# Low-Noise, High-Speed, 16-Bit Accurate, CMOS OPERATIONAL AMPLIFIER 

## FEATURES

- High Bandwidth: 150MHz
- 16-Bit Settling in 150ns
- Low Noise: $3 \mathrm{nV} / \sqrt{\mathrm{Hz}}$
- Low Distortion: 0.003\%
- Low Power: 9.5mA (typ) on 5.5V
- Shutdown to $5 \mu \mathrm{~A}$
- Unity-Gain Stable
- Excellent Output Swing:
(V+) -100 mV to (V-) +100 mV
- Single Supply: +2.7 V to +5.5 V
- Tiny Packages: MSOP and SOT23

## APPLICATIONS

- 16-Bit ADC Input Drivers
- Low-Noise Preamplifiers
- IF/RF Amplifiers
- Active Filtering

## DESCRIPTION

The OPA300 and OPA301 series high-speed, voltage-feedback, CMOS operational amplifiers are designed for 16 -bit resolution systems. The OPA300/OPA301 series are unity-gain stable and feature excellent settling and harmonic distortion specifications. Low power applications benefit from low quiescent current. The OPA300 and OPA2300 feature a digital shutdown (Enable) function to provide additional power savings during idle periods. Optimized for single-supply operation, the OPA300/OPA301 series offer superior output swing and excellent common-mode range.
The OPA300 and OPA301 series op amps have 150 MHz of unity-gain bandwidth, low $3 \mathrm{nV} / \sqrt{\mathrm{Hz}}$ voltage noise, and $0.1 \%$ settling within 30ns. Single-supply operation from $2.7 \mathrm{~V}( \pm 1.35 \mathrm{~V})$ to $5.5 \mathrm{~V}( \pm 2.75 \mathrm{~V})$ and an available shutdown function that reduces supply current to $5 \mu \mathrm{~A}$ are useful for portable low-power applications. The OPA300 and OPA301 are available in SO-8 and SOT-23 packages. The OPA2300 is available in MSOP-10, and the OPA2301 is available in SO-8 and MSOP-8. All versions are specified over the industrial temperature range of $-40^{\circ} \mathrm{C}$ to $+125^{\circ} \mathrm{C}$.

Typical Application

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

## PACKAGE/ORDERING INFORMATION(1)

| PRODUCT | PACKAGE-LEAD | PACKAGE DESIGNATOR | PACKAGE MARKING |
| :---: | :---: | :---: | :---: |
| OPA300 | SO-8 | D | 300 A |
| OPA300 | SOT23-6 | DBV | A52 |
| OPA301 | SO-8 | D | 301 A |
| OPA301 | SOT23-5 | DBV | AUP |
| OPA2300 | MSOP-10 | DGS | C01 |
| OPA2301 | SO-8 | D | OPA2301A |
| OPA2301 | MSOP-8 | DGK | OAWM |

(1) For the most current package and ordering information, see the Package Option Addendum at the end of this document, or see the TI website at www.ti.com.

## ABSOLUTE MAXIMUM RATINGS

over operating free-air temperature range unless otherwise noted ${ }^{(1)}$

| Power Supply V+ | 7V |
| :---: | :---: |
| Signal Input Terminals(2), Voltage | 5 V to $(\mathrm{V}+)+0.5 \mathrm{~V}$ |
| Curren | $\pm 10 \mathrm{~mA}$ |
| Open Short-Circuit Current(3) | Continuous |
| Operating Temperature Range | $-55^{\circ} \mathrm{C}$ to $+125^{\circ} \mathrm{C}$ |
| Storage Temperature Range | $-60^{\circ} \mathrm{C}$ to $+150^{\circ} \mathrm{C}$ |
| Junction Temperature . | $+150^{\circ} \mathrm{C}$ |
| ESD Ratings |  |
| Human Body Model (HBM) . | 4kV |
| Charged-Device Model (CDM) | 500 V |

(1) Stresses above these ratings may cause permanent damage. Exposure to absolute maximum conditions for extended periods may degrade device reliability. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those specified is not implied.
(2) Input terminals are diode clamped to the power-supply rails. Input signals that can swing more than 0.5 V beyond the supply rails should be current limited to 10 mA or less.
(3) Short-circuit to ground; one amplifier per package.

## ELECTROSTATIC DISCHARGE SENSITIVITY

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

## PIN ASSIGNMENTS

## ELECTRICAL CHARACTERISTICS: $\mathrm{V}_{\mathrm{S}}=2.7 \mathrm{~V}$ to 5.5 V

Boldface limits apply over the temperature range, $\mathrm{T}_{\mathrm{A}}=-40^{\circ} \mathrm{C}$ to $+125^{\circ} \mathrm{C}$.
All specifications at $\mathrm{T}_{\mathrm{A}}=+25^{\circ} \mathrm{C}, \mathrm{R}_{\mathrm{L}}=2 \mathrm{k} \Omega$ connected to $\mathrm{V}_{\mathrm{S}} / 2, \mathrm{~V}_{\mathrm{OUT}}=\mathrm{V}_{\mathrm{S}} / 2$, and $\mathrm{V}_{\mathrm{CM}}=\mathrm{V}_{\mathrm{S}} / 2$, unless otherwise noted.

## APPLICATIONS INFORMATION

The OPA300 and OPA301 series of single-supply CMOS op amps are designed to interface with high-speed 16-bit analog-to-digital converters (ADCs). Featuring wide 150 MHz bandwidth, fast 150 ns settling time to 16 bits, and high open loop gain, this series offers excellent performance in a small SO-8 and tiny SOT23 packages.

## THEORY OF OPERATION

The OPA300 and OPA301 series op amps use a classic two-stage topology, shown in Figure 1. The differential input pair is biased to maximize slew rate without compromising stability or bandwidth. The folded cascode adds the signal from the input pair and presents a differential signal to the class $A B$ output stage. The class $A B$ output stage allows rail- to-rail output swing, with high-impedance loads ( $>2 \mathrm{k} \Omega$ ), typically 100 mV from the supply rails. With $10 \Omega$ loads, a useful output swing can be achieved and still maintain high open-loop gain. See the typical characteristic Output Voltage Swing vs Output Current.

Figure 1. OPA30x Classic Two-Stage Topology

## OPERATING VOLTAGE

OPA300/OPA301 series op amp parameters are fully specified from +2.7 V to +5.5 V . Supply voltages higher than 5.5 V (absolute maximum) can cause permanent damage to the amplifier. Many specifications apply from $-40^{\circ} \mathrm{C}$ to $+125^{\circ} \mathrm{C}$. Parameters that vary significantly with operating voltages or temperature are shown in the Typical Characteristics.

## PCB LAYOUT

As with most high-speed operational amplifiers, board layout requires special attention to maximize AC and DC performance. Extensive use of ground planes, short lead lengths, and high-quality bypass capacitors will minimize leakage that can compromise signal quality. Guard rings applied with potential as near to the input pins as possible help minimize board leakage.

## INPUT AND ESD PROTECTION

All OPA300/OPA301 series op amps' pins are staticprotected with internal ESD protection diodes tied to the supplies, as shown in Figure 2. These diodes will provide overdrive protection if the current is externally limited to 10 mA , as stated in the Absolute Maximum Ratings. Any input current beyond the Absolute Maximum Ratings, or long-term operation at maximum ratings, will shorten the lifespan of the amplifier.

Figure 2. ESD Protection Diodes

## ENABLE FUNCTION

The shutdown function of the OPA300 and OPA2300 is referenced to the negative supply voltage of the operational amplifier. A logic level HIGH enables the op amp. A valid logic HIGH is defined as 2.5 V above the negative supply applied to the enable pin. A valid logic LOW is defined as $<0.8 \mathrm{~V}$ above the negative supply pin. If dual or split power supplies are used, care should be taken to ensure logic input signals are properly referred to the negative supply voltage. If this pin is not connected to a valid high or low voltage, the internal circuitry will pull the node high and enable the part to function.

The logic input is a high-impedance CMOS input. For battery-operated applications, this feature may be used to greatly reduce the average current and extend battery life. The enable time is $10 \mu \mathrm{~s}$; disable time is $1 \mu \mathrm{~s}$. When disabled, the output assumes a high-impedance state. This allows the OPA300 to be operated as a gated amplifier, or to have its output multiplexed onto a common analog output bus.

## DRIVING CAPACITIVE LOADS

When using high-speed operational amplifiers, it is extremely important to consider the effects of capacitive loading on amplifier stability. Capacitive loading will interact with the output impedance of the operational amplifier, and depending on the capacitor value, may significantly decrease the gain bandwidth, as well as introduce peaking. To reduce the effects of capacitive loading and allow for additional capacitive load drive, place a series resistor between the output and the load. This will reduce available bandwidth, but permit stable operation with capacitive loading. Figure 3 illustrates the recommended relationship between the resistor and capacitor values.

Figure 3. Recommended $R_{S}$ and $C_{L}$ Combinations

Amplifiers configured in unity gain are most susceptible to stability issues. The typical characteristic, Frequency Response vs Capacitive Load, describes the relationship between capacitive load and stability for the OPA300/OPA301 series. In unity gain, the OPA300/OPA301 series is capable of driving a few picofarads of capacitive load without compromising stability. Board level parasitic capacitance can often fall into the range of a picofarad or more, and should be minimized through good circuit-board layout practices to avoid compromising the stability of the OPA300/OPA301. For more information on detecting parasitics during testing, see the Application Note Measuring Board Parasitics in High-Speed Analog Design (SBOA094), available at the TI web site www.ti.com.

## DRIVING A 16-BIT ADC

The OPA300/OPA301 series feature excellent THD+noise, even at frequencies greater than 1 MHz , with a 16 -bit settling time of 150 ns. Figure 4 shows a total single supply solution for high-speed data acquisition. The OPA300/OPA301 directly drives the ADS8401, a 1.25 mega sample per second (MSPS) 16 -bit data converter. The OPA300/OPA301 is configured in an inverting gain of 1 , with a 5 V single supply. Results of the OPA300/OPA301 performance are summarized in Table 1.

Figure 4. The OPA30x Drives the 16-Bit ADS8401

| PARAMETER | RESULTS $(\mathbf{f}=\mathbf{1 0 k H z})$ |
| :---: | :---: |
| THD | $-\mathbf{9 9 . 3 \mathrm { dB }}$ |
| SFDR | 101.2 dB |
| THD+N | 84.2 dB |
| SNR | 84.3 dB |

${ }^{(1)}$ The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.
${ }^{(2)}$ RoHS: TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance
do not exceed $0.1 \%$ by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption
Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement
${ }^{(3)}$ MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.
${ }^{(4)}$ There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device
${ }^{(5)}$ Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.
${ }^{(6)}$ Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. Refernce JEDEC MO-178.
4. Body dimensions do not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.25 mm per side.

SOLDER MASK DETAILS

NOTES: (continued)
5. Publication IPC-7351 may have alternate designs.
6. Solder mask tolerances between and around signal pads can vary based on board fabrication site.

SOLDER PASTE EXAMPLE
BASED ON 0.125 mm THICK STENCIL
SCALE:15X

NOTES: (continued)
7. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
8. Board assembly site may have different recommendations for stencil design.

## NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15 mm per side.
4. This dimension does not include interlead flash. Interlead flash shall not exceed 0.25 mm per side.
5. Reference JEDEC registration MO-187, variation BA.

NOTES: (continued)
6. Publication IPC-7351 may have alternate designs.
7. Solder mask tolerances between and around signal pads can vary based on board fabrication site.

SOLDER PASTE EXAMPLE BASED ON 0.125 mm THICK STENCIL SCALE:10X

NOTES: (continued)
8. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
9. Board assembly site may have different recommendations for stencil design.

NOTES:

1. Linear dimensions are in inches [millimeters]. Dimensions in parenthesis are for reference only. Controlling dimensions are in inches. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed . 006 [0.15] per side.
4. This dimension does not include interlead flash.
5. Reference JEDEC registration MS-012, variation AA.

SOLDER MASK DETAILS

NOTES: (continued)
6. Publication IPC-7351 may have alternate designs.
7. Solder mask tolerances between and around signal pads can vary based on board fabrication site.

NOTES: (continued)
8. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
9. Board assembly site may have different recommendations for stencil design.

## NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. Body dimensions do not include mold flash or protrusion. Mold flash and protrusion shall not exceed 0.25 per side.
4. Leads $1,2,3$ may be wider than leads $4,5,6$ for package orientation.
5. Refernce JEDEC MO-178.

SOLDER MASK DETAILS

NOTES: (continued)
6. Publication IPC-7351 may have alternate designs.
7. Solder mask tolerances between and around signal pads can vary based on board fabrication site.

SOLDER PASTE EXAMPLE
BASED ON 0.125 mm THICK STENCIL
SCALE:15X

NOTES: (continued)
8. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
9. Board assembly site may have different recommendations for stencil design.

NOTES: A. All linear dimensions are in millimeters.
B. This drawing is subject to change without notice.

C Body length does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15 per end.
D Body width does not include interlead flash. Interlead flash shall not exceed 0.50 per side.
E. Falls within JEDEC MO-187 variation AA, except interlead flash.

## DGK (S-PDSO-G8)

## PLAStic SmALL OUTLINE PACKAGE

NOTES:
A. All linear dimensions are in millimeters.
B. This drawing is subject to change without notice.
C. Publication IPC-7351 is recommended for alternate designs.
D. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC-7525 for other stencil recommendations.
E. Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.
