

LMZ23603 3-A SIMPLE SWITCHER® Power Module With 36-V Maximum Input Voltage

1 Features

- Integrated Shielded Inductor
- Simple PCB Layout
- Frequency Synchronization Input (650 kHz to 950 kHz)
- Flexible Startup Sequencing Using External Soft-start, Tracking and Precision Enable
- Protection Against Inrush Currents and Faults Such as Input UVLO and Output Short Circuit
- Junction Temperature Range -40°C to 125°C
- Single Exposed Pad and Standard Pinout for Easy Mounting and Manufacturing
- Fast Transient Response for Powering FPGAs and ASICs
- Fully Enabled for WEBENCH® Power Designer
- Pin Compatible With LMZ22005/LMZ23605/LMZ22003
- Performance Benefits
 - High Efficiency Reduces System Heat Generation
 - Tested to EN55022 Class B
 - See AN-2125 (SNVA473) and layout for information on device under test.
 - $V_{\text{IN}} = 24\text{ V}$, $V_{\text{O}} = 3.3\text{ V}$, $I_{\text{O}} = 3\text{ A}$

NOTE: EN 55022:2006, +A1:2007, FCC Part 15 Subpart B: 2007.

- Low component count, only 5 external components
- Low output voltage ripple
- Uses PCB as heat sink, no airflow required
- Electrical Specifications
 - 18-W maximum total output power
 - Up to 3-A output current
 - Input voltage range 6 V to 36 V
 - Output voltage range 0.8 V to 6 V
 - Efficiency up to 92%

2 Applications

- Point-of-load Conversions from 12-V and 24-V Input Rail
- Time-Critical Projects
- Space Constrained and High Thermal Requirement Applications
- Negative Output Voltage Applications (See AN-2027, SNVA425)

3 Description

The LMZ23603 SIMPLE SWITCHER® power module is an easy-to-use step-down DC-DC solution capable of driving up to 3-A load. The LMZ23603 is available in an innovative package that enhances thermal performance and allows for hand or machine soldering.

The LMZ23603 can accept an input voltage rail between 6 V and 36 V and deliver an adjustable and highly accurate output voltage as low as 0.8 V. The LMZ23603 only requires two external resistors and three external capacitors to complete the power solution. The LMZ23603 is a reliable and robust design with the following protection features: thermal shutdown, programmable input undervoltage lockout, output overvoltage protection, short circuit protection, output current limit, and allows start-up into a prebiased output. The sync input allows synchronization over the 650-kHz to 950-kHz switching frequency range.

Device Information⁽¹⁾⁽²⁾

PART NUMBER	PACKAGE	BODY SIZE (NOM)
LMZ23603	NDW (7)	10.16 mm x 9.85 mm

(1) For all available packages, see the orderable addendum at the end of the data sheet.

(2) Peak reflow temperature equals 245°C . See SNAA214 for more details.

4 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision I (October 2013) to Revision J	Page
<ul style="list-style-type: none"> • Added <i>Pin Configuration and Functions</i> section, <i>ESD Ratings</i> table, <i>Feature Description</i> section, <i>Device Functional Modes</i>, <i>Application and Implementation</i> section, <i>Power Supply Recommendations</i> section, <i>Layout</i> section, <i>Device and Documentation Support</i> section, and <i>Mechanical, Packaging, and Orderable Information</i> section 1 • Deleted Easy-to-Use PFM 7-Pin Package image 1 	

Changes from Revision H (April 2013) to Revision I	Page
<ul style="list-style-type: none"> • Deleted 12 mil 4 • Changed 10 mil 23 • Changed 10 mil 26 • Added <i>Power Module SMT Guidelines</i> 26 	

5 Pin Configuration and Functions

Pin Functions

PIN		TYPE	DESCRIPTION
NAME	NO.		
AGND	4	Ground	Analog Ground — Reference point for all stated voltages. Must be externally connected to EP/PGND.
EN	3	Analog	Enable — Input to the precision enable comparator. Rising threshold is 1.279 V typical. Once the module is enabled, a 21- μ A source current is internally activated to facilitate programmable hysteresis.
EP/PGND	—	Ground	Exposed Pad / Power Ground Electrical path for the power circuits within the module. — NOT Internally connected to AGND / pin 4. Used to dissipate heat from the package during operation. Must be electrically connected to pin 4 external to the package.
FB	5	Analog	Feedback — Internally connected to the regulation, overvoltage, and short circuit comparators. The regulation reference point is 0.796 V at this input pin. Connect the feedback resistor divider between the output and AGND to set the output voltage.
SS/TRK	6	Analog	Soft-Start/Track — To extend the 1.6-ms internal soft-start connect an external soft-start capacitor. For tracking connect to an external resistive divider connected to a higher priority supply rail. See Design Steps for the LMZ23603 Application section.
SYNC	2	Analog	Sync Input — Apply a CMOS logic level square wave whose frequency is between 650 kHz and 950 kHz to synchronize the PWM operating frequency to an external frequency source. When not using synchronization connect to ground. The module free running PWM frequency is 812 kHz (typical).
VIN	1	Power	Supply input — Nominal operating range is 6 V to 36 V. A small amount of internal capacitance is contained within the package assembly. Additional external input capacitance is required between this pin and exposed pad (PGND).
VOUT	7	Power	Output Voltage — Output from the internal inductor. Connect the output capacitor between this pin and exposed pad.

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾⁽²⁾⁽³⁾

	MIN	MAX	UNIT
VIN to PGND	-0.3	40	V
EN, SYNC to AGND	-0.3	5.5	V
SS/TRK, FBto AGND	-0.3	2.5	V
AGND to PGND	-0.3	0.3	V
Junction Temperature		150	°C
Peak Reflow Case Temperature (30 sec)		245	°C
Storage temperature, T _{stg}	-65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) If Military/Aerospace specified devices are required, please contact the Texas Instruments Sales Office/Distributors for availability and specifications.
- (3) For soldering specifications: see product folder at www.ti.com and SNOA549

6.2 ESD Ratings

		VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾⁽²⁾	±2000 V

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

(2) The human body model is a 100pF capacitor discharged through a 1.5 kΩ resistor into each pin. Test method is per JESD-22-114.

6.3 Recommended Operating Conditions

	MIN	MAX	UNIT
V_{IN}	6	36	V
EN, SYNC	0	5	V
Operation Junction Temperature	-40	125	°C

6.4 Thermal Information

THERMAL METRIC ⁽¹⁾			LMZ23603		UNIT
			NDW		
			7 PINS		
$R_{\theta JA}$	Junction-to-ambient thermal resistance ⁽²⁾	4-layer Evaluation Printed-Circuit-Board, 60 vias, No air flow	12.0		°C/W
		2-layer JEDEC Printed-Circuit-Board, No air flow	21.5		
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	No air flow	1.9		°C/W

(1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report, [SPRA953](#).

(2) $R_{\theta JA}$ measured on a 3.5-in × 3.5-in 4-layer board, with 3-oz. copper on outer layers and 2-oz. copper on inner layers, sixty thermal vias, no air flow, and 1-W power dissipation. Refer to PCB layout diagrams.

6.5 Electrical Characteristics

Limits are for $T_J = 25^\circ\text{C}$ unless otherwise specified. Minimum and Maximum limits are specified through test, design or statistical correlation. Typical values represent the most likely parametric norm at $T_J = 25^\circ\text{C}$, and are provided for reference purposes only. Unless otherwise stated the following conditions apply: $V_{IN} = 12\text{V}$, $V_{OUT} = 3.3\text{V}$

PARAMETER	TEST CONDITIONS		MIN ⁽¹⁾	TYP ⁽²⁾	MAX ⁽¹⁾	UNIT	
SYSTEM PARAMETERS							
ENABLE CONTROL							
V_{EN}	EN threshold trip point	V_{EN} rising	1.279		V		
			over the junction temperature (T_J) range of -40°C to $+125^\circ\text{C}$	1.1			1.458
V_{EN-HYS}	EN input hysteresis current	$V_{EN} > 1.279\text{ V}$	-21			μA	
SOFT-START							
I_{SS}	SS source current	$V_{SS} = 0\text{ V}$	50		μA		
			over the junction temperature (T_J) range of -40°C to $+125^\circ\text{C}$	40			60
t_{SS}	Internal soft-start interval		1.6			ms	
CURRENT LIMIT							
I_{CL}	Current limit threshold	DC average	over the junction temperature (T_J) range of -40°C to $+125^\circ\text{C}$	3.4		A	
INTERNAL SWITCHING OSCILLATOR							
f_{osc}	Free-running oscillator frequency	Sync input connected to ground.		711	812	914	kHz
f_{sync}	Synchronization range			650	950		kHz

(1) Min and Max limits are 100% production tested at 25°C . Limits over the operating temperature range are specified through correlation using Statistical Quality Control (SQC) methods. Limits are used to calculate TI's Average Outgoing Quality Level (AOQL).

(2) Typical numbers are at 25°C and represent the most likely parametric norm.

Electrical Characteristics (continued)

Limits are for $T_J = 25^\circ\text{C}$ unless otherwise specified. Minimum and Maximum limits are specified through test, design or statistical correlation. Typical values represent the most likely parametric norm at $T_J = 25^\circ\text{C}$, and are provided for reference purposes only. Unless otherwise stated the following conditions apply: $V_{IN} = 12\text{V}$, $V_{OUT} = 3.3\text{V}$

PARAMETER		TEST CONDITIONS		MIN ⁽¹⁾	TYP ⁽²⁾	MAX ⁽¹⁾	UNIT
$V_{IL\text{-sync}}$	Synchronization logic zero amplitude	Relative to AGND	over the junction temperature (T_J) range of -40°C to $+125^\circ\text{C}$			0.4	V
$V_{IH\text{-sync}}$	Synchronization logic one amplitude	Relative to AGND.	over the junction temperature (T_J) range of -40°C to $+125^\circ\text{C}$	1.5			V
$V_{\text{sync DC}}$	Synchronization duty cycle range			15%	50%	85%	
D_{max}	Maximum Duty Factor				83%		
REGULATION AND OVERVOLTAGE COMPARATOR							
V_{FB}	In-regulation feedback voltage	$V_{SS} >+ 0.8\text{ V}$ $T_J = -40^\circ\text{C}$ to 125°C $I_O = 3\text{ A}$			0.796		V
				over the junction temperature (T_J) range of -40°C to $+125^\circ\text{C}$	0.776	0.816	
$V_{FB\text{-OV}}$	Feedback overvoltage protection threshold				0.86		V
I_{FB}	Feedback input bias current				5		nA
I_Q	Non-switching input current	$V_{FB} = 0.86\text{ V}$			2.6		mA
I_{SD}	Shutdown quiescent current	$V_{EN} = 0\text{ V}$			70		μA
THERMAL CHARACTERISTICS							
T_{SD}	Thermal shutdown	Rising			165		$^\circ\text{C}$
$T_{SD\text{-HYST}}$	Thermal shutdown hysteresis	Falling			15		$^\circ\text{C}$
PERFORMANCE PARAMETERS⁽³⁾							
ΔV_O	Output voltage ripple	$C_{out} = 220\ \mu\text{F}$ with 7-m Ω ESR + 100- μF X7R + 2 x 0.047- μF BW at 20 MHz			9		mV _{PP}
$\Delta V_O/\Delta V_{IN}$	Line regulation	$V_{IN} = 12\text{ V}$ to 36 V, $I_O = 0.001\text{ A}$			$\pm 0.02\%$

7 Detailed Description

7.1 Overview

The architecture used is an internally compensated emulated peak current mode control, based on a monolithic synchronous SIMPLE SWITCHER core capable of supporting high load currents. The output voltage is maintained through feedback compared with an internal 0.8-V reference. For emulated peak current-mode, the valley current is sampled on the down-slope of the inductor current. This is used as the DC value of current to start the next cycle.

The primary application for emulated peak current-mode is high input voltage to low output voltage operating at a narrow duty cycle. By sampling the inductor current at the end of the switching cycle and adding an external ramp, the minimum ON-time can be significantly reduced, without the need for blanking or filtering which is normally required for peak current-mode control.

7.2 Functional Block Diagram

7.3 Feature Description

7.3.1 Synchronization Input

The PWM switching frequency can be synchronized to an external frequency source. If this feature is not used, connect this input either directly to ground, or connect to ground through a resistor of 1.5-k Ω or less. The allowed synchronization frequency range is 650 kHz to 950 kHz. The typical input threshold is 1.4-V transition level. Ideally the input clock must overdrive the threshold by a factor of 2, so direct drive from 3.3-V logic through a 1.5-k Ω Thevenin source resistance is recommended. Applying a sustained logic 1 corresponds to zero Hz PWM frequency and will cause the module to stop switching.

7.3.2 Output Overvoltage Protection

If the voltage at FB is greater than a 0.86-V internal reference, the output of the error amplifier is pulled toward ground, causing V_O to fall.

7.3.3 Current Limit

The LMZ23603 is protected by both low-side (LS) and high-side (HS) current limit circuitry. The LS current limit detection is carried out during the OFF-time by monitoring the current through the LS synchronous MOSFET. Referring to the [Functional Block Diagram](#), when the top MOSFET is turned off, the inductor current flows through the load, the PGND pin and the internal synchronous MOSFET. If this current exceeds the low-side current limit level the current limit comparator disables the start of the next switching period. Switching cycles are prohibited until current drops below the limit.

Feature Description (continued)

NOTE

DC current limit is dependent on both duty cycle and temperature as illustrated in the graphs in the [Typical Characteristics](#) section.

The HS current limit monitors the current of top side MOSFET. Once HS current limit is detected, the HS MOSFET is shutoff immediately, until the next cycle. Exceeding HS current limit causes V_O to fall. Typical behavior of exceeding LS current limit is that f_{sw} drops to 1/2 of the operating frequency.

7.3.4 Thermal Protection

The junction temperature of the LMZ23603 must not be allowed to exceed its maximum ratings. Thermal protection is implemented by an internal Thermal Shutdown circuit which activates at 165°C (typical) causing the device to enter a low power standby state. In this state the main MOSFET remains off causing V_O to fall, and additionally the C_{SS} capacitor is discharged to ground. Thermal protection helps prevent catastrophic failures for accidental device overheating. When the junction temperature falls back below 150°C (typical hysteresis = 15°C) the SS pin is released, V_O rises smoothly, and normal operation resumes.

Applications requiring maximum output current especially those at high input voltage may require additional derating at elevated temperatures.

7.3.5 Prebiased Start-Up

The LMZ23603 will properly start up into a prebiased output. This start-up situation is common in multiple rail logic applications where current paths may exist between different power rails during the start-up sequence. [Figure 46](#) shows proper behavior in this mode. Trace one is Enable going high. Trace two is 1.5-V prebias rising to 3.3 V. Rise-time determined by C_{SS} , trace three.

Figure 46. Prebiased Start-Up

7.4 Device Functional Modes

7.4.1 Discontinuous Conduction and Continuous Conduction Modes

At light load the regulator will operate in discontinuous conduction mode (DCM). With load currents above the critical conduction point, it will operate in continuous conduction mode (CCM). In CCM, current flows through the inductor through the entire switching cycle and never falls to zero during the OFF-time. When operating in DCM, inductor current is maintained to an average value equaling I_{OUT} . Inductor current exhibits normal behavior for the emulated current mode control method used. Output voltage ripple typically increases during this mode of operation.

Figure 47 is a comparison pair of waveforms of the showing both CCM (upper) and DCM operating modes.

$V_{IN} = 12V$, $V_O = 3.3V$, $I_O = 3 A / 0.3 A$ 2 $\mu s/div$

Figure 47. CCM and DCM Operating Modes

8 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

The LMZ23603 is a step-down DC-to-DC power module. It is typically used to convert a higher DC voltage to a lower DC voltage with a maximum output current of 3 A. The following design procedure can be used to select components for the LMZ23603. Alternately, the WEBENCH software may be used to generate complete designs.

When generating a design, the WEBENCH software uses iterative design procedure and accesses comprehensive databases of components. Please go to www.ti.com for more details.

8.2 Typical Application

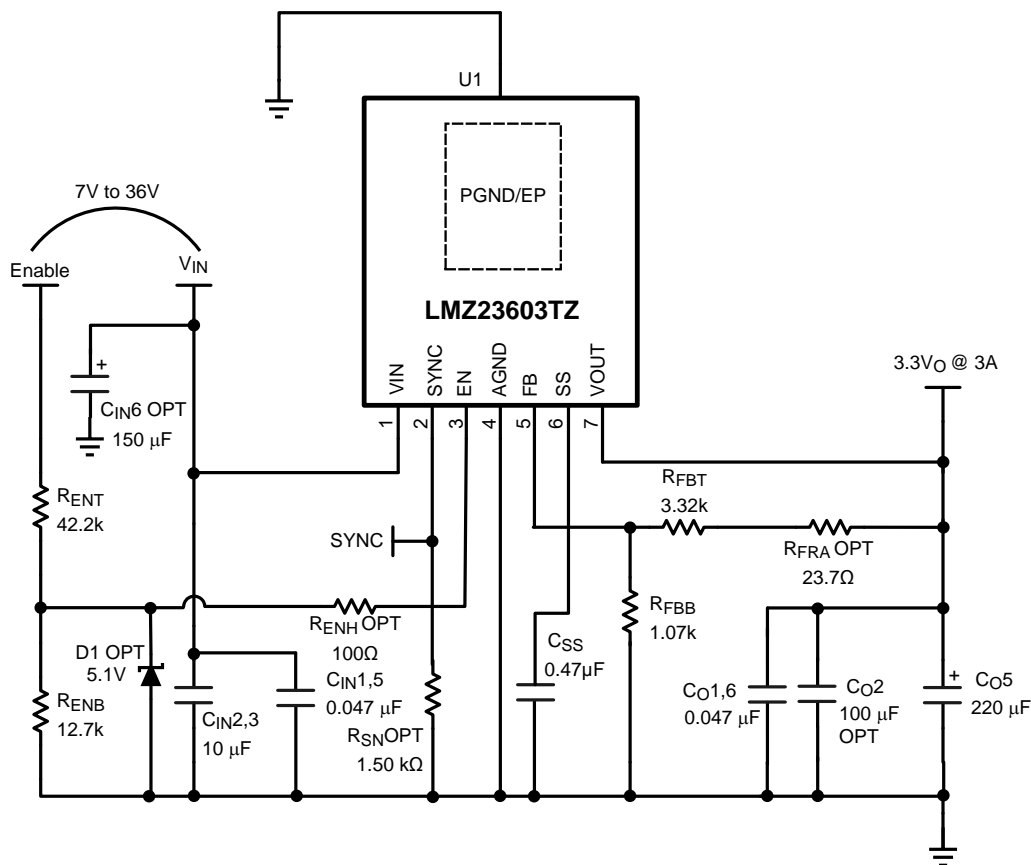

Figure 48. Simplified Evaluation Board Schematic Diagram

8.2.1 Design Requirements

For this example the following application parameters exist.

- V_{IN} Range = Up to 36 V
- V_{OUT} = 0.8 V to 6 V
- I_{OUT} = 3 A

Typical Application (continued)

8.2.2 Detailed Design Procedure

8.2.2.1 Design Steps

The LMZ23603 is fully supported by WEBENCH which offers: component selection, electrical and thermal simulations. Additionally there are both evaluation and demonstration boards that may be used as a starting point for design. The following list of steps can be used to manually design the LMZ23603 application.

All references to values refer to [Figure 48](#).

1. Select minimum operating V_{IN} with enable divider resistors
2. Program V_O with resistor divider selection
3. Select C_O
4. Select C_{IN}
5. Determine module power dissipation
6. Layout PCB for required thermal performance

8.2.2.2 Enable Divider, R_{ENT} , R_{ENB} and R_{ENH} Selection

Internal to the module is a 2-M Ω pullup resistor connected from V_{IN} to Enable. For applications not requiring precision undervoltage lockout (UVLO), the Enable input may be left open circuit and the internal resistor will always enable the module. In such case, the internal UVLO occurs around 4.3 V.

In applications with separate supervisory circuits Enable can be directly interfaced to a logic source. In the case of sequencing supplies, the divider is connected to a rail that becomes active earlier in the power-up cycle than the LMZ23603 output rail.

Enable provides a precise 1.279-V threshold to allow direct logic drive or connection to a voltage divider from a higher enable voltage such as V_{IN} . Additionally there is 21 μ A (typical) of switched offset current allowing programmable hysteresis. See [Figure 49](#).

The function of the enable divider is to allow the designer to choose an input voltage below which the circuit will be disabled. This implements the feature of programmable UVLO. The two resistors must be chosen based on the following ratio:

$$R_{ENT} / R_{ENB} = (V_{IN\ UVLO} / 1.279\ V) - 1 \quad (1)$$

The LMZ23603 typical application shows 12.7 k Ω for R_{ENB} and 42.2 k Ω for R_{ENT} resulting in a rising UVLO of 5.46 V. This divider presents 8.33 V to the input when the divider is raised to 36 V which would exceed the recommended 5.5-V limit for Enable. A midpoint 5.1-V Zener clamp is applied to allow the application to cover the full 6-V to 36-V range of operation. The Zener clamp is not required if the target application prohibits the maximum Enable input voltage from being exceeded.

Additional enable voltage hysteresis can be added with the inclusion of R_{ENH} . It is possible to select values for R_{ENT} and R_{ENB} such that R_{ENH} is a value of zero allowing it to be omitted from the design.

Rising threshold can be calculated as follows:

$$V_{EN(rising)} = 1.279 (1 + (R_{ENT} || 2\ meg) / R_{ENB}) \quad (2)$$

Whereas the falling threshold level can be calculated using:

$$V_{EN(falling)} = V_{EN(rising)} - 21\ \mu A (R_{ENT} || 2\ meg || R_{ENTB} + R_{ENH}) \quad (3)$$

Typical Application (continued)

Figure 49. Enable Input Detail
8.2.2.3 Output Voltage Selection

Output voltage is determined by a divider of two resistors connected between V_O and ground. The midpoint of the divider is connected to the FB input.

The regulated output voltage determined by the external divider resistors $R_{F_{BT}}$ and $R_{F_{BB}}$ is:

$$V_O = 0.796 \text{ V} \times (1 + R_{F_{BT}} / R_{F_{BB}}) \quad (4)$$

Rearranging terms; the ratio of the feedback resistors for a desired output voltage is:

$$R_{F_{BT}} / R_{F_{BB}} = (V_O / 0.796 \text{ V}) - 1 \quad (5)$$

These resistors must generally be chosen from values in the range of 1.0 kΩ to 10.0 kΩ.

For $V_O = 0.8 \text{ V}$ the FB pin can be connected to the output directly and $R_{F_{BB}}$ can be set to 8.06 kΩ to provide minimum output load.

Table 1 lists values for $R_{F_{BT}}$, and $R_{F_{BB}}$.

8.2.2.4 Soft-Start Capacitor Selection

Programmable soft-start permits the regulator to slowly ramp to its steady state operating point after being enabled, thereby reducing current inrush from the input supply and slowing the output voltage rise-time.

Upon turnon, after all UVLO conditions have been passed, an internal 1.6-ms circuit slowly ramps the SS/TRK input to implement internal soft-start. If 1.6 ms is an adequate turnon time then the C_{SS} capacitor can be left unpopulated. Longer soft-start periods are achieved by adding an external capacitor to this input.

Soft-start duration is given by the formula:

$$t_{SS} = V_{REF} \times C_{SS} / I_{SS} = 0.796 \text{ V} \times C_{SS} / 50 \mu\text{A} \quad (6)$$

This equation can be rearranged as follows:

$$C_{SS} = t_{SS} \times 50 \mu\text{A} / 0.796 \text{ V} \quad (7)$$

Using a 0.22- μF capacitor results in 3.5-ms typical soft-start duration; and 0.47- μF results in 7.5 ms typical. 0.47 μF is a recommended initial value.

As the soft-start input exceeds 0.796 V the output of the power stage will be in regulation and the 50- μA current is deactivated. The following conditions will reset the soft-start capacitor by discharging the SS input to ground with an internal current sink.

- The Enable input being *pulled low*
- Thermal shutdown condition
- Internal V_{CC} UVLO (Approx 4.3-V input to V_{IN})

8.2.2.5 Tracking Supply Divider Option

The tracking function allows the module to be connected as a slave supply to a primary voltage rail (often the 3.3-V system rail) where the slave module output voltage is lower than that of the master. Proper configuration allows the slave rail to power up coincident with the master rail such that the voltage difference between the rails during ramp-up is small (that is, < 0.15 V typical). The values for the tracking resistive divider must be selected such that the presence of the internal 50- μA current source is minimized. In most cases the ratio of the tracking divider resistors is the same as the ratio of the output voltage setting divider. Proper operation in tracking mode dictates the soft-start time of the slave rail be shorter than the master rail; a condition that is easy satisfy because the C_{SS} cap is replaced by R_{TKB}. The tracking function is only supported for the power up interval of the master supply; once the SS/TRK rises past 0.8 V the input is no longer enabled and the 50- μA internal current source is switched off.

Figure 50. Tracking Option Input Detail

8.2.2.6 C_O Selection

None of the required C_O output capacitance is contained within the module. A minimum value of 200 μF is required based on the values of internal compensation in the error amplifier. Low ESR tantalum, organic semiconductor or specialty polymer capacitor types are recommended for obtaining lowest ripple. The output capacitor C_O may consist of several capacitors in parallel placed in close proximity to the module. The output capacitor assembly must also meet the worst case minimum ripple current rating of 0.5 × I_{LR P-P}, as calculated in Equation 14 below. Beyond that, additional capacitance will reduce output ripple so long as the ESR is low enough to permit it. Loop response verification is also valuable to confirm closed loop behavior. R_{LRA} is included on the typical application schematic and evaluation board for this purpose. It is not required in the end design.

For applications with dynamic load steps; the following equation provides a good first pass approximation of C_O for load transient requirements. Where V_{O-Tran} is 100 mV on a 3.3-V output design.

$$C_O \geq I_{O-Tran} / ((V_{O-Tran} - ESR \times I_{O-Tran}) \times (F_{SW} / V_O)) \quad (8)$$

Solving:

$$C_O \geq 2.5 \text{ A} / ((0.1 \text{ V} - .007 \times 2.5 \text{ A}) \times (800000 \text{ Hz} / 3.3 \text{ V})) \geq 125 \mu\text{F} \quad (9)$$

NOTE

The stability requirement for 200-μF minimum output capacitance will take precedence.

One recommended output capacitor combination is a 220-μF, 7-mΩ ESR specialty polymer cap in parallel with a 100-μF, 6.3-V X5R ceramic. This combination provides excellent performance that may exceed the requirements of certain applications. Additionally some small ceramic capacitors can be used for high frequency EMI suppression.

8.2.2.7 C_{IN} Selection

The LMZ23603 module contains a small amount of internal ceramic input capacitance. Additional input capacitance is required external to the module to handle the input ripple current of the application. The input capacitor can be several capacitors in parallel. This input capacitance must be located in very close proximity to the module. Input capacitor selection is generally directed to satisfy the input ripple current requirements rather than by capacitance value. Input ripple current rating is dictated by the equation:

$$I(C_{IN(RMS)}) \approx 1/2 \times I_O \times \text{SQRT}(D / (1-D))$$

where

- $D \approx V_O / V_{IN}$ (10)

As a point of reference, the worst case ripple current will occur when the module is presented with full load current and when V_{IN} = 2 × V_O.

Recommended minimum input capacitance is 22-μF X7R (or X5R) ceramic with a voltage rating at least 25% higher than the maximum applied input voltage for the application. It is also recommended that attention be paid to the voltage and temperature derating of the capacitor selected.

NOTE

Ripple current rating of ceramic capacitors may be missing from the capacitor data sheet and you may have to contact the capacitor manufacturer for this parameter.

If the system design requires a certain minimum value of peak-to-peak input ripple voltage (ΔV_{IN}) be maintained then the following equation may be used.

$$C_{IN} \geq I_O \times D \times (1-D) / f_{SW-CCM} \times \Delta V_{IN} \quad (11)$$

If ΔV_{IN} is 1% of V_{IN} for a 12-V input to 3.3-V output application this equals 120 mV and f_{SW} = 812 kHz.

$$C_{IN} \geq 3 \text{ A} \times 3.3 \text{ V} / 12 \text{ V} \times (1 - 3.3 \text{ V} / 12 \text{ V}) / (812000 \times 0.240 \text{ V}) \geq 22.3 \mu\text{F} \quad (12)$$

Additional bulk capacitance with higher ESR may be required to damp any resonant effects of the input capacitance and parasitic inductance of the incoming supply lines. The LMZ23603 typical applications schematic and evaluation board include a 150-μF, 50-V aluminum capacitor for this function. There are many situations where this capacitor is not necessary.

8.2.2.8 Discontinuous Conduction and Continuous Conduction Modes Selection

The approximate formula for determining the DCM/CCM boundary is as follows:

$$I_{DCB} \approx V_O \times (V_{IN} - V_O) / (2 \times 3.3 \mu\text{H} \times f_{SW(\text{CCM})} \times V_{IN}) \tag{13}$$

The inductor internal to the module is 3.3 μH . This value was chosen as a good balance between low and high input voltage applications. The main parameter affected by the inductor is the amplitude of the inductor ripple current (I_{LR}). I_{LR} can be calculated with:

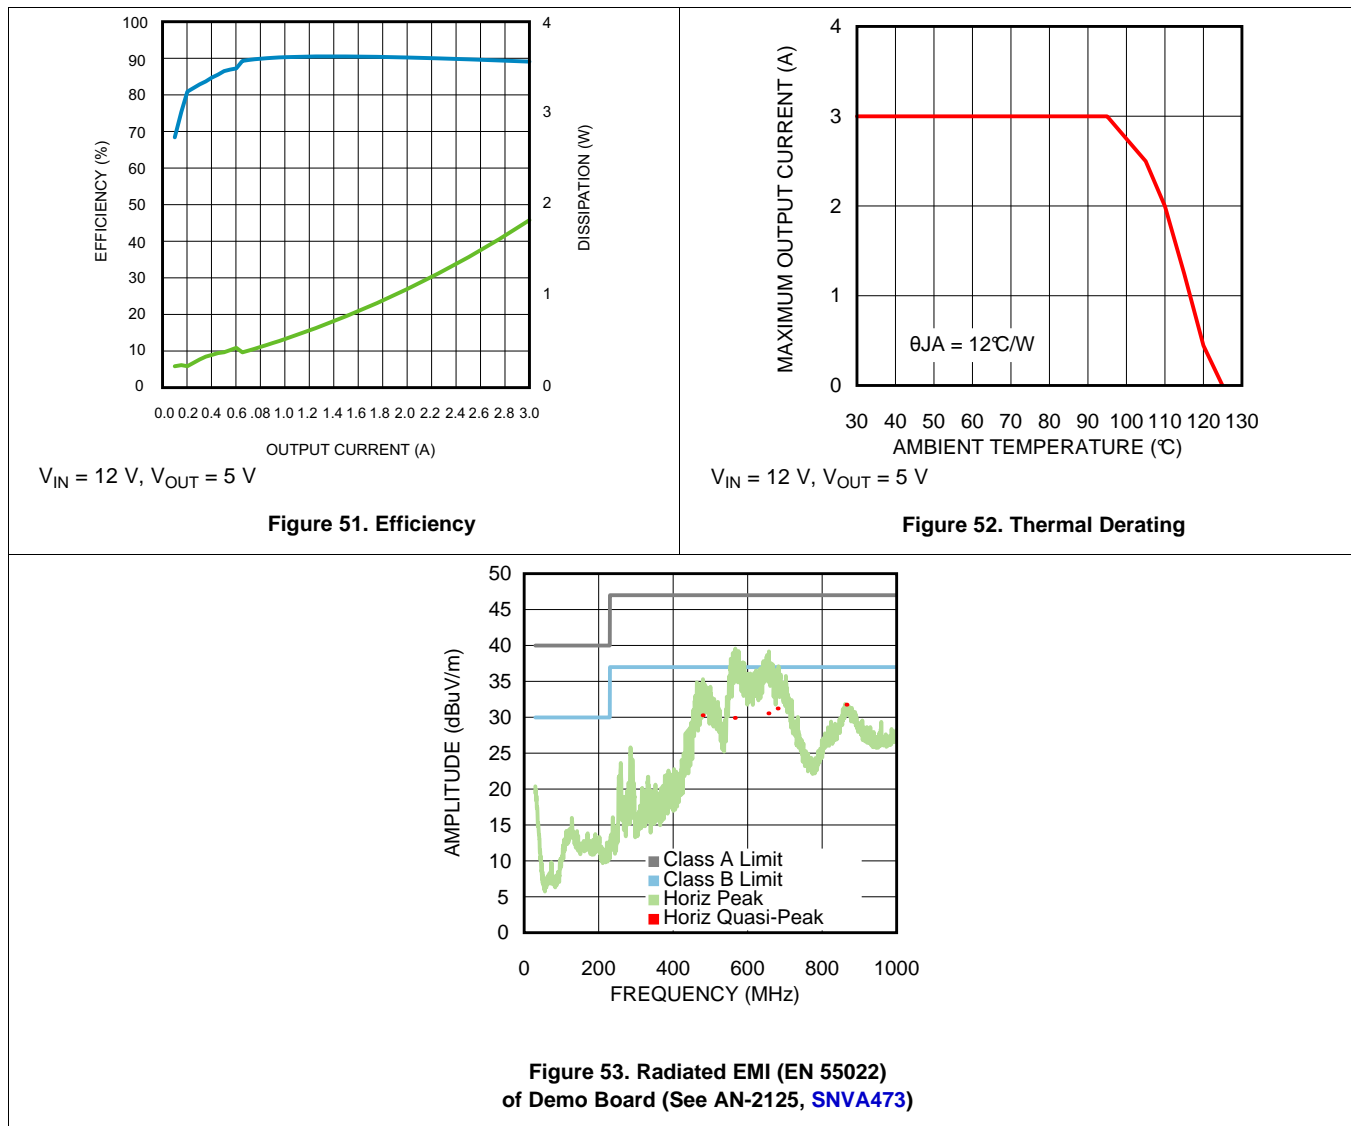

$$I_{LR \text{ P-P}} = V_O \times (V_{IN} - V_O) / (3.3 \mu\text{H} \times f_{SW} \times V_{IN})$$

where

- V_{IN} is the maximum input voltage
 - f_{SW} is typically 812 kHz
- (14)

If the output current I_O is determined by assuming that $I_O = I_L$, the higher and lower peak of I_{LR} can be determined.

8.2.3 Application Curves

9 Power Supply Recommendations

The LMZ23603 device is designed to operate from an input voltage supply range between 6 V and 36 V. This input supply must be well regulated and able to withstand maximum input current and maintain a stable voltage. The resistance of the input supply rail must be low enough that an input current transient does not cause a high enough drop at the LMZ23603 supply voltage that can cause a false UVLO fault triggering and system reset. If the input supply is more than a few inches from the LMZ23603, additional bulk capacitance may be required in addition to the ceramic bypass capacitors. The amount of bulk capacitance is not critical, but a 47- μ F or 100- μ F electrolytic capacitor is a typical choice.

10 Layout

10.1 Layout Guidelines

PCB layout is an important part of DC-DC converter design. Poor board layout can disrupt the performance of a DC-DC converter and surrounding circuitry by contributing to EMI, ground bounce and resistive voltage drop in the traces. These can send erroneous signals to the DC-DC converter resulting in poor regulation or instability. Good layout can be implemented by following a few simple design rules.

1. Minimize area of switched current loops.

From an EMI reduction standpoint, it is imperative to minimize the high di/dt paths during PCB layout as shown in [Figure 54](#). The high current loops that do not overlap have high di/dt content that will cause observable high-frequency noise on the output pin if the input capacitor (C_{IN1}) is placed at a distance away from the LMZ23603. Therefore place C_{IN1} as close as possible to the LMZ23603 VIN and PGND exposed pad. This will minimize the high di/dt area and reduce radiated EMI. Additionally, grounding for both the input and output capacitor must consist of a localized top side plane that connects to the PGND exposed pad (EP).

2. Have a single point ground.

The ground connections for the feedback, soft-start, and enable components must be routed to the AGND pin of the device. This prevents any switched or load currents from flowing in the analog ground traces. If not properly handled, poor grounding can result in degraded load regulation or erratic output voltage ripple behavior. Additionally provide the single point ground connection from pin 4 (AGND) to EP/PGND.

3. Minimize trace length to the FB pin.

Both feedback resistors, R_{FBT} and R_{FBB} must be located close to the FB pin. Because the FB node is high impedance, maintain the copper area as small as possible. The traces from R_{FBT} , R_{FBB} must be routed away from the body of the LMZ23603 to minimize possible noise pickup.

4. Make input and output bus connections as wide as possible.

This reduces any voltage drops on the input or output of the converter and maximizes efficiency. To optimize voltage accuracy at the load, ensure that a separate feedback voltage sense trace is made to the load. Doing so will correct for voltage drops and provide optimum output accuracy.

5. Provide adequate device heat-sinking.

Use an array of heat-sinking vias to connect the exposed pad to the ground plane on the bottom PCB layer. If the PCB has a plurality of copper layers, these thermal vias can also be employed to make connection to inner layer heat-spreading ground planes. For best results use a 6 × 10 via array with a minimum via diameter of 8 mils thermal vias spaced 59 mils (1.5 mm). Ensure enough copper area is used for heat-sinking to keep the junction temperature below 125°C.

10.3 Power Dissipation and Thermal Considerations

When calculating module dissipation use the maximum input voltage and the average output current for the application. Many common operating conditions are provided in the characteristic curves such that less common applications can be derived through interpolation. In all designs, the junction temperature must be kept below the rated maximum of 125°C.

For the design case of $V_{IN} = 24\text{ V}$, $V_O = 3.3\text{ V}$, $I_O = 3\text{ A}$, and $T_{AMB(MAX)} = 85^\circ\text{C}$, the module must see a thermal resistance from case to ambient of less than:

$$R_{\theta CA} < (T_{J-MAX} - T_{A-MAX}) / P_{IC-LOSS} - R_{\theta JC} \tag{15}$$

Given the typical thermal resistance from junction to case to be 1.9°C/W. Use the 85°C power dissipation curves in the [Typical Characteristics](#) section to estimate the $P_{IC-LOSS}$ for the application being designed. In this application it is 3 W.

$$R_{\theta CA} = (125 - 85) / 3\text{ W} - 1.9 = 11.4 \tag{16}$$

Power Dissipation and Thermal Considerations (continued)

To reach $R_{\theta CA} = 11.4.$, the PCB is required to dissipate heat effectively. With no airflow and no external heat, a good estimate of the required board area covered by 2 oz. copper on both the top and bottom metal layers is:

$$\text{Board_Area_cm}^2 = 500^{\circ}\text{C} \times \text{cm}^2/\text{W} / R_{\theta CA} \tag{17}$$

As a result, approximately 44 square cm of 2-oz copper on top and bottom layers is required for the PCB design. The PCB copper heat sink must be connected to the exposed pad. Approximately sixty, 8 mil thermal vias spaced 39 mils (1.0 mm) apart connect the top copper to the bottom copper. For an example of a high thermal performance PCB layout for SIMPLE SWITCHER power modules, refer to AN-2085 (SNVA457), AN-2125 (SNVA473), AN-2020 (SNVA419) and AN-2026 (SNVA424).

10.4 Power Module SMT Guidelines

The recommendations below are for a standard module surface mount assembly

- Land Pattern — Follow the PCB land pattern with either soldermask defined or non-soldermask defined pads
- Stencil Aperture
 - For the exposed die attach pad (DAP), adjust the stencil for approximately 80% coverage of the PCB land pattern
 - For all other I/O pads use a 1:1 ratio between the aperture and the land pattern recommendation
- Solder Paste — Use a standard SAC Alloy such as SAC 305, type 3 or higher
- Stencil Thickness — 0.125 to 0.15 mm
- Reflow — Refer to solder paste supplier recommendation and optimized per board size and density
- Refer to *Design Summary LMZ1xxx and LMZ2xxx Power Modules Family* (SNAA214) for reflow information
- Maximum number of reflows allowed is one

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/production> information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in special applications.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based wire bonds used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb not allowed in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is present on the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may vary by device and value exceeds the maximum column width.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
