

LMH34400 具有集成钳位的 240MHz 单端跨阻放大器

1 特性

- 积分增益：40kΩ
- 性能， $C_{PD} = 1\text{pF}$ ：
 - 带宽：240MHz
 - 输入参考噪声：50nA_{RMS}
 - 上升、下降时间：1.5ns
- 集成式环境光消除
- 集成式 100mA 保护钳位
- 静态电流：20mA
- 低功耗模式电流：1.5mA
- 温度范围：-40°C 至 +125°C

2 应用

- [机械扫描激光雷达](#)
- [固态扫描激光雷达](#)
- [激光测距仪](#)
- [光学 ToF 位置传感器](#)
- [无人机视觉](#)
- [工业机器人激光雷达](#)
- [移动机器人激光雷达](#)
- [扫地机器人激光雷达](#)

3 说明

LMH34400 是业内超小型固定增益、单端跨阻放大器，适用于光探测和测距 (LIDAR) 应用和激光测距系统。LMH34400 可产生 1.0V_{PP} 的输出摆幅，并具有 50nA_{RMS} 的输入参考噪声。

LMH34400 具有集成的 100mA 电流钳位，可保护放大器，使器件在出现过载输入时能迅速恢复正常。LMH34400 还有一个集成式环境光消除 (ALC) 电路，可取代光电二极管与放大器之间的交流耦合，从而节省布板空间和系统成本。如果要测量的频率信号内容小于 400kHz，请禁用 ALC 环路。

当不使用放大器时，可以使用 $\overline{\text{EN}}$ 引脚将 LMH34400 置于低功耗模式，以节省能源。此功能允许将多个 LMH34400 放大器多路复用至接收信号链下一级的输入，同时 $\overline{\text{EN}}$ 控制引脚提供多路复用器选择功能。LMH34400 提供单端输出并经过优化，可与基于时数转换器 (TDC) 的 LIDAR 系统一同使用。

封装信息

器件型号	封装 ⁽¹⁾	封装尺寸 ⁽²⁾
LMH34400	DRL (SOT5X3, 6)	1.6mm × 1.6mm

(1) 有关详细信息，请参阅节 10。

(2) 封装尺寸 (长 × 宽) 为标称值，并包括引脚 (如适用)。

4 Pin Configuration and Functions

**图 4-1. DRL Package,
6-Pin SOT5X3
(Top View)**

表 4-1. Pin Functions

PIN		TYPE ⁽¹⁾	DESCRIPTION
NAME	NO.		
EN	3	I	Device enable pin. $\overline{\text{EN}}$ = logic low = normal operation (default) ⁽²⁾ ; $\overline{\text{EN}}$ = logic high = low-power mode.
GND	5	I	Amplifier ground
IDC_EN	6	I	Ambient light cancellation loop enable. IDC_EN = logic low = enable dc cancellation (default) ⁽²⁾ ; IDC_EN = logic high = disable dc cancellation.
IN	1	I	Transimpedance amplifier input
OUT	4	O	Amplifier output
VDD	2	I	Positive power supply

(1) I = input, O = output

(2) TI recommends driving a digital pin with a low-impedance source rather than leaving the pin floating because fast-moving transients can couple into the pin and inadvertently change the logic level.

5 Specifications

5.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

		MIN	MAX	UNIT
V _{DD}	Total supply voltage		3.65	V
	Voltage at output pin	0	V _{DD}	V
	Voltage at logic pins	- 0.25	V _{DD}	V
I _{IN}	Continuous current into IN		25	mA
I _{OUT}	Continuous output current		35	mA
T _J	Junction temperature		150	°C
T _A	Operating free-air temperature	- 40	125	°C
T _{stg}	Storage temperature	- 65	150	°C

- (1) Operation outside the *Absolute Maximum Ratings* may cause permanent device damage. *Absolute Maximum Ratings* do not imply functional operation of the device at these or any other conditions beyond those listed under *Recommended Operating Conditions*. If used outside the *Recommended Operating Conditions* but within the *Absolute Maximum Ratings*, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.

5.2 ESD Ratings

			VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/ JEDEC JS-001, all pins ⁽¹⁾	±1000	V
		Charged device model (CDM), per ANSI/ESDA/ JEDEC JS-002, all pins ⁽²⁾	±250	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
 (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

5.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
V _{DD}	Total supply voltage	3	3.3	3.45	V
T _A	Operating free-air temperature	- 40		125	°C

5.4 Thermal Information

THERMAL METRIC ⁽¹⁾		LMH34400	UNIT
		DRL (SOT-563)	
		6 PINS	
R _{θJA}	Junction-to-ambient thermal resistance	201.2	°C/W
R _{θJC(top)}	Junction-to-case (top) thermal resistance	101.5	°C/W
R _{θJB}	Junction-to-board thermal resistance	83.2	°C/W
Ψ _{JT}	Junction-to-top characterization parameter	5.4	°C/W
Ψ _{JB}	Junction-to-board characterization parameter	82.4	°C/W
R _{θJC(bot)}	Junction-to-case (bottom) thermal resistance	N/A	°C/W

- (1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

5.5 Electrical Characteristics

at $V_{DD} = 3.3\text{ V}$, $C_{PD}^{(1)} = 1\text{ pF}$, $\overline{EN} = 0\text{ V}$, $\overline{IDC_EN} = 3.3\text{ V}$, $R_L = 100\ \Omega$ (Output is AC-coupled for AC performance parameters; for DC performance parameters load is referenced to 1V), and $T_A = 25^\circ\text{C}$ (unless otherwise noted)

6 Detailed Description

6.1 Overview

The LMH34400 is a single-channel, single-ended output, high-speed transimpedance amplifier (TIA) and features several integrated functions geared towards light detection and ranging (LIDAR) and pulsed time-of-flight (ToF) systems. The LMH34400 is designed to work with photodiode (PD) anodes that are biased to a negative voltage and cathodes that are tied to the amplifier input; therefore, the amplifier sources the photocurrent. The LMH34400 is offered in a space-saving 1.6-mm × 1.6-mm, 6-pin SOT5X3 package and is rated over a temperature range from -40°C to +125°C.

6.2 Functional Block Diagram

6.3 Feature Description

6.3.1 Clamping and Input Protection

The LMH34400 is designed to work with photodiode (PD) configurations that can source or sink current; the LMH34400, however, is optimized for a sinking current configuration. It is assumed that the LMH34400 device is being used with a PD that is configured with its cathode tied to the amplifier input and the anode tied to a negative supply voltage, unless stated otherwise.

The LMH34400 features two internal clamps, a fast recovery clamp and a soft clamp. The fast recovery clamp is the active clamp when the photodiode is sinking a photocurrent. The soft clamp is the active clamp when the photodiode is sourcing a photocurrent.

Stray reflections from nearby objects with high reflectivity can produce large output current pulses from the PD. The linear input range of the LMH34400 is approximately 30 μA . Input currents in excess of the linear current range cause the internal nodes of the amplifier to saturate, which increases the amplifier recovery time. The end result is a broadening of the output pulse leading to blind zones in the system. To protect against this condition, the LMH34400 features an integrated clamp that absorbs and diverts the excess current to the positive supply (V_{DD}) when the amplifier detects its nodes entering a saturated condition. The integrated clamp minimizes the pulse extension to less than a few nanoseconds for input pulses up to 100 mA. When the amplifier is in low-power mode, the clamp circuitry is still active, thereby protecting the TIA input.

6.3.2 ESD Protection

All LMH34400 IO pins excluding (V_{DD} and GND) have an internal electrostatic discharge (ESD) protection diode to the positive and negative supply rails to protect the amplifier from ESD events.

6.3.3 Single-Ended Output Stage

The output stage of the LMH34400 has a 10- Ω series resistor on its output to isolate the amplifier output stage transistors from the package bond-wire inductance and printed circuit board (PCB) capacitance. The net gain of the LMH34400 (TIA + output stage) is 40 k Ω when driving an external 100- Ω resistor. When the external load resistor is increased above 100 Ω , the effective gain from the IN pin to the output pin increases. Consequently, when the external load resistor is decreased to less than 100 Ω , the effective gain from the IN pin to the output pin decreases as a result of the larger voltage drop across the internal 10- Ω resistor. When there is no load resistor connected to the output pin, the effective TIA gain is 44 k Ω . The output voltage of the LMH34400 is set to a fixed value of 1.0 V when there is no current flowing into the amplifier. The output swings above and below 1.0 V when the photodiode sinks and sources current, respectively.

6.4 Device Functional Modes

6.4.1 Ambient Light Cancellation Mode

The LMH34400 has an integrated DC cancellation loop that can be used to cancel any voltage offsets resulting from ambient light. The DC cancellation loop is enabled by setting IDC_EN low. Incident ambient light on a photodiode produces a DC current resulting in an offset voltage at the output of the TIA stage. If the photodiode produces a DC output current resulting from ambient light, then the output of the level-shift buffer stage is offset from the reference voltage V_{REF} . The ALC loop detects this offset and produces an opposing DC current to compensate for the differential offset voltage at its input. The loop has a high-pass cutoff frequency of 400 kHz. The ambient light cancellation loop is disabled when the amplifier is placed in low-power mode.

The shot noise current introduced by the DC cancellation loop increases the overall amplifier noise. So, if the ambient light level is negligible, then disable the loop to improve SNR. The cancellation loop helps save PCB space and system costs by eliminating the need for external AC coupling passive components. Additionally, the extra trace inductance and PCB capacitance introduced by using external AC coupling components degrades the LMH34400 dynamic performance.

6.4.2 Power-Down Mode (Multiplexer Mode)

The LMH34400 can be placed in low-power mode by setting $\overline{\text{EN}}$ high, which helps in saving system power. Enabling low-power mode puts the outputs of the internal amplifiers in the LMH34400 in a high-impedance state.

图 6-1 shows how this device feature can further save board space and cost by eliminating the need for a discrete high-speed multiplexer, if a system consists of several photodiode and amplifier channels multiplexed to single time-of-flight detector circuit. The disabled channel outputs are not an ideal open circuit; therefore, as the number of multiplexed channels increases, the disabled channels begin to load the enabled channel. An additional isolation resistor helps to reduce the impact of reflections from disabled channels. Multiplexing more than four channels in parallel degrades the performance of the enabled channel.

When the amplifier is in low-power mode, the clamp circuitry is still active thereby protecting the TIA input. The ambient light cancellation loop is disabled when the amplifier is placed in power-down mode. When the LMH34400 device is brought out of power-down operation, the ambient light cancellation loop requires several time constants to settle. The time constant is based on the 400-kHz cutoff frequency of the loop.

图 6-1. Configuring Two LMH34400 Devices in Multiplexer Mode

7 Application and Implementation

备注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

7.1 Application Information

The high gain and single-ended output of the LMH34400 is designed to be used in connection with a time-to-digital converter (TDC) for a time-of-flight (ToF) based receiver in a LIDAR system. The TDC function can be implemented using a stand-alone TDC or using a FPGA. ToF receive circuits that use TDC are significantly less expensive and consume considerably less power when compared to an analog-to-digital converter (ADC) based solution. The output of the LMH34400 presents an analog representation of the returned light pulse. Common practice uses a time-discriminator circuit before the TDC to precisely use a deterministic portion of the returned waveform to stop the TDC. The most straightforward method to accomplish this action is called leading-edge discrimination. This method uses a high-speed comparator with a low propagation delay to stop the TDC when the waveform crosses a chosen incoming light amplitude value.

In many applications, the amplitude of the returned pulse can vary considerably as a result of the difference in target reflectivity or simply the light source spreading out to a target moving to longer distances. For this reason, choose a comparator with low dispersion. If the dispersion is high, then the amplitude variation in the returned signal is converted to a variation in the timing signal presented to the TDC. This behavior is known as a *walk error*. 图 7-1 shows the LMH34400 connected to the TLV3601 high-speed comparator. In this configuration, an incoming optical pulse sources current out of the amplifier input pin and delivers a proportional voltage pulse to the comparator input. The amplifier output has 1.0-V dc with no input current; therefore, set the reference voltage of the comparator to a level greater than 1.0 V. For example, to have the comparator change states when the input is greater than 10 μA , then set the V_{REF} voltage to $1.0\text{ V} + (40\text{ k}\Omega \times 10\text{ }\mu\text{A}) = 1.4\text{ V}$.

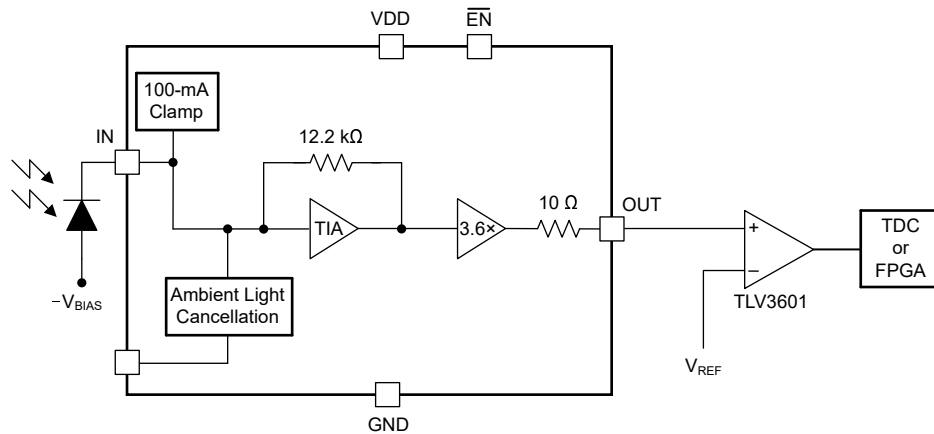

图 7-1. LMH34400 to Interface to Comparator and TDC

7.2 Typical Applications

7.2.1 LMH34400 Test Circuit

图 7-2 shows the circuit used to test the LMH34400 with a voltage source.

图 7-2. LMH34400 Test Circuit

7.2.1.1 Design Requirements

The objective is to design a low-noise, wideband output transimpedance amplifier. The design requirements are as follows:

- Amplifier supply voltage: 3.3 V
- Transimpedance gain: 40 k Ω
- Photodiode capacitance: $C_{PD} = 1$ pF
- Target bandwidth: 240 MHz
- Integrated input-referred noise: 50 nA_{RMS} (noise bandwidth = 250 MHz)

7.2.1.2 Detailed Design Procedure

图 7-2 shows the LMH34400 test circuit used to evaluate various bandwidth without using an optical input signal. The voltage source is dc biased close to the input bias voltage of the LMH34400 (approximately 2.5 V). The LMH34400 internal design is optimized to only source current out of the input pin (pin 1). When testing the LMH34400 with a network analyzer or other ac source, control the dc bias such that the sum of the input ac and dc components does not result in a sourcing current into the amplifier input.

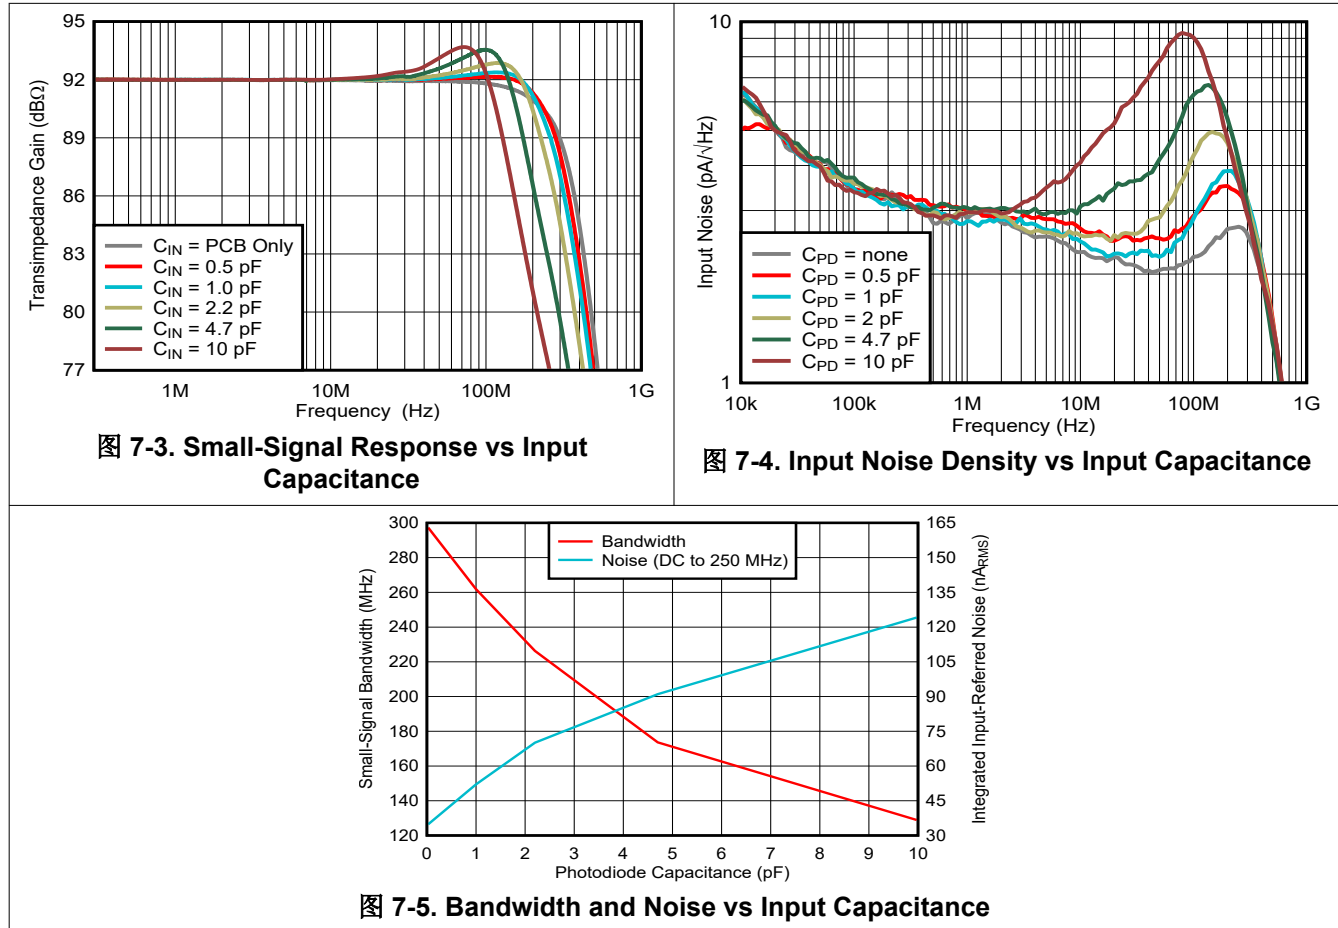

In the configuration shown in 图 7-2, there is a 50- Ω series resistor that helps with any reflection into the observing instrument. The instrument can be any 50- Ω impedance input device such as a vector network analyzer (VNA) or oscilloscope. This setup creates a voltage divider on the output and reduces the TIA amplitude by a factor of two. Make sure to consider this factor when interpreting the measured results.

The bandwidth of a transimpedance amplifier strongly depends on the capacitance of the photodiode (C_{PD}) that is connected to the input pin of the amplifier. The larger the capacitance, the lower the closed-loop bandwidth. 图 7-3 shows when the C_{PD} that is connected to the LMH34400 is between 0 pF and 10 pF.

While bandwidth is inversely proportional to the photodiode capacitance, the input-referred current noise and photodiode capacitance are directly proportional. To measure the output noise, use the same circuit in 图 7-2 with a simple modification. In this case, remove all components on the input pin except C_{PD} . 图 7-4 shows the impact of the input-referred noise density as the C_{PD} is varied from 0 pF to 10 pF. As the capacitance increases, the amplitude and breadth of the high-frequency noise increases significantly.

图 7-5 shows the impact of an increasing photodiode capacitance on these two parameters in one plot. In this plot, the integrated input-referred noise is calculated over a fixed range of dc to 250 MHz. Both the small-signal bandwidth and integrated input-referred noise trend toward poorer performance as the capacitance increases. For the highest level of performance, minimize the photodiode capacitance. As the photodiode capacitance is proportional to the photodiode light-capturing area, the final value chosen is a compromise of several system variables and differs between applications.

7.2.1.3 Application Curves

7.2.2 LMH34400 Signal Chain With Comparator

A common application for the LMH34400 is as a transimpedance front-end driving a comparator that can connect to a time-to-digital converter to calculate distances from pulse-based time-of-flight (ToF) measurements. 图 7-6 shows the test circuit using a commercially available photodiode with 1 pF of pin capacitance and a 2-GHz cutoff frequency. Select a photodiode with a cutoff frequency far greater than the LMH34400 bandwidth. The photodiode is connected to the LMH34400, which then drives the TLV3601 comparator. Choose a comparator with low input overdrive dispersion to reduce walk error.

图 7-6. LMH34400 Signal Chain With Comparator

7.2.2.1 Design Requirements

The objective is to design a transimpedance front-end that can receive a 10 ns wide pulse, amplify the pulse through the LMH34400, and then drive the output through a comparator. The design requirements are as follows:

- Supply voltage 3.3 V
- Photodiode capacitance 1 pF
- Pulse width 10 ns
- Input current pulse edge rate 1 ns
- Input peak current 25 μ A

7.2.2.2 Detailed Design Procedure

The circuit in 图 7-6 shows a photodiode anode connected to the LMH34400 that is followed by a comparator. To create the 10-ns, 25- μ A input-current pulses, choose a photodiode with low input capacitance and minimal biasing requirements that allows for easy optical coupling through fiber. Given the 40-k Ω gain from the LMH34400, the expected output voltage with a 25- μ A input current is a 1-V peak signal. With input-pulse edge rates of 1 ns, the LMH34400 is expected to produce slower pulse edges because the input slew rate is higher than the capabilities of the device. To increase the edge rates of the LMH34400 output signal, the TLV3601 comparator is added after the LMH34400 because the TLV3601 has a rise and fall time of 750 ps.

For a simple time-of-flight application, the output of the comparator can be connected to a time-to-digital converter (TDC) to perform a simple distance calculation. Using this method, the distance is calculated by measuring the time between outgoing and incoming pulse edges and multiplying by two. In the signal chain, the LMH34400 provides the initial signal amplification and conversion to a voltage. Then, the TLV3601 further increases the output amplitude, as well as provides a clean, fast edge to a following time-to-digital converter.

In the circuit design, the interface between the LMH34400 and the TLV3601 does not require any additional biasing or level shifting, because the LMH34400 default output bias interfaces easily with the comparator. Additionally, this 1-V bias level allows for setting the threshold voltage to half of the supply voltage, which keeps the threshold voltage as close as possible to the center of the comparator bias range. However, this threshold can be set at any value greater than 1 V to adjust for the dynamic-range requirements of the application. In this realization, the output of the TLV3601 is connected to a 50- Ω series output resistance to properly interface with 50- Ω terminated test equipment.

7.2.2.3 Application Curves

图 7-7 through 图 7-9 show the control signal input, LMH34400 output, and TLV3601 output, respectively, with a 10-ns wide, 1-ns edge rate input current pulse. The figures show the ability of the LMH34400 to convert a small 25- μ A input signal to a 1-V output, and then use the TLV3601 to increase the edge rate and amplitude of the received pulse. Also, the shape of this output pulse stays approximately constant over a large range of optical input power levels. In this specific case, be aware that the output swing of the TLV3601 is limited because the TLV3601 is driving a matched 100- Ω load to interface with the test equipment.

图 7-8. LMH34400 Output Voltage

图 7-9. TLV3601 Output Voltage Driving 100- Ω Load

7.3 Power Supply Recommendations

The LMH34400 operates on a single 3.3-V power supply. A low power-supply source impedance must be maintained across frequency; therefore, use multiple bypass capacitors in parallel. Place the bypass capacitors as close as possible to the supply pin, and place the smallest capacitor on the same side of the PCB as the LMH34400. Preferably, also place the larger-valued bypass capacitors on the same side of the PCB. However, the capacitors can be positioned on the opposite side of the PCB using multiple vias if layout space is overly constrained.

7.4 Layout

7.4.1 Layout Guidelines

Achieving desired performance with a high-frequency amplifier such as the LMH34400 requires careful attention to board layout parasitics and external component types. Recommendations that optimize performance include:

- **Minimize parasitic capacitance from the signal I/O pins to ac ground.** Parasitic capacitance on the output pins can cause instability whereas parasitic capacitance on the input pin reduces the amplifier bandwidth. To reduce unwanted capacitance, cut out the power and ground traces under the signal input and output pins. Otherwise, ground and power planes must be unbroken elsewhere on the board.
- **Minimize the distance from the power-supply pins to high-frequency bypass capacitors.** Use high quality, 100-pF to 0.1- μ F, C0G and NPO-type decoupling capacitors with voltage ratings at least three times greater than the amplifiers maximum power supplies. Place the smallest-value capacitors on the same side as the DUT. If possible, use low equivalent series impedance capacitors to further reduce the parasitic impedance. If space constraints force the larger value bypass capacitors to be placed on the opposite side of the PCB, then use multiple vias on the supply and ground side of the capacitors. This configuration provides is a low-impedance path to the amplifiers power-supply pins across the amplifiers gain bandwidth specification. Avoid narrow power and ground traces to minimize inductance between the pins and the decoupling capacitors. Use larger (2.2- μ F to 6.8- μ F) decoupling capacitors that are effective at lower frequency on the supply pins. Place these decoupling capacitors further from the device.

8.6 静电放电警告

静电放电 (ESD) 会损坏这个集成电路。德州仪器 (TI) 建议通过适当的预防措施处理所有集成电路。如果不遵守正确的处理和安装程序，可能会损坏集成电路。

ESD 的损坏小至导致微小的性能降级，大至整个器件故障。精密的集成电路可能更容易受到损坏，这是因为非常细微的参数更改都可能会导致器件与其发布的规格不相符。

10 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
LMH34400IDRLR	ACTIVE	SOT-5X3	DRL	6	4000	RoHS & Green	NIPDAUAG	Level-2-260C-1 YEAR	-40 to 125	1M5	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSELETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
