7.8 Typical Characteristics

8 Detailed Description

8.1 Overview

The DRV5053 device is a chopper-stabilized hall sensor with an analog output for magnetic sensing applications. The DRV5053 device can be powered with a supply voltage between 2.5 and 38 V, and will survive -22 V reverse battery conditions continuously. Note that the DRV5053 device will not be operating when approximately -22 to 2.4 V is applied to V_{CC} (with respect to GND). In addition, the device can withstand supply voltages up to 40 V for transient durations.

The output voltage is dependent on the magnetic field perpendicular to the package. The absence of a magnetic field will result in $OUT = 1$ V. A magnetic field will cause the output voltage to change linearly with the magnetic field.

The field polarity is defined as follows: a **south pole** near the marked side of the package is a positive magnetic field. A **north pole** near the marked side of the package is a negative magnetic field.

For devices with a negative sensitivity (that is, DRV5053RA: -40 mV/mT), a **south pole** will cause the output voltage to drop below 1 V, and a north pole will cause the output to rise above 1 V.

For devices with a positive sensitivity (that is, DRV5053EA: $+40$ mV/mT), a **south pole** will cause the output voltage to rise above 1 V, and a north pole will cause the output to drop below 1 V.

8.3 Feature Description

8.3.1 Field Direction Definition

A positive magnetic field is defined as a **south pole** near the marked side of the package as shown in [Figure 7](#).

Figure 7. Field Direction Definition

8.3.2 Device Output

The DRV5053 device output is defined below for negative sensitivity (that is, -45 mV/mT , RA) and positive sensitivity (that is, $+45 \text{ mV/mT}$, EA):

Figure 8. DRV5053 – Negative Sensitivity

Figure 9. DRV5053 – Positive Sensitivity

Feature Description (continued)
8.3.3 Power-On Time

After applying V_{CC} to the DRV5053 device, t_{on} must elapse before OUT is valid. Figure 10 shows Case 1 and Figure 11 shows case 2; the output is defined assuming a negative sensitivity device and a constant magnetic field $-B_{SAT} < B < B_{SAT}$.

Figure 10. Case 1: Power On When $B < 0$, North

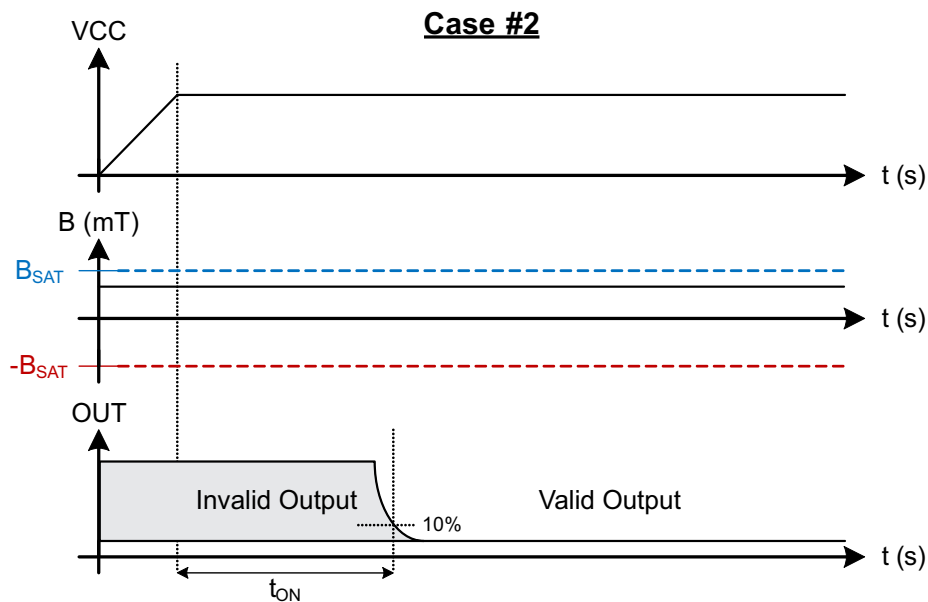

Figure 11. Case 2: Power On When $B > 0$, South

Feature Description (continued)

8.3.4 Output Stage

The DRV5053 output stage is capable of up to 300 μ A of current source or 2.3 mA sink.

For proper operation, ensure that equivalent output load $R_{OUT} > 10 \text{ k}\Omega$. In addition, ensure that the load capacitance $C_{OUT} < 10 \text{ nF}$.

8.3.5 Protection Circuits

An analog current limit circuit limits the current through the output driver. The driver current will be clamped to I_{OCP} .

8.3.5.1 Overcurrent Protection (OCP)

An analog current-limit circuit limits the current through the FET. The driver current is clamped to I_{OCP} . During this clamping, the $r_{DS(on)}$ of the output FET is increased from the nominal value.

8.3.5.2 Load Dump Protection

The DRV5053 device operates at DC V_{CC} conditions up to 38 V nominally, and can additionally withstand $V_{CC} = 40 \text{ V}$. No current-limiting series resistor is required for this protection.

8.3.5.3 Reverse Supply Protection

The DRV5053 device is protected in the event that the V_{CC} pin and the GND pin are reversed (up to -22 V).

NOTE

In a reverse supply condition, the OUT pin reverse-current must not exceed the ratings specified in the [Absolute Maximum Ratings](#).

Table 1.

FAULT	CONDITION	DEVICE	DESCRIPTION	RECOVERY
FET overload (OCP)	$I_{SINK} \geq I_{OCP}$	Operating	Output current is clamped to I_{OCP}	$I_O < I_{OCP}$
Load Dump	$38 \text{ V} < V_{CC} < 40 \text{ V}$	Operating	Device will operate for a transient duration	$V_{CC} \leq 38 \text{ V}$
Reverse Supply	$-22 \text{ V} < V_{CC} < 0 \text{ V}$	Disabled	Device will survive this condition	$V_{CC} \geq 2.5 \text{ V}$

8.4 Device Functional Modes

The DRV5053 device is active only when V_{CC} is between 2.5 and 38 V.

When a reverse supply condition exists, the device is inactive.

9 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application Information

The DRV5053 device is used in magnetic-field sensing applications.

9.2 Typical Applications

9.2.1 Typical Application With No Filter

Figure 12. Typical Application Schematic – No Filter

9.2.1.1 Design Requirements

For this design example, use the parameters listed in [Table 2](#) as the input parameters.

Table 2. Design Parameters

DESIGN PARAMETER	REFERENCE	EXAMPLE VALUE
System bandwidth	f_{BW}	15 kHz

9.2.1.2 Detailed Design Procedure

The DRV5053 has internal filtering that limits the bandwidth to at least 20 kHz. For this application no external components are required other than the C1 bypass capacitor, which is 0.01 μF minimum. If the analog output OUT is tied to a microcontroller ADC input, the equivalent load must be $R > 10 \text{ k}\Omega$ and $C < 10 \text{ nF}$.

Table 3. External Components

COMPONENT	PIN 1	PIN 2	RECOMMENDED
C1	V _{CC}	GND	A 0.01-μF (minimum) ceramic capacitor rated for V _{CC}

9.2.1.3 Application Curve

Figure 13. 10-kHz Switching Magnetic Field

9.2.2 Filtered Typical Application

For lower noise on the analog output OUT, additional RC filtering can be added to further reduce the bandwidth.

Figure 14. Filtered Typical Application Schematic

9.2.2.1 Design Requirements

For this design example, use the parameters listed in Table 4 as the input parameters.

Table 4. Design Parameters

DESIGN PARAMETER	REFERENCE	EXAMPLE VALUE
System bandwidth	f_{BW}	5 kHz

9.2.2.2 Detailed Design Procedure

In this example we will add an external RC filter in order to reduce the output bandwidth.

In order to preserve the signal at the frequencies of interest, we will conservatively select a low-pass filter bandwidth (–3-dB point) at twice the system bandwidth (10 kHz).

$$10 \text{ kHz} < \frac{1}{2\pi \times R_1 \times C_2} \tag{1}$$

If we guess $R_1 = 10 \text{ k}\Omega$, then $C_2 < 1590 \text{ pF}$. So we select $C_2 = 1500 \text{ pF}$.

9.2.2.3 Application Curves

10 Power Supply Recommendations

The DRV5053 device is designed to operate from an input voltage supply (VM) range between 2.5 and 38 V. A 0.01-µF (minimum) ceramic capacitor rated for V_{CC} must be placed as close to the DRV5053 device as possible.

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
