

## DRV5011 低电压数字锁存器霍尔效应传感器

### 1 特性

- 超小型 X2SON、SOT-23、DSBGA 或 TO-92 封装
- 高磁性灵敏度:  $\pm 2\text{mT}$  (典型值)
- 可靠磁滞:  $4\text{mT}$  (典型值)
- 快速感应带宽:  $30\text{kHz}$
- $V_{CC}$  工作范围:  $2.5\text{V}$  至  $5.5\text{V}$
- 推挽式 CMOS 输出
  - 支持  $5\text{mA}$  拉电流和  $20\text{mA}$  灌电流
- 工作温度:  $-40^\circ\text{C}$  至  $+135^\circ\text{C}$

### 2 应用

- 无刷直流电机传感器
- 增量旋转编码:
  - 刷式直流电机反馈
  - 电机速度 (转速计)
  - 机械行程
  - 流体测量
  - 旋钮转动
  - 轮速
- 电动自行车
- 流量计

### 3 说明

DRV5011 器件是一款数字锁存器霍尔效应传感器, 专为电机和其他旋转系统而设计。

此器件具有工作电压范围为  $2.5\text{V}$  至  $5.5\text{V}$  的高效低电压架构, 采用标准 SOT-23 封装以及薄型 X2SON、DSBGA 和 TO-92 封装。输出端采用推挽驱动器, 无需使用上拉电阻器, 使系统更加紧凑小巧。

当南磁极靠近封装顶部并且超出  $B_{OP}$  阈值时, 该器件会驱动低电压。输出会保持低电平, 直到应用北极并且超出  $B_{RP}$  阈值, 这将使输出驱动高电压。必须交换北极和南极才能切换输出, 且集成的磁滞会分开  $B_{OP}$  和  $B_{RP}$  以提供可靠切换。

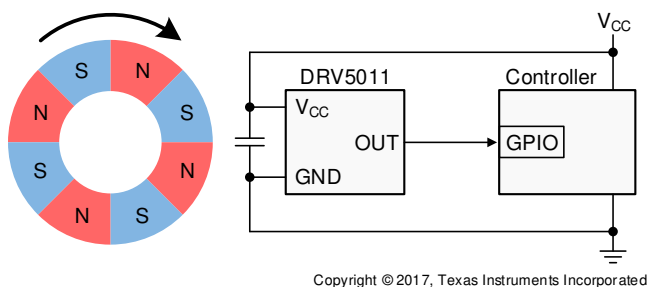

器件在  $-40^\circ\text{C}$  至  $+135^\circ\text{C}$  的宽环境温度范围内能够保持稳定一致的优异性能。

### 6.7 Typical Characteristics

## 7 Detailed Description

### 7.1 Overview

The DRV5011 is a magnetic sensor with a digital output that latches the most recent pole measured. Applying a south magnetic pole near the top of the package causes the output to drive low, whereas a north magnetic pole causes the output to drive high, and the absence of a magnetic field causes the output to continue to drive the previous state, whether low or high.

The device integrates a Hall effect element, analog signal conditioning, offset cancellation circuits, amplifiers, and comparators. This provides stable performance across a wide temperature range and resistance to mechanical stress.

### Feature Description (接下页)

The magnetic flux that travels from the bottom to the top of the package is considered positive in this data sheet. This condition exists when a south magnetic pole is near the top of the package. ## 8 Application and Implementation

### 注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 8.1 Application Information

The DRV5011 is typically used in rotary applications for brushless DC (BLDC) motor sensors or incremental rotary encoding.

For reliable functionality, the magnet must apply a flux density at the sensor greater than the maximum  $B_{OP}$  and less than the minimum  $B_{RP}$  thresholds. Add additional margin to account for mechanical tolerance, temperature effects, and magnet variation. Magnets generally produce weaker fields as temperature increases.

### 8.2 Typical Applications

#### 8.2.1 BLDC Motor Sensors Application

图 12. BLDC Motor System

#### 8.2.1.1 Design Requirements

For this design example, use the parameters listed in 表 1.

表 1. Design Parameters

DESIGN PARAMETER	EXAMPLE VALUE
Number of motor phases	3
Motor RPM	15 k
Number of magnet poles on the rotor	12
Magnetic material	Bonded Neodymium
Maximum temperature inside the motor	125°C
Magnetic flux density peaks at the Hall sensors at maximum temperature	±11 mT
Hall sensor $V_{CC}$	5 V ±10%

### 8.2.1.2 Detailed Design Procedure

Three-phase brushless DC motors often use three Hall effect latch devices to measure the electrical angle of the rotor and tell the controller how to drive the three wires. These wires connect to electromagnet windings, which generate magnetic fields that apply forces to the permanent magnets on the rotor.

Space the three Hall sensors across the printed-circuit board (PCB) so that they are 120 electrical degrees apart. This configuration creates six 3-bit states with equal time duration for each electrical cycle, which consists of one north and one south magnetic pole. From the center of the motor axis, the number of degrees to space each sensor equals  $2 / [\textit{number of poles}] \times 120^\circ$ . In this design example, the first sensor is placed at  $0^\circ$ , the second sensor is placed  $20^\circ$  rotated, and the third sensor is placed  $40^\circ$  rotated. Alternatively, a  $3\times$  degree offset can be added or subtracted to any sensor, meaning the third sensor could alternatively be placed at  $40^\circ - (3 \times 20^\circ) = -20^\circ$ .

图 14. Incremental Rotary Encoding System

### 8.2.2.1 Design Requirements

For this design example, use the parameters listed in 表 2.

表 2. Design Parameters

DESIGN PARAMETER	EXAMPLE VALUE
RPM range	0 to 45 k
Number of magnet poles	8
Magnetic material	Ferrite
Air gap above the Hall sensors	2.5 mm
Magnetic flux density peaks at the Hall sensors at maximum temperature	±7 mT

### 8.2.2.2 Detailed Design Procedure

Incremental encoders are used on knobs, wheels, motors, and flow meters to measure relative rotary movement. By attaching a ring magnet to the rotating component and placing a DRV5011 nearby, the sensor generates voltage pulses as the magnet turns. If directional information is also needed (clockwise versus counterclockwise), a second DRV5011 can be added with a phase offset, and then the order of transitions between the two signals describes the direction.

Creating this phase offset requires spacing the two sensors apart on the PCB, and an ideal 90° quadrature offset is attained when the sensors are separated by half the length of each magnet pole, plus any integer number of pole lengths. 图 14 shows this configuration, as the sensors are 1.5 pole lengths apart. One of the sensors changes its output every  $360^\circ / 8 \text{ poles} / 2 \text{ sensors} = 22.5^\circ$  of rotation. For reference, TI Design TIDA-00480, [Automotive Hall Sensor Rotary Encoder](#), uses a 66-pole magnet with changes every 2.7°.

The maximum rotational speed that can be measured is limited by the sensor bandwidth. Generally, the bandwidth must be faster than two times the number of poles per second. In this design example, the maximum speed is 45000 RPM, which involves 6000 poles per second. The DRV5011 sensing bandwidth is 30 kHz, which is five times the pole frequency. In systems where the sensor sampling rate is close to two times the number of poles per second, most of the samples measure a magnetic field that is significantly lower than the peak value, because the peaks only occur when the sensor and pole are perfectly aligned. In this case, add margin by applying a stronger magnetic field that has peaks significantly higher than the maximum  $B_{OP}$ .

### 8.2.2.3 Application Curve

Two signals in quadrature provide movement and direction information. [图 15](#) shows how each 2-bit state has unique adjacent 2-bit states for clockwise and counterclockwise.

**图 15. Quadrature Output (2-Bit)**

### 8.3 Dos and Don'ts

The Hall element is sensitive to magnetic fields that are perpendicular to the top of the package; therefore, the correct magnet orientation must be used for the sensor to detect the field. [图 16](#) shows correct and incorrect orientations when using a ring magnet.

**图 16. Correct and Incorrect Magnet Orientations**

## 9 Power Supply Recommendations

The DRV5011 is powered from 2.5-V to 5.5-V dc power supplies. A 0.01- $\mu$ F (minimum) ceramic capacitor rated for  $V_{CC}$  must be placed as close to the DRV5011 device as possible. Larger values of the bypass capacitor may be needed to attenuate any significant high-frequency ripple and noise components generated by the power source. TI recommends limiting the supply voltage variation to less than 50 mV<sub>PP</sub>.

## 10 Layout

### 10.1 Layout Guidelines

Magnetic fields pass through most nonferromagnetic materials with no significant disturbance. Embedding Hall effect sensors within plastic or aluminum enclosures and sensing magnets on the outside is common practice. Magnetic fields also easily pass through most PCBs, which makes placing the magnet on the opposite side possible.

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

<sup>(6)</sup> Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

# PACKAGE OUTLINE

DSBGA - 0.4 mm max height

DIE SIZE BALL GRID ARRAY

4224051/A 11/2017

NOTES:

- 1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
- 2. This drawing is subject to change without notice.

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. The package thermal pad must be soldered to the printed circuit board for thermal and mechanical performance.
4. Quantity and shape of side wall metal may vary.
