TPA2026D2

SLOS649B –MARCH 2010–REVISED MAY 2016

TPA2026D2 3.2-W/Ch Stereo Class-D Audio Amplifier With Fast Gain Ramp SmartGain™ Automatic Gain Control and Dynamic Range Compression

Technical Documents

1 Features

- Fast AGC Start-Up Time: 5 ms
- Pinout Compatible With TPA2016D2
- Filter-Free Class-D Architecture
- 3.2 W/Ch Into 4 Ω at 5 V (10% THD+N)
- 750 mW/Ch Into 8 Ω at 3.6 V (10% THD+N)
- Power Supply Range: 2.5 V to 5.5 V
- Flexible Operation With or Without I²C
- Programmable DRC and AGC Parameters
- Digital I²C Volume Control
- Selectable Gain from 0 dB to 30 dB in 1-dB Steps
- Selectable Attack, Release, and Hold Times
- 4 Selectable Compression Ratios
- Low Supply Current: 3.5 mA
- Low Shutdown Current: 0.2 μA
- High PSRR: 80 dB
- AGC Enable or Disable Function
- Limiter Enable or Disable Function
- Short-Circuit and Thermal Protection
- Space-Saving Package
	- 2.2 mm × 2.2 mm Nano-Free™ DSBGA (YZH)

2 Applications

- Wireless or Cellular Handsets and PDAs
- Portable Navigation Devices
- Portable DVD Players
- Notebook PCs
- Portable Radios
- Portable Games
- **Educational Toys**
- USB Speakers

3 Description

Tools & **Software**

The TPA2026D2 device is a stereo, filter-free Class-D audio power amplifier with volume control, dynamic range compression (DRC), and automatic gain control (AGC). It is available in a 2.2 mm \times 2.2 mm DSBGA package.

Support & **Community**

 22

The DRC and AGC function in the TPA2026D2 is programmable through a digital I²C interface. The DRC and AGC function can be configured to automatically prevent distortion of the audio signal and enhance quiet passages that are normally not heard. The DRC and AGC can also be configured to protect the speaker from damage at high power levels and compress the dynamic range of music to fit within the dynamic range of the speaker. The gain can be selected from 0 dB to +30 dB in 1-dB steps. The TPA2026D2 is capable of driving 3.2 W/Ch at 5 V into an 4-Ω load or 750 mW/Ch at 3.6 V into an 8- Ω load. The device features independent software shutdown controls for each channel and also provides thermal and short-circuit protection. The TPA2026D2 has faster AGC gain ramp during start-up than TPA2016D2.

In addition to these features, a fast start-up time and small package size make the TPA2026D2 an ideal choice for cellular handsets, PDAs, and other portable applications.

8 Parameter Measurement Information

All parameters are measured according to the conditions described in *Specifications*. Figure 31 shows the setup used for the typical characteristics of the test device.

- (1) All measurements were taken with a 1- μ F C_I (unless otherwise noted).
- (2) A 33-μH inductor was placed in series with the load resistor to emulate a small speaker for efficiency measurements.
- (3) The 30-kHz low-pass filter is required, even if the analyzer has an internal low-pass filter. An RC low-pass filter (1 k Ω 4.7 nF) is used on each output for the data sheet graphs.

Figure 31. Test Setup for Graphs

9 Detailed Description

9.1 Overview

The TPA2026D2 is a stereo Class-D audio power amplifier capable of driving 750 mW/Ch into 8-Ω load at 3.6 V and 3.2 W/Ch into 4-Ω load at 5 V. The device features independent software shutdown controls for each channel and also provides thermal and short-circuit protection. In addition to these features, a fast start-up time and small package size make the TPA2026D2 an ideal choice for cellular handsets, PDAs, and other portable applications.

9.2 Functional Block Diagram

9.3 Feature Description

9.3.1 Automatic Gain Control

The Automatic Gain Control (AGC) feature provides continuous automatic gain adjustment to the amplifier through an internal PGA. This feature enhances the perceived audio loudness and at the same time prevents speaker damage from occurring (Limiter function).

The AGC function attempts to maintain the audio signal gain as selected by the user through the Fixed Gain, Limiter Level, and Compression Ratio variables. Other advanced features included are Maximum Gain and Noise Gate Threshold. Table 2 describes the function of each variable in the AGC function.

Table 2. TPA2026D2 AGC Variable Descriptions

STRUMENTS

FXAS

Feature Description (continued)

Table 2. TPA2026D2 AGC Variable Descriptions (continued)

The AGC works by detecting the audio input envelope. The gain changes depending on the amplitude, the limiter level, the compression ratio, and the attack and release time. The gain changes constantly as the audio signal increases and/or decreases to create the compression effect. The gain step size for the AGC is 0.5 dB. If the audio signal has near-constant amplitude, the gain does not change. Figure 32 shows how the AGC works.

- A. Gain decreases with no delay; attack time is reset. Release time and hold time are reset.
- B. Signal amplitude above limiter level, but gain cannot change because attack time is not over.
- C. Attack time ends; gain is allowed to decrease from this point forward by one step. Gain decreases because the amplitude remains above limiter threshold. All times are reset
- D. Gain increases after release time finishes and signal amplitude remains below desired level. All times are reset after the gain increase.
- E. Gain increases after release time is finished again because signal amplitude remains below desired level. All times are reset after the gain increase.

Figure 32. Input and Output Audio Signal vs Time

Because the number of gain steps is limited the compression region is limited as well. Figure 33 shows how the gain changes versus the input signal amplitude in the compression region.

 V_{IN} - dBV

Figure 33. Input Signal Voltage vs Gain

Thus the AGC performs a mapping of the input signal versus the output signal amplitude. This mapping can be modified according to the variables from Table 2.

The following graphs and explanations show the effect of each variable to the AGC independently and which considerations should be taken when choosing values.

9.3.1.1 Fixed Gain

The fixed gain determines the initial gain of the AGC. Set the gain using the following variables:

- Set the fixed gain to be equal to the gain when the AGC is disabled.
- Set the fixed gain to maximize SNR.
- Set the fixed gain such that it will not overdrive the speaker.

Figure 34 shows how the fixed gain influences the input signal amplitude versus the output signal amplitude state diagram. The dotted 1:1 line is displayed for reference. The 1:1 line means that for a 1-dB increase in the input signal, the output increases by 1 dB.

If the Compression function is enabled, the Fixed Gain is adjustable from –28 dB to 30 dB. If the Compression function is disabled, the Fixed gain is adjustable from 0 dB to 30 dB.

SLOS649B –MARCH 2010–REVISED MAY 2016 **www.ti.com**

9.3.1.2 Limiter Level

The Limiter level sets the maximum amplitude allowed at the output of the amplifier. The limiter should be set with the following constraints in mind:

- Below or at the maximum power rating of the speaker
- Below the minimum supply voltage in order to avoid clipping

Figure 35 shows how the limiter level influences the input signal amplitude versus the output signal amplitude state diagram.

Figure 35. Output Signal vs Input Signal State Diagram Showing Different Limiter Level Configurations

The limiter level and the fixed gain influence each other. If the fixed gain is set high, the AGC has a large limiter range. The fixed gain is set low, the AGC has a short limiter range. Figure 36 illustrates the two examples:

Figure 36. Output Signal vs Input Signal State Diagram Showing Same Limiter Level Configurations With Different Fixed Gain Configurations

9.3.1.3 Compression Ratio

The compression ratio sets the relation between input and output signal outside the limiter level region. The compression ratio compresses the dynamic range of the audio. For example if the audio source has a dynamic range of 60 dB and compression ratio of 2:1 is selected, then the output has a dynamic range of 30 dB. Most small form factor speakers have small dynamic range. Compression ratio allows audio with large dynamic range to fit into a speaker with small dynamic range.

The compression ratio also increases the loudness of the audio without increasing the peak voltage. The higher the compression ratio, the louder the perceived audio.

For example:

- A compression ratio of 4:1 is selected (meaning that a 4-dB change in the input signal results in a 1-dB signal change at the output)
- A fixed gain of 0 dB is selected and the maximum audio level is at 0 dBV.

www.ti.com SLOS649B –MARCH 2010–REVISED MAY 2016

When the input signal decreases to -32 dBV, the amplifier increases the gain to 24 dB in order to achieve an output of –8 dBV. The output signal amplitude equation is:

Output signal amplitude =
$$
\frac{Input \text{ signal initial amplitude} - |Current \text{ input signal amplitude}|}{1 - 1}
$$

Compression ratio (1)

TPA2026D2

(4)

In this example:

$$
-8\text{dBV} = \frac{0\text{dBV} - [-32 \text{ dBV}]}{4} \tag{2}
$$

The gain change equation is:

Gain change =
$$
\left(1 - \frac{1}{\text{Compression ratio}}\right) \times \text{Input signal change}
$$
 (3)
24 dB = $\left(1 - \frac{1}{4}\right) \times 32$ (4)

Consider the following when setting the compression ratio:

- Dynamic range of the speaker
- Fixed gain level
- **Limiter Level**
- Audio Loudness vs Output Dynamic Range

Figure 37 shows different settings for dynamic range and different fixed gain selected but no limiter level.

Figure 37. Output Signal vs Input Signal State Diagram Showing Different Compression Ratio Configurations With Different Fixed Gain Configurations

The rotation point is always at V_{IN} = 10 dBV. The rotation point is not located at the intersection of the limiter region and the compression region. By changing the fixed gain the rotation point will move in the y-axis direction only, as shown in the previous graph.

Copyright © 2010–2016, Texas Instruments Incorporated *Submit Documentation Feedback*

9.3.1.4 Interaction Between Compression Ratio and Limiter Range

The compression ratio can be limited by the limiter range.

NOTE

The limiter range is selected by the limiter level and the fixed gain.

For a setting with large limiter range, the amount of gain steps in the AGC remaining to perform compression are limited. Figure 38 shows two examples, where the fixed gain was changed.

- 1. Small limiter range yielding a large compression region (small fixed gain).
- 2. Large limiter range yielding a small compression region (large fixed gain).

Figure 38. Output Signal vs Input Signal State Diagram Showing the Effects of the Limiter Range to the **Compression Region**

9.3.1.5 Noise Gate Threshold

The noise gate threshold prevents the AGC from changing the gain when there is no audio at the input of the amplifier. The noise gate threshold stops gain changes until the input signal is above the noise gate threshold. Select the noise gate threshold to be above the noise but below the minimum audio at the input of the amplifier signal. A filter is needed between delta-sigma CODEC/DAC and TPA2026D2 for effectiveness of the noise gate function. The filter eliminates the out-of-band noise from delta-sigma modulation and keeps the CODEC/DAC output noise lower than the noise gate threshold.

Figure 39. Time Diagram Showing the Relationship Between Input Signal Amplitude, Noise Gate Threshold, and Gain Versus Time

9.3.1.6 Maximum Gain

This variable limits the number of gain steps in the AGC. This feature is useful in order to accomplish a more advanced output signal versus input signal transfer characteristic.

For example, to prevent the gain from going above a certain value, reduce the maximum gain.

However, this variable will affect the limiter range and the compression region. If the maximum gain is decreased, the limiter range and/or compression region is reduced. Figure 40 illustrates the effects.

A particular application requiring maximum gain of 22 dB, for example. Thus, set the maximum gain at 22 dB. The amplifier gain never has a gain higher than 22 dB; however, this reduces the limiter range.

9.3.1.7 Attack, Release, and Hold Time

- The attack time is the minimum time between gain decreases.
- The release time is the minimum time between gain increases.
- The hold time is the minimum time between a gain decrease (attack) and a gain increase (release). The hold time can be deactivated. Hold time is only valid if greater than release time.

TPA2026D2 SLOS649B –MARCH 2010–REVISED MAY 2016 **www.ti.com**

Successive gain decreases are never faster than the attack time. Successive gain increases are never faster than the release time.

All time variables (attack, release, and hold) start counting after each gain change performed by the AGC. The AGC is allowed to decrease the gain (attack) only after the attack time finishes. The AGC is allowed to increase the gain (release) only after the release time finishes counting. However, if the preceding gain change was an attack (gain increase) and the hold time is enabled and longer than the release time, then the gain is only increased after the hold time.

The hold time is only enabled after a gain decrease (attack). The hold time replaces the release time after a gain decrease (attack). If the gain needs to be increased further, then the release time is used. The release time is used instead of the hold time if the hold time is disabled.

The attack time must be at least 100 times shorter than the release and hold time. The hold time must be the same or greater than the release time. It is important to select reasonable values for those variables in order to prevent the gain from changing too often or too slow.

Figure 41 illustrates the relationship between the three time variables.

Figure 41. Time Diagram Showing the Relation Between the Attack, Release, and Hold Time vs Input Signal Amplitude and Gain

Figure 42 shows a state diagram of the input signal amplitude versus the output signal amplitude and a summary of how the variables from Table 2 described in the preceding pages affect them.

Figure 42. Output Signal vs Input Signal State Diagram

9.3.2 Operation With DACS and CODECS

In using Class-D amplifiers with CODECs and DACs, sometimes there is an increase in the output noise floor from the audio amplifier. This occurs when output frequencies of the CODEC/DAC mix with the Class-D switching frequency and create sum or difference components in the audio band. The noise increase can be solved by placing an RC low-pass filter between the CODEC/DAC and audio amplifier. The filter reduces high frequencies that cause the problem and allows proper performance.

If driving the TPA2016D2 input with 4th-order or higher ΔΣ DACs or CODECs, add an RC low-pass filter at each of the audio inputs (IN+ and IN–) of the TPA2016D2 to ensure best performance. The recommended resistor value is 100 $Ω$ and the capacitor value of 47 nF.

9.3.3 Short-Circuit Auto-Recovery

When a short-circuit event happens, the TPA2026D2 goes to low duty cycle mode and tries to reactivate itself every 110 µs. This auto-recovery continues until the short-circuit event stops. This feature can protect the device without affecting the device's long-term reliability. FAULT bit (register 1, bit 3) still requires a write to clear.

9.3.4 Filter-Free Operation and Ferrite Bead Filters

A ferrite bead filter can often be used if the design is failing radiated emissions without an LC filter and the frequency-sensitive circuit is greater than 1 MHz. This filter functions well for circuits that just have to pass FCC and CE because FCC and CE only test radiated emissions greater than 30 MHz. When choosing a ferrite bead, choose one with high impedance at high frequencies, and low impedance at low frequencies. In addition, select a ferrite bead with adequate current rating to prevent distortion of the output signal.

Use an LC output filter if there are low frequency (< 1 MHz) EMI-sensitive circuits or there are long leads from amplifier to speaker. Figure 43 shows typical ferrite bead and LC output filters.

9.4 Device Functional Modes

9.4.1 TPA2026D2 AGC Operation

The TPA2026D2 is controlled by the I^2C interface. The correct start-up sequence is:

- 1. Apply the supply voltage to the AV_{DD} and PV_{DD} (L, R) pins.
- 2. Apply a voltage above V_{IH} to the SDZ pin. The TPA2026D2 powers up the I²C interface and the control logic. By default, the device is in active mode (SWS = 0). After 5 ms the amplifier enables the class-D output stage and become fully operational.

9.4.1.1 AGC Start-Up Condition

The amplifier gain at start-up depends on the following conditions:

- 1. Start-up from hardware reset (EN from 0 to 1): The amplifier starts up immediately at default fixed gain. AGC starts controlling gain once the input audio signal exceeds noise gate threshold.
- 2. Start-up from software shutdown (SWS from 1 to 0): The amplifier starts up immediately at the latest fixed gain during software shutdown, regardless the attack or release time. For example:
	- Audio is playing at fixed gain 6 dB
	- $-$ Devices goes to software shutdown (SWS = 1)
	- Set fixed gain from 6 dB to 12 dB
	- $-$ Remove software shutdown (SWS = 0)
	- Amplifier starts up immediately at 12 dB
- 3. During audio playback with AGC on, gain changes according to attack or release time. For example:
	- Audio is playing at fixed gain 6 dB and 1:1 compression ratio
	- Set fixed gain from 6 dB to 12 dB, at release time 500 ms / 6 dB
	- Amplifier takes 500 ms to ramp from 6 dB to 12 dB
- 4. When SPKR_EN_R = 0, SPKR_EN_L = 0 and SWS = 0, the amplifier is set at fixed gain. The amplifier will start up at fixed gain when either SPKR_EN_R and SPKR_EN_L transitions from 0 to 1.

CAUTION

Do not interrupt the start-up sequence after changing SDZ from V_{IL} to V_{IH} .

Do not interrupt the start-up sequence after changing SWS from 1 to 0.

The default conditions of TPA2026D2 allows audio playback without I²C control. Refer to Table 5 for the entire default conditions.

There are several options to disable the amplifier:

Write SPK_EN_R = 0 and SPK_EN_L = 0 to the register (0x01, 6 and 0x01, 7). This write disables each speaker amplifier, but leaves all other circuits operating.

Device Functional Modes (continued)

- Write SWS = 1 to the register $(0x01, 5)$. This action disables most of the amplifier functions.
- Apply V_{II} to SDZ. This action shuts down all the circuits and has very low quiescent current consumption. This action resets the registers to its default values.

CAUTION

Do not interrupt the shutdown sequence after changing SDZ from V_{H} to V_{II} .

Do not interrupt the shutdown sequence after changing SWS from 0 to 1.

9.4.2 TPA2026D2 AGC Recommended Settings

Table 3. Recommended AGC Settings for Different Types of Audio Source (V_{DD} = 3.6 V)

9.5 Programming

9.5.1 General I ²C Operation

The I²C bus employs two signals, SDA (data) and SCL (clock), to communicate between integrated circuits in a system. The bus transfers data serially one bit at a time. The address and data 8-bit bytes are transferred most significant bit (MSB) first. In addition, each byte transferred on the bus is acknowledged by the receiving device with an *acknowledge* bit. Each transfer operation begins with the master device driving a start condition on the bus and ends with the master device driving a stop condition on the bus. The bus uses transitions on the data terminal (SDA) while the clock is at logic high to indicate start and stop conditions. A high-to-low transition on SDA indicates a start and a low-to-high transition indicates a stop. Normal data-bit transitions must occur within the low time of the clock period. Figure 44 shows a typical sequence. The master generates the 7-bit slave address and the read/write (R/W) bit to open communication with another device, and then waits for an acknowledge condition. The TPA2026D2 holds SDA low during the acknowledge clock period to indicate acknowledgment. When this acknowledgment occurs, the master transmits the next byte of the sequence. Each device is addressed by a unique 7-bit slave address plus R/W bit (1 byte). All compatible devices share the same signals through a bidirectional bus using a wired-AND connection.

An external pullup resistor must be used for the SDA and SCL signals to set the logic high level for the bus. When the bus level is 5 V, use pullup resistors between 1 kΩ and 2 kΩ.

Programming (continued)

There is no limit on the number of bytes that can be transmitted between start and stop conditions. When the last word transfers, the master generates a stop condition to release the bus. A generic data transfer sequence is shown in Figure 44.

9.5.2 Single and Multiple-Byte Transfers

The serial control interface supports both single-byte and multi-byte read/write operations for all registers.

During multiple-byte read operations, the TPA2026D2 responds with data, one byte at a time, starting at the register assigned, as long as the master device continues to respond with acknowledgments.

The TPA2026D2 supports sequential I²C addressing. For write transactions, if a register is issued followed by data for that register and all the remaining registers that follow, a sequential I²C write transaction has occurred. For I²C sequential write transactions, the register issued then serves as the starting point, and the amount of data subsequently transmitted, before a stop or start is transmitted, determines the number of registers written.

9.5.3 Single-Byte Write

As Figure 45 shows, a single-byte data write transfer begins with the master device transmitting a start condition followed by the I²C device address and the read/write bit. The read/write bit determines the direction of the data transfer. For a write data transfer, the read/write bit must be set to 0. After receiving the correct I²C device address and the read/write bit, the TPA2026D2 responds with an acknowledge bit. Next, the master transmits the register byte corresponding to the TPA2026D2 internal memory address being accessed. After receiving the register byte, the TPA2026D2 again responds with an acknowledge bit. Next, the master device transmits the data byte to be written to the memory address being accessed. After receiving the register byte, the TPA2026D2 again responds with an acknowledge bit. Finally, the master device transmits a stop condition to complete the single-byte data write transfer.

Figure 45. Single-Byte Write Transfer

9.5.4 Multiple-Byte Write and Incremental Multiple-Byte Write

A multiple-byte data write transfer is identical to a single-byte data write transfer except that multiple data bytes are transmitted by the master device to the TPA2026D2 as shown in Figure 46. After receiving each data byte, the TPA2026D2 responds with an acknowledge bit.

Figure 46. Multiple-Byte Write Transfer

9.5.5 Single-Byte Read

As Figure 47 shows, a single-byte data read transfer begins with the master device transmitting a start condition followed by the I²C device address and the read/write bit. For the data read transfer, both a write followed by a read are actually executed. Initially, a write is executed to transfer the address byte of the internal memory address to be read. As a result, the read/write bit is set to a 0.

Programming (continued)

After receiving the TPA2026D2 address and the read/write bit, the TPA2026D2 responds with an acknowledge bit. The master then sends the internal memory address byte, after which the TPA2026D2 issues an acknowledge bit. The master device transmits another start condition followed by the TPA2026D2 address and the read/write bit again. This time the read/write bit is set to 1, indicating a read transfer. Next, the TPA2026D2 transmits the data byte from the memory address being read. After receiving the data byte, the master device transmits a *not-acknowledge* followed by a stop condition to complete the single-byte data read transfer.

Figure 47. Single-Byte Read Transfer

9.5.6 Multiple-Byte Read

A multiple-byte data read transfer is identical to a single-byte data read transfer except that multiple data bytes are transmitted by the TPA2026D2 to the master device as shown in Figure 48. With the exception of the last data byte, the master device responds with an acknowledge bit after receiving each data byte.

Figure 48. Multiple-Byte Read Transfer

9.6 Register Maps

Table 4. TPA2026D2 Register Map

NSTRUMENTS

Texas

The default register map values are given in Table 5.

Any register above address 0x08 is reserved for testing and must not be written to because it may change the function of the device. If read, these bits may assume any value.

Some of the default values can be reprogrammed through the I^2C interface and written to the EEPROM. This function is useful to speed up the turnon time of the device and minimizes the number of I^2C writes. If this is required, contact your local TI representative.

The TPA2026D2 I²C address is 0xB0 (binary 10110000) for writing and 0xB1 (binary 10110001) for reading. If a different I ²C address is required, contact your local TI representative. See *General I ²C Operation* for more details.

The following tables show the details of the registers, the default values, and the values that can be programmed through the I²C interface.

					00	1:1 (off)
					01	2:1
					10	4:1
					11	8:1

Table 12. AGC Control (Address: 7)

Compression Ratio These bits select the compression ratio. Output Limiter is enabled by default when the compression ratio is not 1:1.

Max Gain These bits select the maximum gain of the amplifier. In order to maximize the use of the AGC, set the Max Gain to 30 dB

10 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

10.1 Application Information

These typical connection diagrams highlight the required external components and system level connections for proper operation of the device. Each of these configurations can be realized using the Evaluation Modules (EVMs) for the device. These flexible modules allow full evaluation of the device in the most common modes of operation. Any design variation can be supported by TI through schematic and layout reviews. Visit e2e.ti.com for design assistance and join the audio amplifier discussion forum for additional information.

10.2 Typical Applications

10.2.1 TPA2026D2 With Differential Input Signals

Figure 49. Typical Application Schematic With Differential Input Signals

10.2.1.1 Design Requirements

For this design example, use the parameters listed in Table 13.

Table 13. Design Procedure

PARAMETER	EXAMPLE VALUE		
Power supply	5 V		
	High > 1.3 V		
Enable inputs	Low $< 0.6 V$		
Speaker	8Ω

10.2.1.2 Detailed Design Procedure

10.2.1.2.1 Surface Mount Capacitor

Temperature and applied DC voltage influence the actual capacitance of high-K materials. Table 14 shows the relationship between the different types of high-K materials and their associated tolerances, temperature coefficients, and temperature ranges. Notice that a capacitor made with X5R material can lose up to 15% of its capacitance within its working temperature range.

In an application, the working capacitance of components made with high-K materials is generally much lower than nominal capacitance. A worst-case result with a typical X5R material might be –10% tolerance, –15% temperature effect, and –45% DC voltage effect at 50% of the rated voltage. This particular case would result in a working capacitance of 42% (0.9 \times 0.85 \times 0.55) of the nominal value.

Select high-K ceramic capacitors according to the following rules:

- 1. Use capacitors made of materials with temperature coefficients of X5R, X7R, or better.
- 2. Use capacitors with DC voltage ratings of at least twice the application voltage. Use minimum 10-V capacitors for the TPA2026D2.
- 3. Choose a capacitance value at least twice the nominal value calculated for the application. Multiply the nominal value by a factor of 2 for safety. If a 10-μF capacitor is required, use 20 µF.

The preceding rules and recommendations apply to capacitors used in connection with the TPA2026D2. The TPA2026D2 cannot meet its performance specifications if the rules and recommendations are not followed.

MATERIAL	COG/NPO	X7R	X5R
Typical tolerance	±5%	$±10\%$	$80/-20%$
Temperature	$±30$ ppm	±15%	$22/-82%$
Temperature range	-55 to 125°C	-55 to 125°C	-30 to 85 \degree C

Table 14. Typical Tolerance and Temperature Coefficient of Capacitance by Material

10.2.1.2.2 Decoupling Capacitor, C_S

The TPA2026D2 is a high-performance Class-D audio amplifier that requires adequate power supply decoupling to ensure the efficiency is high and total harmonic distortion (THD) is low. For higher frequency transients, spikes, or digital hash on the line, a good low equivalent-series-resistance (ESR) 1-μF ceramic capacitor (typically) placed as close as possible to the device PVDD (L, R) lead works best. Placing this decoupling capacitor close to the TPA2026D2 is important for the efficiency of the Class-D amplifier, because any resistance or inductance in the trace between the device and the capacitor can cause a loss in efficiency. For filtering lowerfrequency noise signals, a 4.7 μF or greater capacitor placed near the audio power amplifier would also help, but it is not required in most applications because of the high PSRR of this device.

10.2.1.2.3 Input Capacitors, C^I

The input capacitors and input resistors form a high-pass filter with the corner frequency, f_C , determined in Equation 5.

$$
f_{\rm C} = \frac{1}{(2\pi \times R_1 \times C_1)}
$$

The value of the input capacitor is important to consider as it directly affects the bass (low frequency) performance of the circuit. Speakers in wireless phones cannot usually respond well to low frequencies, so the corner frequency can be set to block low frequencies in this application. Not using input capacitors can increase output offset. Equation 6 is used to solve for the input coupling capacitance. If the corner frequency is within the audio band, the capacitors must have a tolerance of $±10%$ or better, because any mismatch in capacitance causes an impedance mismatch at the corner frequency and below.

$$
C_1 = \frac{1}{(2\pi \times R_1 \times f_C)}
$$

10.2.2 TPA2026D2 With Single-Ended Input Signal

Figure 50. Typical Application Schematic With Single-Ended Input Signal

10.2.2.1 Design Requirements

For this design example, use the parameters listed in Table 13.

10.2.2.2 Detailed Design Procedure

For the design procedure see *Detailed Design Procedure* from the previous section

10.2.2.3 Application Curves

For application curves, see the figures listed in Table 15.

11 Power Supply Recommendations

The TPA2026D2 is designed to operate from an input voltage supply range between 2.5 V and 5.5 V. Therefore the output voltage range of the power supply should be within this range. The current capability of upper power must not exceed the maximum current limit of the power switch.

11.1 Power Supply Decoupling Capacitors

The TPA2026D2 requires adequate power supply decoupling to ensure a high efficiency operation with low total harmonic distortion (THD). Place a low equivalent-series-resistance (ESR) ceramic capacitor, typically 0.1 µF, within 2 mm of the VDD/VCCOUT pin. This choice of capacitor and placement helps with higher frequency transients, spikes, or digital hash on the line. In addition to the 0.1-μF ceramic capacitor, is recommended to place a 2.2-µF to 10-µF capacitor on the VDD supply trace. This larger capacitor acts as a charge reservoir, providing energy faster than the board supply, thus helping to prevent any droop in the supply voltage.

12 Layout

12.1 Layout Guidelines

12.1.1 Pad Size

In making the pad size for the WCSP balls, TI recommends that the layout use non solder mask-defined (NSMD) land. With this method, the solder mask opening is made larger than the desired land area, and the opening size is defined by the copper pad width. Figure 51 and Table 16 show the appropriate diameters for a WCSP layout. The TPA2026D2 evaluation module (EVM) layout is shown in *Layout Example*.

Figure 51. Land Pattern Dimensions

FXAS

Layout Guidelines (continued)

Table 16. Land Pattern Dimensions(1) (2) (3) (4)

(1) Circuit traces from NSMD defined PWB lands should be 75 μm to 100 μm wide in the exposed area inside the solder mask opening. Wider trace widths reduce device stand off and impact reliability.

(2) Best reliability results are achieved when the PWB laminate glass transition temperature is above the operating the range of the intended application.

(3) Recommend solder paste is Type 3 or Type 4.

(4) For a PWB using a Ni/Au surface finish, the gold thickness must be less 0.5 mm to avoid a reduction in thermal fatigue performance.

(5) Solder mask thickness must be less than 20 μm on top of the copper circuit pattern

(6) Best solder stencil performance is achieved using laser cut stencils with electro polishing. Use of chemically etched stencils results in inferior solder paste volume control.

(7) Trace routing away from WCSP device must be balanced in X and Y directions to avoid unintentional component movement due to solder wetting forces.

12.1.2 Component Location

Place all external components very close to the TPA2026D2. Placing the decoupling capacitor, C_{S} , close to the TPA2026D2 is important for the efficiency of the Class-D amplifier. Any resistance or inductance in the trace between the device and the capacitor can cause a loss in efficiency.

12.1.3 Trace Width

Recommended trace width at the solder balls is 75 μm to 100 μm to prevent solder wicking onto wider PCB traces. For high current pins (PVDD (L, R), PGND, and audio output pins) of the TPA2026D2, use 100-μm trace widths at the solder balls and at least 500-μm PCB traces to ensure proper performance and output power for the device. For the remaining signals of the TPA2026D2, use 75-μm to 100-μm trace widths at the solder balls. The audio input pins ($INR_±$ and $INL_±$) must run side-by-side to maximize common-mode noise cancellation.

12.2 Layout Example

Figure 52. Layout Recommendation

12.3 Efficiency and Thermal Considerations

The maximum ambient temperature depends on the heat-sinking ability of the PCB system. The derating factor for the package is shown in the dissipation rating table. Converting this to θ_{JA} for the DSBGA package:

$$
\theta_{JA} = \frac{1}{\text{Derating Factor}} = \frac{1}{0.01} = 100^{\circ} \text{C/W}
$$

(7)

Given θ_{JA} of 100°C/W, the maximum allowable junction temperature of 150°C, and the maximum internal dissipation of 0.4 W (0.2 W per channel) for 1.5 W per channel, 8-Ω load, 5-V supply, from Figure 15, the maximum ambient temperature can be calculated with the following equation.

$$
T_A \text{Max} = T_J \text{Max} - \theta_{JA} P_{\text{DMAX}} = 150 - 100 (0.4) = 110^{\circ} \text{C}
$$
 (8)

Equation 8 shows that the calculated maximum ambient temperature is 110°C at maximum power dissipation with a 5-V supply and 8-Ω a load. The TPA2026D2 is designed with thermal protection that turns the device off when the junction temperature surpasses 150°C to prevent damage to the IC. Also, using speakers more resistive than 8-Ω dramatically increases the thermal performance by reducing the output current and increasing the efficiency of the amplifier.

13 Device and Documentation Support

13.1 Device Support

13.1.1 Third-Party Products Disclaimer

TI'S PUBLICATION OF INFORMATION REGARDING THIRD-PARTY PRODUCTS OR SERVICES DOES NOT CONSTITUTE AN ENDORSEMENT REGARDING THE SUITABILITY OF SUCH PRODUCTS OR SERVICES OR A WARRANTY, REPRESENTATION OR ENDORSEMENT OF SUCH PRODUCTS OR SERVICES, EITHER ALONE OR IN COMBINATION WITH ANY TI PRODUCT OR SERVICE.

13.2 Community Resources

The following links connect to TI community resources. Linked contents are provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's Terms of Use.

TI E2E™ Online Community *TI's Engineer-to-Engineer (E2E) Community.* Created to foster collaboration among engineers. At e2e.ti.com, you can ask questions, share knowledge, explore ideas and help solve problems with fellow engineers.

Design Support *TI's Design Support* Quickly find helpful E2E forums along with design support tools and contact information for technical support.

13.3 Trademarks

SmartGain, Nano-Free, E2E are trademarks of Texas Instruments. All other trademarks are the property of their respective owners.

13.4 Electrostatic Discharge Caution

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

13.5 Glossary

SLYZ022 — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

14 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

14.1 YZH Package Dimensions

The package dimensions for this YZH package are shown in the table below. See the package drawing at the end of this data sheet for more details.

www.ti.com 10-Dec-2020

PACKAGING INFORMATION

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

⁽²⁾ RoHS: TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures. "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (CI) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer:The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.
