retries are not successful, <u>OTG</u> is disabled with EN\_OTG bit cleared. In addition OTG\_FLAG bits are set high to indicate the fault, and an INT is asserted to the host.

### 8.3.12 Thermal Regulation and Thermal Shutdown

### 8.3.12.1 Thermal Protection in Boost Mode

The device monitors internal junction temperature, T<sub>J</sub>, to avoid overheating and limits the IC surface temperature in boost mode. When the internal junction temperature exceeds the preset thermal regulation limit (TREG bits), the device reduces charge current. A wide thermal regulation range from 60°C to 120°C allows optimization for the system thermal performance.

During thermal regulation, the actual charging current is usually below the programmed value in ICHG registers. Therefore, termination is disabled, the safety timer runs at half the clock rate, the status register TREG\_STAT bit goes high, and an INT is asserted to the host.

Additionally, the device has thermal shutdown to turn off the converter when <u>IC</u> surface temperature exceeds  $T_{SHUT}$ . The fault register bits TSHUT\_STAT and TSHUT\_FLAG are set and an INT pulse is asserted to the host. The converter turns back on when IC temperature is below  $T_{SHUT}$  Hys.

### 8.3.12.2 Thermal Protection in OTG Buck Mode

The BQ2588x monitors the internal junction temperature to provide thermal shutdown during OTG buck mode.

### 8.3.13 Battery Protection

### 8.3.13.1 Battery Over-Voltage Protection (BATOVP)

The battery over-voltage limit is clamped at 4% above the battery regulation voltage while charging. When battery over-voltage occurs, the charger device immediately disables charge. The fault register BATOVP\_STAT bit goes high and an INT pulse is asserted to signal the host. The battery regulation voltage can be changed by JEITA\_VSET bits and battery temperature, but BATOVP set point will not change.

### 8.3.13.2 Battery Over-Discharge Protection

When the battery is discharged below  $V_{BAT\_SHORT\_HYS}$ , the BATFET is turned off to protect battery from overdischarge. To recover from over-discharge, an input source is required at VBUS. When an input source is plugged in, the BATFET turns on. The battery is charged with  $I_{BAT\_SHORT}$  current when the VBAT <  $V_{BAT\_SHORT}$ , or pre-charge current as set in IPRECHG registers when the battery voltage is between  $V_{BAT\_SHORT}$  and  $V_{BAT\_LOWV}$ .

### 8.3.14 Serial Interface

The device uses I2C compatible interface for flexible charging parameter programming and instantaneous device status reporting. I2C is a bi-directional 2-wire serial interface. Only two open-drain bus lines are required: a serial data line (SDA), and a serial clock line (SCL). Devices can be considered as masters or slaves when performing data transfers. A master is a device which initiates a data transfer on the bus and generates the clock signals to permit that transfer. At that time, any device addressed is considered a slave.

The device operates as a slave device with address 0x6B, receiving control inputs from the master device like micro-controller or digital signal processor through REG00 – REG25. Register read beyond REG25 (0x25), returns 0xFF. The I2C interface supports both standard mode (up to 100kbits/s), and fast mode (up to 400kbits/s). When the bus is free, both lines are HIGH. The SDA and SCL pins are open drain and must be connected to the positive supply voltage via a current source or pull-up resistor.

### 8.3.14.1 Data Validity

The data on the SDA line must be stable during the HIGH period of the clock. The HIGH or LOW state of the data line can only change when the clock signal on SCL line is LOW. One clock pulse is generated for each data bit transferred.

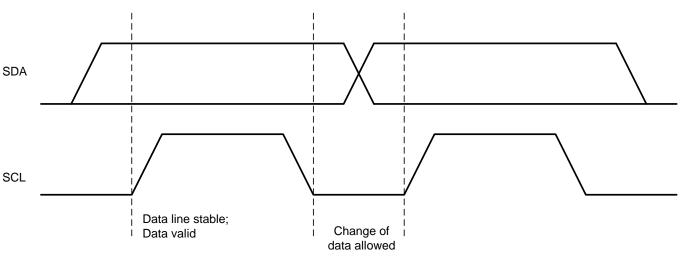

图 25. Bit Transfers on the I2C bus

# 8.3.14.2 START and STOP Conditions

All transactions begin with a START (S) and are terminated with a STOP (P). A HIGH to LOW transition on the SDA line while SCL is HIGH defines a START condition. A LOW to HIGH transition on the SDA line when the SCL is HIGH defines a STOP condition.

START and STOP conditions are always generated by the master. The bus is considered busy after the START condition, and free after the STOP condition.

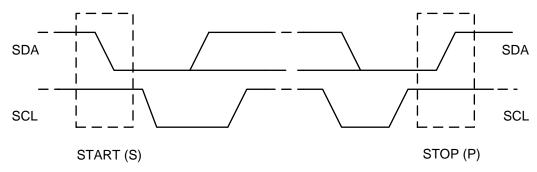

图 26. START and STOP conditions on the I2C bus

### 8.3.14.3 Byte Format

Every byte on the SDA line must be 8 bits long. The number of bytes to be transmitted per transfer is unrestricted. Each byte has to be followed by an ACKNOWLEDGE (ACK) bit. Data is transferred with the Most Significant Bit (MSB) first. If a slave cannot receive or transmit another complete byte of data until it has performed some other function, it can hold the SCL line low to force the master into a wait state (clock stretching). Data transfer then continues when the slave is ready for another byte of data and releases the SCL line.

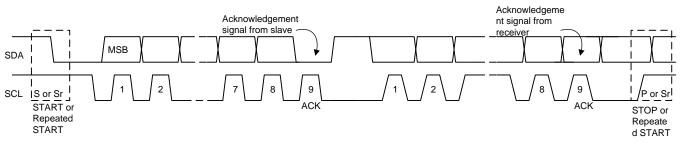

图 27. Data Transfer on the I2C Bus

## 8.3.14.4 Acknowledge (ACK) and Not Acknowledge (NACK)

The ACK signaling takes place after byte. The ACK bit allows the receiver to signal the transmitter that the byte was successfully received and another byte may be sent. All clock pulses, including the acknowledge 9<sup>th</sup> clock pulse, are generated by the master.

The transmitter releases the SDA line during the acknowledge clock pulse so the receiver can pull the SDA line LOW and it remains stable LOW during the HIGH period of this 9<sup>th</sup> clock pulse.

A NACK is signaled when the SDA line remains HIGH during the 9<sup>th</sup> clock pulse. The master can then generate either a STOP to abort the transfer or a repeated START to start a new transfer.

### 8.3.14.5 Slave Address and Data Direction Bit

After the START signal, a slave address is sent. This address is 7 bits long, followed by the 8 bit as a data direction bit (bit R/W). A zero indicates a transmission (WRITE) and a one indicates a request for data (READ). The device 7-bit address is defined as 1101 011' (0x6B) by default. The address bit arrangement is shown below.

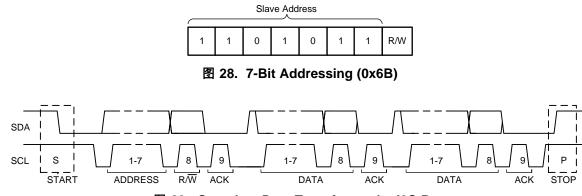

图 29. Complete Data Transfer on the I2C Bus

If the register address is not defined, the charger IC sends back NACK and returns to the idle state.

### 8.3.14.7 Multi-Write and Multi-Read

The charger device supports multi-read and multi-write of all registers.

### 图 32. Multi-Write

### 图 33. Multi-Read

### 8.4 Device Functional Modes

### 8.4.1 Host Mode and Default Mode

The BQ2588x is a host controlled charger, but it can operate in default mode without host management. In default mode, the device can be used as an autonomous charger with no host or while host is in sleep mode. When the charger is in default mode, WD\_STAT bit is HIGH. When the charger is in host mode, WD\_STAT bit is LOW.

After power-on-reset, the device starts in default mode with watchdog timer expired, or default mode. All the registers are in the default settings.

In default mode, the device keeps charging the battery with default 12-hour fast charging safety timer. At the end of the 12-hour, the charging is stopped and the boost converter continues to operate to supply system load.

A I2C write to the registers transitions the charger from default mode to host mode and watchdog timer is reset. All the device parameters can be programmed by the host. To keep the device in host mode, the host has to reset the watchdog timer by writing 1 to WD\_RST bit before the watchdog timer expires (WD\_STAT bit is set), or disable watchdog timer by setting WATCHDOG bits=00.

# Device Functional Modes (接下页)

When the watchdog timer (WD\_STAT bit = 1) is expired, the device returns to default mode and all registers are reset to default values except as detailed in the *Register Maps* section. The Watchdog timer will be reset on any write if the watchdog timer has expired.

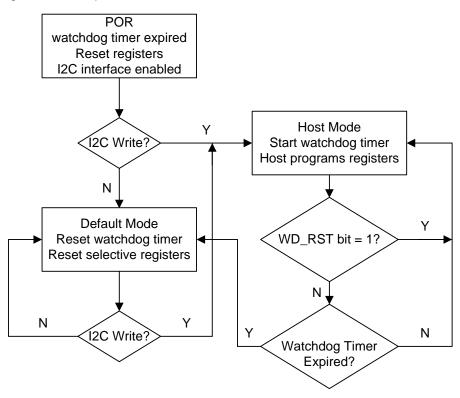

图 34. Watchdog Timer Flow Chart

Reset		A0h						
Field				VRE	G[7:0]			

### 表 10. REG00 Register Field Descriptions

Bit	Field	Туре	Reset by REG_RST	Reset by WATCHDOG	Description	1
7	VREG[7]	R/W	Yes	Yes	1280 mV	Battery Charge voltage limit
6	VREG[6]	R/W	Yes	Yes	640 mV	Offset: 6.80 V
5	VREG[5]	R/W	Yes	Yes	320 mV	Range: 6.80 V to 9.20 V Default 8.40 V
4	VREG[4]	R/W	Yes	Yes	160 mV	
3	VREG[3]	R/W	Yes	Yes	80 mV	
2	VREG[2]	R/W	Yes	Yes	40 mV	
1	VREG[1]	R/W	Yes	Yes	20 mV	
0	VREG[0]	R/W	Yes	Yes	10 mV	

## 8.5.2 Charger Current Limit Register (Address = 01h) [reset = 5Eh]

REG01 is shown in 图 36 and described in 表 11.

Return to Summary Table.

### 图 36. REG01 Register

Bit	7	6	5	4	3	2	1	0
Reset	0h	1h			1E	Eh		
Field	EN_HIZ	EN_ILIM			ICHG	G[5:0]		

#### 表 11. REG01 Register Field Descriptions

Bit	Field	Туре	Reset by REG_RST	Reset by WATCHDOG	Description	
7	EN_HIZ	R/W	Yes	Yes	Enable HIZ Mode: 0 – Disable (default) 1 – Enable	
6	EN_ILIM	R/W	Yes	Yes	Enable ILIM Pin Function: 0 – Disable 1 – Enable (default)	
5	ICHG[5]	R/W	Yes	Yes	1600 mA	Fast Charge Current Limit
4	ICHG[4]	R/W	Yes	Yes	800 mA	Offset: 100 mA
3	ICHG[3]	R/W	Yes	Yes	400 mA	Range: 100mA – 2200mA Default 1500 mA
2	ICHG[2]	R/W	Yes	Yes	200 mA Note: ICHG > 2.2A (2Ch) clamped to 2.2A. ICHG < 100m.	
1	ICHG[1]	R/W	Yes	Yes	100 mA clamped at 100mA	
0	ICHG[0]	R/W	Yes	Yes	50 mA	

## 8.5.3 Input Voltage Limit Register (Address = 02h) [reset = 84h]

REG02 is shown in 图 37 and described in 表 12.

Return to Summary Table.

#### 图 37. REG02 Register

Bit	7	6	5	4	3	2	1	0			
Reset	1h	0h	0h Oh		04h						
Field	EN_VINDPM_R ST	EN_BAT_DISC HG	PFM_OOA_DIS			VINDPM[4:0]					

Bit	Field	Туре	Reset by REG_RST	Reset by WATCHDOG	OG Description			
7	EN_VINDPM_RST	R/W	Yes	Yes	Enable VINDPM automatic reset upon adapter plugin: 0 – Disable VINDPM reset when adapter is plugged in 1 – Enable VINDPM reset when adapter is plugged in (VINDPM resets to de value after Input Source Type Detection) (Default)			
6	EN_BAT_DISCHG	R/W	Yes	Yes	s Enable BAT pin discharge load (IBAT_DISCHG): 0 – Disable load (Default) 1 – Enable BAT discharge load			
5	PFM_OOA_DIS	R/W	Yes	No	0 - Out-of-a	-Audio (OOA) Mode Disable: audio mode enabled while converter is in PFM (Default) audio mode disabled while converter is in PFM		
4	VINDPM[4]	R/W	Yes	No	1600 mV	Absolute Input Voltage Limit:		
3	VINDPM[3]	R/W	Yes	No	800 mV Offset: 3.9 V			
2	VINDPM[2]	R/W	Yes	No	400 mV Range: 3.9V – 5.5V Default: 4.3 V			
1	VINDPM[1]	R/W	Yes	No	200 mV Note: VINDPM > 5.5V (10h) clamped to 5.5V. VINDPM reg			
0	VINDPM[0]	R/W	Yes	No	100 mV	reset upon adapter plug-in if EN_VINDPM_RST = 1.		

#### 表 12. REG02 Register Field Descriptions

## 8.5.4 Input Current Limit Register (Address = 03h) [reset = 39h ]

REG03 is shown in 图 38 and described in 表 13.

Return to Summary Table.

### 图 38. REG03 Register

Bit	7	6	5	4 3 2 1 0				
Reset	0h	0h	1h			19h		
Field	FORCE_ICO	FORCE_INDET	EN_ICO			IINDPM[4:0]		

#### 表 13. REG03 Register Field Descriptions

Bit	Field	Туре	Reset by REG_RST	Reset by WATCHDOG	G Description		
7	FORCE_ICO	R/W	Yes	Yes	Force Start Input Current Optimizer (ICO): 0 – Do not force ICO (default) 1 – Force ICO start Note: This bit can only be set and always returns 0 after ICO starts. This bit valid when EN_ICO = 1.		
6	FORCE_INDET	R/W	Yes	Yes	S Force D+/D- Detection: 0 - Not in D+/D- detection (default) 1 - Force D+/D- detection		
5	EN_ICO	R/W	Yes	No	0 – Disable	nt Optimization (ICO) Algorithm Control: ICO ICO (default)	
4	IINDPM[4]	R/W	Yes	No	1600 mA	Input Current Limit:	
3	IINDPM[3]	R/W	Yes	No	800 mA Offset: 500 mA		
2	IINDPM[2]	R/W	Yes	No	400 mA Range: 500mA – 3300mA Default: 3000mA		
1	IINDPM[1]	R/W	Yes	No	200 mA Note: IINDPM > 3300 mA (1Ch) clamped to 3300mA. Act		
0	IINDPM[0]	R/W	Yes	No	100 mA	current limit is lower of I2C, ICO_ILIM,ILIM pin or D+/D	

### 8.5.5 Precharge and Termination Current Limit Register (Address = 04h) [reset = 22h]

REG04 is shown in 图 39 and described in 表 14.

Return to Summary Table.

#### 图 39. REG04 Register

Bit	7	6	5	4	3	2	1	0	
Reset		2	h		2h				
Field		IPRECH	HG[3:0]			ITERI	M[3:0]		

#### 表 14. REG04 Register Field Descriptions

Bit	Field	Туре	Reset by REG_RST	Reset by WATCHDOG	Description	n
7	IPRECHG[3]	R/W	Yes	Yes	400 mA	Precharge Current Limit:
6	IPRECHG[2]	R/W	Yes	Yes	200 mA	Offset: 50 mA
5	IPRECHG[1]	R/W	Yes	Yes	100 mA	Range: 50mA – 800mA Default: 150mA
4	IPRECHG[0]	R/W	Yes	Yes	50 mA	
3	ITERM[3]	R/W	Yes	Yes	400 mA	Termination Current Limit:
2	ITERM[2]	R/W	Yes	Yes	200 mA	Offset: 50 mA
1	ITERM[1]	R/W	Yes	Yes	100 mA	Range: 50mA – 800mA Default: 150mA
0	ITERM[0]	R/W	Yes	Yes	50 mA	

## 8.5.6 Charger Control 1 Register (Address = 05h) [reset = 9Dh]

REG05 is shown in 图 40 and described in 表 15.

Return to Summary Table.

### 图 40. REG05 Register

Bit	7	6	5	4	3	2	1	0
Reset	1h	0h	1h		1h	2	:h	1h
Field	EN_TERM	STAT_DIS	WATCHI	DOG[1:0]	EN_TIMER	CHG_TI	MER[1:0]	TMR2X_EN

#### 表 15. REG05 Register Field Descriptions

Bit	Field	Туре	Reset by REG_RST	Reset by WATCHDOG	Description
7	EN_TERM	R/W	Yes	Yes	Termination Control: 0 – Disable termination 1 – Enable termination (default)
6	STAT_DIS	R/W	Yes	Yes	STAT Pin Disable: 0 – Enable STAT pin function (default) 1 – Disable STAT pin function
5	WATCHDOG[1]	R/W	Yes	Yes	I2C Watchdog Timer Settings:
4	WATCHDOG[0]	R/W	Yes	Yes	00 – Disable WD Timer 01 – 40s (default) 10 – 80s 11 – 160s
3	EN_TIMER	R/W	Yes	Yes	Charging Safety Timer Enable 0 – Disable 1 – Enable (Default)
2	CHG_TIMER[1]	R/W	Yes	Yes	Fast Charge Timer Setting
1	CHG_TIMER[0]	R/W	Yes	Yes	00 – 5 hrs 01 – 8 hrs 10 – 12 hrs (Default) 11 – 20 hrs
0	TMR2X_EN	R/W	Yes	Yes	Safety Timer during DPM or TREG 0 – Safety timer always count normally 1 – Safety timer slowed by 2X during input DPM or TREG (Default)

### 8.5.7 Charger Control 2 Register (Address = 06h) [reset = 7Dh]

REG06 is shown in 图 41 and described in 表 16.

Return to Summary Table.

## 图 41. REG06 Register

Bit	7	6	5	5 4		2	1	0
Reset	0h	1h	31	h	1h	1h	0h

## 9 Application and Implementation

#### 注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 9.1 Application Information

A typical application consists of the BQ25883 configured as an I2C controlled power path management device and a 2s battery charger for Li-Ion and Li-polymer batteries used in a wide range of portable devices. It integrates an input blocking FET (QBLK, Q1), high-side switching FET (QHS, Q2), low-side switching FET (QLS, Q3), and battery FET (QBAT, Q4) between system and battery. The device also integrates a bootstrap diode for the high-side gate drive.

### 9.2 Typical Application

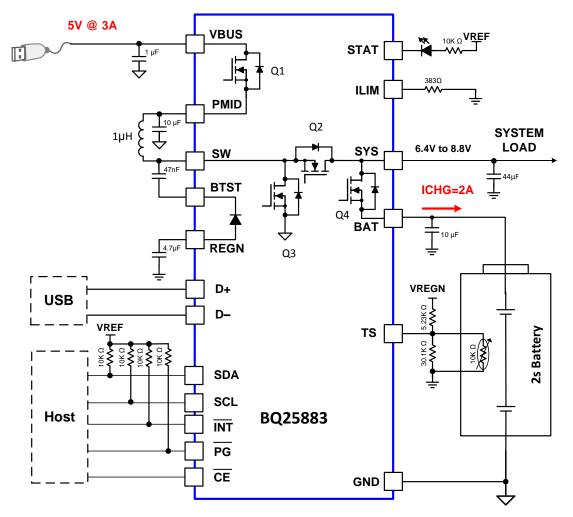

图 73. BQ25883 (I2C, OTG, and Power Path) Typical Application Diagram

#### Typical Application (接下页)

#### 9.2.1 Design Requirements

For this design example, use the parameters shown in the table below.

PARAMETER	VALUE
VBUS voltage range	3.9 V to 6.2 V
Input current limit (IINDPM[4:0])	2.4 A
Fast charge current limit (ICHG[5:0])	1.5 A
Minimum System Voltage (SYS_MIN[3:0])	6.2 V
Battery Regulation Voltage (VREG[7:0])	8.4 V

#### 表 48. Design Parameters

#### 9.2.2 Detailed Design Procedure

#### 9.2.2.1 Inductor Selection

The device has 1.5MHz switching frequency to allow the use of small inductor and capacitor values. The inductor saturation current should be higher than the input current ( $I_{IN}$ ) plus half the ripple current ( $I_{RIPPLE}$ ):

$$I_{SAT} \ge I_{IN} + \frac{I_{RIPPLE}}{2}$$
(5)

The inductor ripple current ( $I_{RIPPLE}$ ) depends on input voltage ( $V_{VBUS}$ ), duty cycle (D =  $V_{BAT}/V_{BUS}$ ), switching frequency ( $f_{SW}$ ) and inductance (L):

$$I_{RIPPLE} = \frac{V_{BUS} \times (V_{SYS} - V_{BUS})}{V_{SYS} \times f_{SW} \times L}$$
(6)

The maximum inductor ripple current happens in the vicinity of D = 0.5. Usually inductor ripple is designed in the range of (20 - 40%) maximum charging current as a trade-off between inductor size and efficiency for a practical design.

#### 9.2.2.2 Input (VBUS / PMID) Capacitor

Input capacitor should have enough ripple current rating to absorb input switching ripple current. The worst case RMS ripple current occurs when duty cycle is 0.5. If the converter does not operate at 50% duty cycle, then the worst case capacitor RMS current  $I_{PMID}$  occurs where the duty cycle is closest to 50% and can be estimated by

$$I_{PMID} = \frac{I_{RIPPLE}}{2 \times \sqrt{3}} \approx 0.29 \times I_{RIPPLE}$$
(7)

Low ESR ceramic capacitor such as X7R or X5R is preferred for input decoupling capacitor and should be placed close to the PMID and GND pins of the IC. Voltage rating of the capacitor must be higher than normal input voltage level. 25-V rating or higher capacitor is preferred for up to 5-V input voltage.  $10-\mu$ F capacitor is suggested for up to 3.3-A input current.

#### 9.2.2.3 Output (VSYS) Capacitor

SYS capacitor is the boost converter output capacitor and should also have enough ripple current rating to absorb output switching ripple current. The output capacitor RMS current  $I_{COUT}$  is given:

$$I_{CSYS, rms} = I_{OUT} \times \sqrt{\frac{D}{1 - D}}$$
(8)

The output capacitor voltage ripple is a function of the boost output current ( $I_{OUT}$ ), and can be calculated as follows:

$$\Delta V_{SYS} = \frac{I_{OUT} \times D}{f_{SW} \times C_{SYS}} \tag{9}$$

69

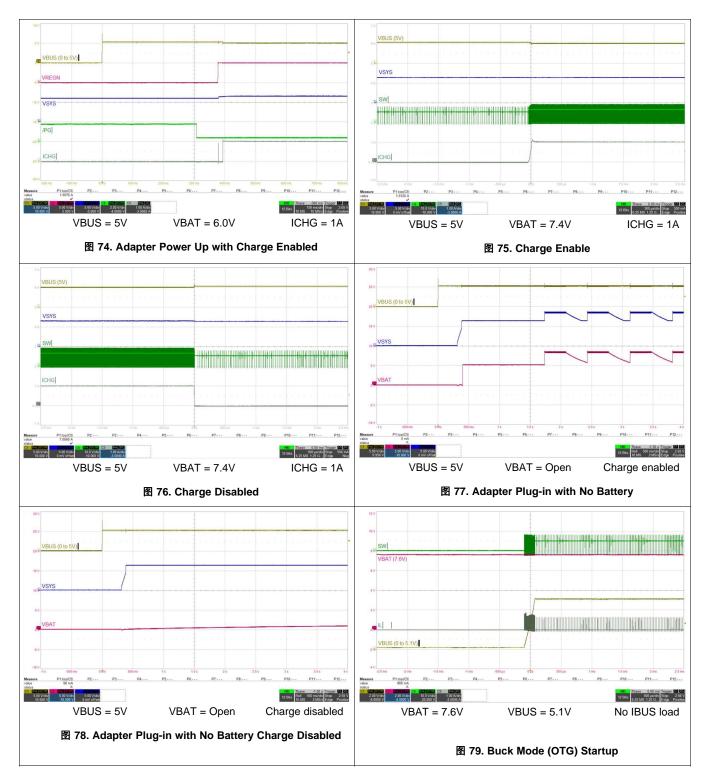

Low ESR ceramic capacitor such as X7R or X5R is preferred for SYS decoupling capacitor and should be placed close to theSYS and GND pins of the IC. Voltage rating of the capacitor must be higher than normal output voltage level. 16-V rating or higher capacitor is preferred. 44- $\mu$ F capacitor is suggested for up to 2.2-A boost converter output current.

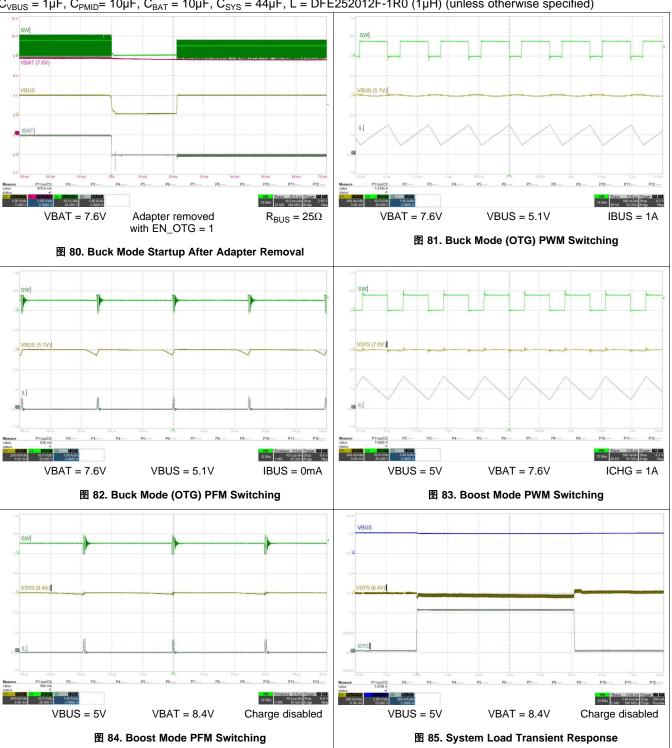

### 9.2.3 Application Curves

### 73

### **10 Power Supply Recommendations**

In order to provide an output voltage on SYS, the device requires a power supply between 3.9 V and 6.2 V input with at least 500-mA current rating connected to VBUS or a 2s Li-lon battery with voltage > VBAT\_UVLO connected to BAT The source current rating needs to be at least 3-A in order for the boost converter of the charger to provide maximum output power to SYS.

### 11 Layout

### 11.1 Layout Guidelines

The switching node rise and fall times should be minimized for minimum switching loss. Proper layout of the components to minimize high frequency current path loops is important to prevent electrical and magnetic field radiation and high frequency resonant problems. Here is a PCB layout priority list for proper layout. Layout PCB according to this specific order is essential.

- 1. Put SYS output capacitor as close to SYS and GND pins as possible. Ground connections need to be tied to the IC ground with a short copper trace connection or GND plane.
- 2. Place PMID input capacitor as close as possible to PMID pins and PGND pins and use shortest copper trace connection or GND plane.
- 3. Place inductor input terminal to SW pins as close as possible. Minimize the copper area of this trace to lower electrical and magnetic field radiation but make the trace wide enough to carry the input current. Minimize parasitic capacitance from this area to any other trace or plane.
- 4. Decoupling capacitors should be placed on the same side of and next to the IC and make trace connection as short as possible.
- 5. Route analog ground separately from power ground. Connect analog ground and connect power ground separately. Connect analog ground and power ground together using thermal pad as the single ground connection point. Or using a  $0-\Omega$  resistor to tie analog ground to power ground.
- 6. It is critical that the exposed thermal pad on the backside of the device package be soldered to the PCB ground. Ensure that there are sufficient thermal vias directly under the IC, connecting to the ground plane on the other layers.
- 7. Via size and number should be enough for a given current path.

Refer to the EVM design and the Layout Example below for the recommended component placement with trace and via locations.

E2E is a trademark of Texas Instruments. All other trademarks are the property of their respective owners.

#### 12.6 静电放电警告

ESD 可能会损坏该集成电路。德州仪器 (TI) 建议通过适当的预防措施处理所有集成电路。如果不遵守正确的处理措施和安装程序,可能会损坏集成电路。

ESD 的损坏小至导致微小的性能降级,大至整个器件故障。精密的集成电路可能更容易受到损坏,这是因为非常细微的参数更改都可能会导致器件与其发布的规格不相符。

### PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
BQ25883RGER	ACTIVE	VQFN	RGE	24	3000	RoHS & Green	NIPDAU	Level-1-260C-UNLIM	-40 to 85	BQ25883	Samples
BQ25883RGET	ACTIVE	VQFN	RGE	24	250	RoHS & Green	NIPDAU	Level-1-260C-UNLIM	-40 to 85	BQ25883	Samples

<sup>(1)</sup> The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

<sup>(2)</sup> RoHS: TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (CI) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

<sup>(3)</sup> MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

<sup>(4)</sup> There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

<sup>(5)</sup> Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

<sup>(6)</sup> Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
